PREFACE

This issue of The American Year Book contains the record of the first full calendar year of nominal peace since 1939. The term *peace* is used advisedly to distinguish the year 1946 from the preceding years of combat warfare. In other connotations of the word, its employment tends to be not a little ironical. The record shows that there has been more strife than peace in the industrial world and in the political world as well. Whether this state of affairs portends revolutionary change or a beginning in evolutionary change remains for the future to reveal. The record as set down in this volume can at this time show only the events as they have developed through the twelve months, with such interpretation as may be prudently ventured upon amid rapidly shifting scenes and the generally unstable outlook. Nevertheless this record has definite value in its presentation of actions and reactions as a guide to possible trends for readers of the present and as source material for historians of the future.

The narrative as a whole is neither satisfactorily encouraging nor completely discouraging. Primarily it reveals a consistent and forceful struggle for solution of national social and industrial problems and for adjustment of international differences in political ideologies. Such a struggle is the core of progress. It brings into the open questions of high import that must eventually be answered definitively. It is deceptive to be discouraged by the intensity of the struggle as it is complacent to be encouraged by the falsity of appeasement. Neither attitude is justified by the events of the day. The merits of the case, national and international, are the basis for guidance and study. Labor in this country has become militant under the stress of rising prices and social maladjustments. The strike picture, therefore, looms large in the narrative. Some of the coloring is bright, some is dismal. Time will doubtless tone down the one and mitigate the other. The same applies to the price picture though in lesser degree since controls with a few exceptions have been removed. Housing, production, public works construction, and financial burdens imposed by foreign relief, international trade revival, and maintenance of service forces abroad, are factors pervading most of the multifarious activities reported in this volume.

In the political field, the year 1946 was a year of profound significance. With the establishment of the seat of the United Nations in New York and vicinity, the United States became in a sense the world capital, bringing to this country a remarkable assemblage of political figures and cultural experts from all over the world. The labors of the Foreign Ministers in their searching quest for permanent peace formulas are duly recorded. The November elections focused the world's attention on our immediate political future. The elections seemed to express a phase of war weariness that demands change in the hope that change can not make a bad situation worse and may make it better. The makers of The American Year Book have striven to present a practical compendium of the year's events to which allusion has been made here and of the many other events which the limitations of this preface necessarily exclude.

OFFICERS OF THE AMERICAN YEAR BOOK CORPORATION x

CONSTITUENT SOCIETIES AND SUPERVISORY BOARD xi

CONTRIBUTORS xv

PART ONE: POLITICAL—NATIONAL AND INTERNATIONAL

DIVISION PAGE

I. AMERICAN POLITICAL HISTORY 1
The President and His Policies.—National Personalities.—The Year in Congress.—The Supreme Court and Constitutional Law.—Federal Administrative Agencies.—Elections of 1946.

II. INTERNATIONAL AFFAIRS AFFECTING THE UNITED STATES . . 74
The United Nations.—The United States and the Peace Treaties.—The United States and Europe.—Occupied Japan.—The Republic of the Philippines.—The United States and Latin America.—The United States and the Middle East.—Foreign Service of the United States.—Dissolution of the League of Nations.—Chronology of International Affairs.

PART TWO: AMERICAN GOVERNMENT

III. THE NATIONAL GOVERNMENT 155
Federal Administrative Organization.—Members of the Senate and House of Representatives.—Federal Judicial Organization.—Civil Service in the United States.

IV. STATE GOVERNMENT 173
State Administration and Legislation.—National and Interstate Relations of States.—State Constitutions, Referenda, and Initiatives.—Electoral Legislation.—County Government.

V. MUNICIPAL GOVERNMENT 206
New York City Affairs.—Municipal Political Trends.—Municipal Functions.

VI. TERRITORIES AND SPHERES OF AMERICAN INFLUENCE . . . 225
Alaska.—Hawaii.—Puerto Rico.—Virgin Islands of the United States.—Guam and American Samoa.—District of Columbia.

PART THREE: GOVERNMENTAL FUNCTIONS

DIVISION PAGE

VII. Public Finance and Taxation . . . 249
National Finance and the Public Debt.—State Finance and Taxation.—Municipal Finance.—Federal Income and Profits Taxes.—Land and Property Taxes.—Corporation and Bank Taxes.—Estate and Inheritance Taxes.—Automobile Taxes.

VIII. Public Resources and Utilities 286
Federal Surveys and Maps.—State Geological Surveys.—Reclamation and Irrigation.—Public Lands.—Public Utilities.—Water Supply.—Street and Highway Traffic.

IX. Defense and Armament 342
The United States Army.—Administration of Veterans Affairs.—Naval Construction and Equipment.—Waterways and Harbors.

PART FOUR: ECONOMICS AND BUSINESS

X. Business and Finance . . 382
Economic and Business Conditions.—The Security and Money Markets.—Banking Affairs.—Trust Business.—Foreign Exchange.—Foreign Trade.—Foreign Trade Policies.—Public Accounting.—Life Insurance.—Fire Insurance.—Marine Insurance.—Casualty Insurance and Corporate Suretyship.

XI. Agriculture and Allied Industries . 458
Conditions in Agriculture.—Cotton, Grain and Other Field Crops.—The Dairy Industry.—Insect Pests and Plant Quarantines.—Fisheries.—Forestry.

XII. Mineral Industries 500
Gold, Silver and Platinum.—Iron and Steel.—Non-Ferrous Metals.—Petroleum.

XIII. Manufactures and Transportation . 521
Conditions in Manufacturing.—The United States Tariff Commission.—Administration of Tariff Laws.—Railroads.—Highways.—The Motor Bus Industry.—Community Transit.—The Merchant Marine.—Commercial Aviation.

PART FIVE: SOCIAL CONDITIONS AND AIMS

XIV. Population and Migration 575
Population Statistics.—Race Conditions in the United States.—American Indian Affairs.

XV. Social Problems and Conditions . 601
Public Social Work and Welfare.—Housing.—Prisons and Crime Control.

XVI. Labor and Labor Legislation 621
Labor Conditions and Legislation.—Employment and Unemployment Statistics.—Child Labor.

TABLE OF CONTENTS

DIVISION PAGE

XVII. RELIGION AND RELIGIOUS ORGANIZATIONS 654
Interdenominational Activities.—Protestant Denominational Activities.—The Roman Catholic Church.—The Eastern Churches.—Judaism and Jewish Communal Affairs.

PART SIX: SCIENCE—APPLICATION AND PRINCIPLES

XVIII. MATHEMATICS AND ASTRONOMY 695
Mathematics.—Statistical.—Analytical.—Astronomy.—Astronomers and Observatories.—Radar and the Moon.—Solar Observations from Rockets.—Lunar Occultations of Stars.—Cosmic Events.

XIX. ENGINEERING AND CONSTRUCTION 708
Structural Engineering.—Mechanical Engineering.—Electrical Engineering.—Radio.—Technical Progress in Sound Equipment.—Naval Architecture and Marine Engineering.

XX. GEOPHYSICAL SCIENCES 751
Earthquakes and Volcanoes.—Mineralogy and Petrography.—Terrestrial Magnetism and Electricity.—Meteorology and Climatology.—American Exploration.—Oceanography.

XXI. CHEMISTRY AND PHYSICS 776
Physical Chemistry.—Physics.—Organic and Inorganic Chemistry.—Electrochemistry.

XXII. BIOLOGY 797
Organic Evolution and Genetics.—Entomology.—Botany.—Economic Botany.

XXIII. MEDICAL SCIENCES 822
Medicine. — Pathology. — Physiology. — Surgery. — Public Health.—Dentistry.—Vital Statistics.

XXIV. PSYCHOLOGY AND PHILOSOPHY 856
Psychology.—Philosophy.—Anthropology and Ethnology.

PART SEVEN: THE HUMANITIES

XXV. LITERATURE AND LANGUAGE 873
Fiction.—Poetry.—History.—Biography.—Travel.—Criticism and Belles Lettres.—English Language and Literature.—Germanic Languages and Literatures.—Romance Languages and Literatures.—Latin Literature.—Greek Literature.—Semitic Languages and Literatures.—Slavic Languages and Literatures.—Indo-European Linguistics.

XXVI. THE ARTS 949
Archaeology.—Painting.—Sculpture.—Music and the Opera.—The Theatre.—Motion Pictures.

XXVII. EDUCATION 993
Elementary Education.—Secondary Education.—Higher Education.—Education for the Professions.—Adult Education.—Negro Education.—Libraries.

AMERICAN POLITICAL HISTORY

THE PRESIDENT AND HIS POLICIES

By Everett S. Brown
Professor, University of Michigan

URGES PUBLIC SUPPORT OF PROGRAM

In a radio address to the American people on Jan. 3, 1946, President Truman discussed the issues before Congress, declaring bluntly that in 1946 we would "lay the foundation of our economic structure which will have to serve for generations." Praising Congress for its cooperation in carrying out our foreign policy, the President criticized it for failure to take action on his recommendations in the domestic field, particularly as related to the settlement of industrial disputes, price control, extension of the Second War Powers Act, full employment, unemployment insurance, fair employment practices, minimum wages, comprehensive scientific research, universal training, health and medical care, adequate salaries for Federal employees, presidential succession, and river valley development.

The President urged the people to tell Congressmen their views concerning the problems facing the country.

STATE OF THE NATION—BUDGET MESSAGE

On Jan. 21, 1946 President Truman sent to Congress a 25,000-word document, combining his annual message on the state of the nation with his budget message. He termed establishment of a fair wage structure the most serious difficulty in the path of reconversion and expansion. He said that labor and management must establish better human relationships, adding that, while "no government policy can make men understand each other, agree, and get along unless they conduct themselves in a way to foster mutual respect and good will," the Government could help to develop machinery which, supported by public opinion, would assist labor and management to settle their disagreements in a peaceful manner and reduce the number and duration of strikes. Full employment and greater production were the keynotes of his recommendations.

Besides asking Congress to act on a revised 21-point legislative program which he had hitherto submitted, the President recommended these additional measures: 1—Extension of the price control act for one year from next June 30; 2—Extension of the second war powers act, including priority and inventory controls, beyond June 30, presumably another six months; 3—Continuation of food subsidies beyond June 30 with the proviso that they stop if the cost of living declined below present levels; 4—Legislation creating a permanent housing agency; and 5—Extension of the Selective Service Act beyond the present expiration date of May 16, "in case the campaign for volunteers does not produce" the needed number, the President calling for action on this before April.

In foreign affairs, President Truman told Congress the United States was entering upon a new international era in which many concessions and adjustments would be required and in which the United Nations Organization had to be recognized as the representative of the world as one society. He made it clear that "when difficulties arise among us, the United States does not propose to remove them by sacrificing its ideals or its vital interests." However, he explained the United States did not propose to ignore the ideals and vital interests of its friends. With respect to the smaller nations he said that in peacemaking the smaller nations should have a voice as well as the larger states. He repeated that the 12 points he outlined in his Navy Day speech in New York in 1945 would continue to be the basis of American foreign policy.

A Federal budget for the 1947 fiscal year totaling $35,860,000,000, against anticipated revenues of $31,512,000,000, was recommended to Congress. According to the President, a deficit would be avoided by the use of $4,348,000,000 from the Treasury cash balance, so there would be no addition to the public debt. The President warned against further tax reduction. He said that any such reduction must depend on the budgetary and economic situations. Ill-advised tax reduction would, in his opinion, operate to strengthen dangerously powerful inflationary pressures.

TERRITORIES AND POSSESSIONS

The President urged that Congress promptly take action to admit Hawaii to statehood in the Union, and that similar action be taken with respect to Alaska as soon as it was certain that this was the desire of the people of that territory.

He repeated an earlier recommendation that means be provided by which the people of Puerto Rico might choose their form of government and ultimate status with respect to the United States. He urged that the people of the Virgin Islands be given an increasing measure of self-government, and also that legislation be passed to aid economic rehabilitation for the Philippines. He recommended a greater measure of local self-government for the District of Columbia, including the franchise.

ICKES-PAULEY CONTROVERSY

In a caustic exchange of letters, Harold L. Ickes resigned as Secretary of the Interior and President Truman promptly accepted the resignation, making it effective Feb. 15, 1946, instead of March 31, as Secretary Ickes at first suggested. The resignation was the aftermath of Secretary Ickes' testimony before the Senate Naval Affairs Committee, in which he had charged that Edwin W. Pauley, whose nomination by President Truman for the post of Under Secretary of the Navy was being scrutinized, had tried to get him to drop Federal action for title to oil-bearing tidelands by holding out the promise of large Democratic campaign contributions by California oil men. Ickes characterized this as the "rawest proposition" ever made to him. Pauley, also testifying before the Senate committee, said Ickes was mistaken, and President

Truman sided with Pauley. Ickes thereupon resigned, bluntly declaring that "he did not care to stay in an Administration where he was expected to commit perjury for the sake of the party."

In the face of mounting criticism, Pauley, on March 13, asked the President to withdraw his nomination as Under Secretary of the Navy and the President complied. In a surprise move, he nominated J. A. Krug, former head of the War Production Board, as Secretary of the Interior, a nomination which won the speedy approval of the Senate.

FOOD RELIEF

The President issued a statement Feb. 6, 1946, calling upon the people of the United States to conserve food, particularly wheat products, in order that more food might be sent to the starving peoples of Europe. He stated that the use of wheat in the direct production of alcohol and beer would be discontinued and the use of other grains for the production of beverage alcohol would be limited.

On Feb. 27 President Truman sent telegrams to 12 civic leaders asking them to participate in a White House meeting on March 1 to plan a campaign for public support of a voluntary program of reduced food consumption in the United States in order to increase shipments to famine-ridden countries of Europe and Asia. He named former President Herbert Hoover as honorary chairman of this committee. In order to obtain a first-hand picture of the famine situation, Mr. Hoover made a 35,000-mile trip by plane, visiting 25 countries and receiving information from several more. Upon his return he was asked by President Truman to undertake a further journey to the Latin-American countries.

INTER-AMERICAN DEFENSE

On May 6, 1946, the President submitted to Congress a bill to be entitled "The Inter-American Cooperation Act," authorizing a program of military collaboration with other American States, including the training, organization, and equipment of the armed forces of those countries. Under the provisions of the proposed bill the President would also be authorized to transfer military and naval equipment to the governments of other American States by sale or other method.

According to the President, the bill was drawn up primarily to enable the American nations to carry out their obligations to cooperate in the maintenance of inter-American peace and security under the United Nations Charter and the Act of Chapultepec.

FOREIGN POLICY

In his Army Day address in Chicago on April 6, 1946, President Truman proclaimed a new universal foreign policy designed to oppose aggression the world over, and called for strong military forces to back it up. He declared that the United States must remain strong to preserve peace and protect the weak from outside coercion or penetration. He urged upon Congress the unification of all our armed forces in a single department, temporary extension of the Selective Service Act, and universal training.

The President said that the immediate goal of our foreign policy was to support the United Nations to the utmost. In the Far East our program accordingly was designed to combat and remedy the conditions which made it possible for Japan to attack her neighbors. Part of our strategy of peace is to assist in the rehabilitation and development of Far Eastern countries by extending credits and technical assistance to them. Stressing the importance of the Near Eastern region, the President asserted that the United Nations had "a right to insist that the sovereignty and integrity of the countries of the Near and Middle East must not be threatened by coercion or penetration." For Europe, the President urged the sending of food, machinery, and raw materials. He opposed any return "to the kind of narrow economic nationalism which poisoned international relations and undermined living standards between the two World Wars." He expressed the hope that Congress would approve the financial agreements with Great Britain, not merely to aid Great Britain, but because they were of vital importance to the United States as a means of opening the channels of world trade to American enterprise.

With respect to the Western Hemisphere, President Truman said the United States intended "to join with other sovereign republics of America in a regional pact to provide a common defense against attack." Regarding the control of atomic energy as the greatest challenge resulting from the war, he stated that this country had joined with all the United Nations in a determined effort to devise international action to turn the new force to the service, and not the destruction, of mankind.

DEVELOPMENT AND CONTROL OF ATOMIC ENERGY

President Truman, in a letter of Feb. 2, 1946 to Senator McMahon of Connecticut, urged speedy action on legislation for the domestic development and control of atomic energy. He favored establishment of a committee of three, composed exclusively of civilians, and government ownership and production of fissionable materials, with devices utilizing atomic energy to be made available for private development through licensing of patents and regulation of royalty fees, thus assuring genuine freedom to conduct independent research.

On Oct. 28, President Truman named a commission of five civilians to control the atom bomb. Those appointed were David E. Lilienthal (chairman), Lewis L. Strauss, William W. Waymack, Robert F. Bacher, and Sumner T. Pike. In naming them the President pledged unbending efforts to avoid an atomic war and asserted that mastery of the nuclear force would be used for the good of mankind.

THE LOAN TO BRITAIN

On Jan. 30, 1946, President Truman urged Congress to act promptly on the proposed loan to Great Britain of $3,750,000,000. Declaring that Great Britain needed the credit at once, the President said that it would assist her to meet the expected deficit in her balance of payments during the coming six years and enable her to buy from the world the supplies of food and raw materials essential to the life and work of the British people. He asserted that it would keep open a market for the surpluses of the United States which are customarily exported to the United Kingdom. Furthermore, the President declared, such financial assistance would make it possible for the United States and Great Britain to agree on a course of action which would result in the removal of emergency controls over foreign exchange and discriminatory import restrictions and the re-establishment of peacetime practices designed to promote the recovery of world trade.

FOREIGN LOANS

Transmitting to Congress on March 1, 1946 a report by the National Advisory Council on International Monetary and Financial Problems, President Truman endorsed a policy which limited foreign loans by the United States to $3,250,000,000 until June 30, 1947, excluding the $3,750,000,000 British credit then before Congress. In an accompanying message the President said he would ask Congress to raise the lending authority of the Export-Import Bank by an additional $1,250,000,000, which, with the residual margin of $2,000,000,000, would comprise the contemplated ceiling of $3,250,000,000. The President characterized the successful execution of this policy, which included the implimentation of the financial agreement with Great Britain, as of basic importance to the attainment of the objectives of the economic foreign policy of the United States.

STORM OVER FOREIGN POLICY

A speech made by Secretary of Commerce Henry A. Wallace in Madison Square Garden in New York on Sept. 12 caused a great deal of criticism of President Truman. At a press conference in the afternoon preceding the delivery of the speech, the President said that the speech represented the policy of the Administration. This comment aroused worldwide interest because it was generally felt that the policy laid down by Wallace differed widely from that enunciated by Secretary of State Byrnes at Stuttgart. Diplomats in every country began asking whether the United States was switching from support of Great Britain to a new and friendlier attitude toward Russia. In an attempt to still the controversy, President Truman called a special news conference and issued a statement declaring that there had been no change in the established foreign policy of the Government. He added that his remarks previous to the delivery of the speech by Secretary Wallace had been misconstrued. He had intended to express his approval of the right of Wallace to deliver the speech and not to indicate that he had approved it as a statement of the foreign policy of the country.

Publication a few days later of a letter written by Secretary Wallace to President Truman on July 23, in which Wallace reviewed at length his views on foreign policy, brought again to public attention the division in the President's Cabinet. On Sept. 20, the President asked for Secretary Wallace's resignation. In announcing his action, President Truman declared that the Government of the United States must stand as a unit in its relations with the rest of the world. He said that "our foreign policy as established by the Congress, the President and the Secretary of State remains in full force and effect without change." He expressed his complete confidence in Secretary of State Byrnes.

The President almost immediately named W. Averell Harriman, Ambassador to Great Britain and former Ambassador to Soviet Russia, to the post made vacant by the forced resignation of Secretary Wallace. Harriman declared that he fully supported the foreign policy of President Truman and Secretary of State Byrnes.

PALESTINE POLICY

President Truman issued a statement on Oct. 4 urging Prime Minister Attlee to open Palestine at once to substantial immigration of displaced Jews and pledging the support of the United States Government for the formation of a separate Jewish state in part of the Holy Land. Expressing regret over the adjournment until December of the London conference on Palestine, the President said that refuge for displaced Jews could not wait until winter arrived. He added that he would request Congress for a loosening of United States immigration laws to permit the admission into this country of an unspecified number of displaced persons. He also asked other countries to modify their entry restrictions.

In a letter of Oct. 28 to King Ibn Saud of Saudi Arabia, the President again urged the establishment of a Jewish national home in Palestine and the immediate admission of 100,000 displaced Jews there. Denying that there had been any inconsistency in the Administration's policy, the President recalled that the United States Government had pledged not to take any action hostile to the Arab people. He promised that no fundamental decision on Palestine would be taken without prior consultation with both Jews and Arabs.

POLICY TOWARD UNITED NATIONS ORGANIZATION

When on March 19, 1946 he transmitted to Congress a copy of the report of the activities of the American delegation to the first part of the first session of the General Assembly of the United Nations in London, Jan. 10 to Feb. 14, submitted by Secretary of State Byrnes, President Truman declared emphatically that the United States supported the Charter and sought to achieve its purposes.

Declaring that it would be a world disaster if the United Nations should be divided into irreconcilable parts by different political philosophies, President Truman in his address delivered at the opening session of the General Assembly in New York on Oct. 23, called on that body to set an example of mutual give-and-take for the Big Four. In the course of his address he laid down a definite American program for the session of the General Assembly. This program included agreement on international control of atomic energy and other weapons of mass destruction, establishment of an international police force, and more progress in establishing the International Refugee Organization and other United Nations agencies intended to give the world freedom from want.

The President stressed the point that he considered freedom from fear of war the prime necessity for the world. Asserting that the American people were troubled by the failure of the Allies to make more rapid progress in their search for lasting peace. he drew a distinction between the work of making peace and that of keeping peace after treaties had been concluded. He said that the United Nations could not fulfill its own responsibilities until the foundations of permanent peace had been made by treaties with enemy countries but added this responsibility had been assigned to the Allies, as distinguished from the United Nations. In this connection, the President pledged that the United States would insist upon peace terms which "insured that both Germany and Japan remain disarmed. that Nazi influence in Germany be destroyed and that the power of the war lords in Japan be eliminated forever." Admitting that the war had left many parts of the world in turmoil and that it would not help to pretend that there were no differences among the Allies, he insisted that it was not necessary to exaggerate the differences and that no difference of interest or economic, social, and political systems should be allowed to stand in the way of peace. He promised that the United States would support the United Nations to the full extent of its resources.

PACIFIC BASES

Speaking through his press secretary, Charles G. Ross, President Truman on Nov. 3 reaffirmed his policy over the holding by the United States of bases in the Pacific regarded as needed for security. At a press conference in the previous January, the President had stated as a general proposition that the United States intended to have sole trusteeship over such islands.

POLICY TOWARD CHINA

On Dec. 18 President Truman issued a statement reiterating the policy of the United States toward China and pledging a continuation of American efforts to bring peace and prosperity to that country while avoiding involvement in its internal conflicts. The President praised highly the work done by General George C. Marshall and said the general would remain in China as long as necessary to get his job done. He expressed regret that China had not been able to achieve unity by peaceful methods but continued to hope that a peaceful solution would be found to China's internal problem.

ARMY-NAVY MERGER

On June 14, 1946, President Truman submitted to Congress a plan to merge the armed forces in a single department of National Defense under a Secretary of National Defense as a Cabinet member. Under the Secretary would be secretaries for the Army, Navy, and Air Force, who would serve on a Council of National Defense. The Marine Corps would be maintained within the Navy with its own supporting aircraft. The Council of National Defense would include the Secretary of State, the Secretary of National Defense, the Secretaries for Army, Navy, and Air Force, and the chairman of a proposed National Security Resources Board. The Resources Board would be under the Council and include representatives of Government agencies other than military. The joint Chiefs of Staff would formulate strategic plans, integrate military programs, recommend integration of military budgets and provide for strategic direction of all the military forces. A central intelligence agency, and separate agencies of procurement and supply, coordination of scientific research and development, and for review of systems of education and training of personnel would be established.

NEW DRAFT LAW

Denouncing the hastily passed compromise draft law which exempted 18- and 19-year-olds, President Truman, on May 16, appealed to Congress to act before July 1 to extend selective service for a year in a form that would meet the nation's requirements. He authorized the induction into the armed services of childless men 26 through 29 years old. On Dec. 19 he named a nine-member commission to investigate and submit recommendations on a system of military training.

VETO OF TIDELAND BILL

On Aug. 1 President Truman vetoed the tidelands bill and thereby terminated a long battle to determine by legislation the title of the states to lands underlying tidal waters. President Truman based his veto message on the Government's suit against the State of California, which was still pending before the United States Supreme Court. He stated ownership of the vast quantity of oil contained in land underlying the three-mile coastal belt presented a vital problem for the nation from the standpoint of national defense and conservation, and declared that Congress was not an appropriate forum to determine the legal issue.

WAGE-PRICE POLICY

On Feb. 14, 1946, President Truman modified the national wage-policy "to permit wage increases within certain limits and to permit any industry placed in a hardship position by an approved increase to seek price adjustments without waiting until the end of the six-month period." He emphasized that if the general price level was to remain stable in the next few critical months the immediate price relief in such cases must be conservatively appraised. Taking recognition of the general pattern of wage increases since V-J Day, he authorized the National Wage Stabilization Board to approve any wage increases consistent with that pattern. He explained that where there was no general pattern, his order provided for approval of increases found necessary to eliminate gross inequities between related industries, or to correct substandards of living, or to correct disparities between the increase in wage rates since January, 1941, and the increase in living costs between that date and September, 1945. He warned, however, that the program was not to be interpreted as permitting indiscriminate wage increases.

SEIZURE OF RAILROADS

On May 17, 1946, in the face of a threatened strike of engineers and trainmen, President Truman seized the country's railroads. He asked the workers to remain on duty and directed the Office of Defense Transportation to operate the carriers.

In a radio address on May 24, the President delivered an ultimatum to striking railway trainmen and engineers to return to work by 4 p.m. the next day, otherwise he would place the railroads under military operation. He denounced the walk-out as a strike against the Government and declared that the challenge would be met at all costs. He appealed to the strikers to reject their union leadership and return to work to avert industrial collapse at home and starvation abroad. He announced that he would go before Congress the next day and call for restrictive legislation to prevent the railway or any other strike from imperiling the nation. The President laid the blame for the strike squarely upon the two union leaders, A. F. Whitney of the Trainmen, and Alvanley Johnson, of the Engineers.

REQUEST FOR LABOR LEGISLATION

Conformably with his previous announcement, President Truman addressed a joint session of the two Houses of Congress on May 25, 1946.

He asked for temporary legislation to take care of the immediate labor crisis and permanent legislation leading to the formulation of a long-range labor policy designed to prevent the recurrence of similar crises. The temporary legislation was to apply only to industries in which the President by proclamation declared that an emergency had arisen which affected the entire economy of the United States. It was to be effective only in situations where the President had taken over the operation of the industry. Severe penalties were provided against violators of the act, and the President was to be empowered to draft into the armed forces all workers who were on strike against the Government.

SEIZURE OF SOFT COAL MINES

On May 21, 1946, President Truman issued an executive order directing Secretary of the Interior Krug to take possession of the bituminous coal mines where there were interruptions or threatened interruptions in their operation as a result of strikes. When later in the year, the miners left the pits the President announced his intention of making a radio address on the subject. Speculation as to the trend of his remarks was ended when, on orders from John L. Lewis, the miners returned to work pending a decision of the Supreme Court, and the President canceled his radio appointment.

VETO OF CASE BILL

On June 11, 1946, President Truman vetoed the Case labor disputes bill. He condemned the bill as one that hit at symptoms and ignored underlying causes of industrial strife. He declared that it would not stop strikes and would force men to work under compulsion for private employers in a peacetime economy. The House of Representatives failed by five votes to override the veto. In his veto message the President asked that passage of permanent labor control legislation await a six months' study for a reorientation on basic causes of disputes.

EMERGENCY HOUSING PROGRAM

Submitting to Congress on Feb. 8, 1946 a report by Wilson Wyatt, Housing Expediter, of an emergency housing program for veterans, President Truman asked Congress for its prompt approval of the plan, which called for nearly 3,000,000 moderately priced and low-priced homes and apartments during the next two years. The President said the program had the complete and unqualified support of the Administration.

GOVERNMENTAL REORGANIZATION

Acting under the authority of the Reorganization Act of 1945, President Truman, on May 16, 1946, recommended a number of changes, among them the enlargement in the function of the Federal Security Agency and its eventual elevation to the status of an executive department whose head would join the Cabinet.

As to housing, the President recommended a permanent consolidation in the National Housing Agency of all principal governmental activities relating to that subject. Other proposals related to consolidations, eliminations, and transfers of various offices and agencies.

OPA VETO

In a strongly worded message to the House of Representatives, President Truman, on June 29, vetoed the bill to extend the Office of Price Administration. He declared that the bill was a choice between inflation with a statute and inflation without one, and that it continued the Government's responsibility to stabilize the economy and at the same time destroyed the Government's power to do so. He called upon Congress to act immediately on a bill to give America "adequate assurance of completing a successful transition to a sound peacetime economy." The President went over the bill in detail, singling out for special criticism a price-raising amendment by Senator Taft and amendments by Senators Wherry and Crawford which would benefit distributors and automobile and appliance dealers. President Truman repeated his criticisms of the bill in a radio address.

PRICE CONTROL AND TAX POLICY

On July 25, President Truman reluctantly signed the new Price Control Act but informed Congress that if it proved inadequate he would call a special session to strengthen it and perhaps raise taxes. In his message to Congress the President stated that, while the new law fell far short of being one with which his Administration could guarantee stable prices, it offered "a sufficient prospect of success to warrant the making of a wholehearted effort to keep our economy on an even keel until a flood of goods makes further controls unnecessary." He called upon consumers and businessmen to cooperate with the Government's efforts in the battle against inflation.

CONTROLS ON MEAT LIFTED

In a radio address bitterly criticizing opponents of price regulation, President Truman announced that on the following day, Tuesday, Oct. 15, price controls on meat would be lifted. He stated further that this could not be treated as an isolated transaction but that the program of lifting controls from other commodities, and also from wages, would have to be accelerated. In this way, the President said, we would move steadily toward a free economy and free collective bargaining.

DECONTROL STATEMENT

Convinced that the time had come when the general control over prices and wages no longer served a useful purpose as an instrument against inflation, President Truman issued a statement on Nov. 9 directing immediate abandonment of all control over wages and salaries and all controls over prices except that necessary to implement the rationing and allocation programs of sugar and rice. He declared that rent control, however, must and would be continued.

LIQUIDATION OF ECONOMIC RESTRAINTS

On Dec. 12 President Truman created by executive order a new Office of Temporary Controls to preside over the liquidation of remaining wartime economic restraints and direct the country's return to the free enterprise system. He appointed Major Gen. Philip B. Fleming, Federal Works Administrator, to be the head of the new agency. In setting up the new agency, the President abolished the Office of War Mobilization and Reconversion, the Office of Price Administration, Civil Production Administration, Office of Economic Stabilization, and National Wage Stabilization Board. Their few remaining functions were transferred to the new Office of Temporary Controls.

END OF CURBS ON HOUSING

In a sweeping statement issued on Dec. 14, President Truman opened home building to all citizens in a wide removal of restrictions. The problem of providing homes was turned over to private enterprise with virtually no restraints. The former $10,000 ceiling on the sales price for a new house was removed and priorities for obtaining scarce materials were scrapped. Prohibition of luxury-type housing, however, was continued through a system by which prospective builders must obtain a government permit.

CALL FOR HARMONY

Commenting on the Republican victory in the Congressional election, President Truman issued a statement on Nov. 11 in which he appealed for harmony in foreign and domestic policies and promised to "cooperate in every proper manner with members of the Congress" to attain that end.

PURGE OF DISLOYAL EMPLOYEES

By executive order issued on Nov. 25, President Truman created a new commission to determine standards for judging loyalty of the employees and applicants for Federal employment and to study ways and means of removing or disqualifying from employment any disloyal or subversive person. The commission was to be composed of one representative each of the Departments of Justice, State, Treasury, and War, and of the Civil Service Commission, with the Justice Department representative serving as chairman. After making a report by Feb. 1, 1947, the commission was to go out of existence.

CREATION OF CIVIL RIGHTS BOARD

The President issued an executive order on Dec. 5 creating a committee on civil rights to prepare a report making recommendations looking to the adoption or establishment by legislation or otherwise of more adequate and effective means and procedures for the protection of the civil rights of the people of the United States.

DRAFT-LAW VIOLATORS

On Dec. 23 the President named Owen J. Roberts as head of a three-member amnesty board to review the cases of 11,000 persons convicted of draft-law violations. He directed the board to examine the cases of all persons convicted under the Selective Service Act and to recommend those persons whom it deemed deserving of executive clemency.

LEND LEASE

In transmitting to Congress on Dec. 27 the twenty-third report on the operations authorized under the Lend Lease Act, the President stated that 70 per cent of our lend lease aid to the Allies was considered repaid and that the whole transaction should be regarded as "one of the foundations of economic stability in the post-war world." The report showed that agreements on final settlement had been concluded with the United Kingdom, France, Belgium, Turkey, Australia, New Zealand, and India. Still awaiting negotiation were settlements with the Soviet Union, China, Greece, The Netherlands, Norway, and the Union of South Africa.

PERIOD OF HOSTILITIES ENDED

At a news conference on Dec. 31, President Truman made public a proclamation declaring the period of hostilities ended at noon on that date, thus releasing part of the Government's extraordinary wartime powers. Besides wiping off the statute books immediately a number of emergency laws, his action set many others for an automatic end on June 30, or later, depending on the provisions of the particular laws. The President made it clear that he was not proclaiming the war ended, or the officially declared emergency over.

Among the powers ended at once was that of seizing privately owned plants and mines. In six months, unless Congress enacts new laws providing otherwise, the Government must turn back to private owners the coal mines it now holds. After June 30, a series of emergency taxes, including excise taxes on liquor, furs, jewelry, and other luxuries will drop to old rates. By acting before the close of 1946, the President reduced by one year the period of the Government's guaranteed price support program for farm products, since the law provides that the program should go on for two years beginning with the first day of January immediately after a proclamation ending hostilities.

APPOINTMENTS

On June 5, 1946, President Truman named Senator Warren R. Austin of Vermont as United States representative on the United Nations Security Council as successor to Edward R. Stettinius, Jr., who resigned.

On June 6, the President nominated Secretary of the Treasury Fred M. Vinson to be Chief Justice of the United States and John W. Snyder, the Reconversion Director, to be Secretary of the Treasury. At the same time the President elevated John L. Sullivan to the position of Under Secretary of the Navy.

The appointment of Oliver Max Gardner, Under Secretary of the Treasury, as Ambassador to the Court of St. James was announced by President Truman on Dec. 3.

NATIONAL PERSONALITIES

By Clark F. Norton
Professor, University of Michigan

JAMES F. BYRNES

During his 18 months as Secretary of State James F. Byrnes attended more diplomatic conferences of significance for future world peace than any of his predecessors. Following the 1945 conferences at Potsdam, London, and Moscow, Secretary Byrnes took an active part in the meetings during 1946 of the United Nations General Assembly at London (Jan. 10-24), the United Nations Security Council in New York (March 26-28), the Council of Foreign Ministers in Paris (April 25-May 15; June 15-July 12) and New York (Nov. 4-Dec. 11), and the Allied Nations Peace Conference in Paris (July 29-Oct. 16).

Matters pertaining to the control of atomic energy were of primary concern to Byrnes at the first session of the United Nations General Assembly in London. Before leaving Washington (Jan. 7) he appointed a special five-member committee to study the question and stated emphatically that final action on the disclosure of atomic secrets would require approval by the United States Government. A week later, after warning the General Assembly that nations must not fail to devise necessary safeguards insuring the use of atomic energy for "human welfare," he asked for the adoption of a resolution creating a United Nations Atomic Energy Commission. On the day (Jan. 24) he flew back to Washington, Byrnes told the Assembly that one of the first steps toward peace should be the conclusion of treaties with the nations that had been unwilling war partners of the Axis.

Late in January, the Secretary of State announced that the United Nations Atomic Energy Commission would be invited to watch the atomic bomb tests in the Pacific. In other statements Byrnes denied that the United States had sold machine guns to Spain, denounced political murders by the security police in Poland, and disclosed an agreement made at Yalta providing for Russian possession after the war of the southern half of Sakhalin and the Kuriles.

On February 1, Byrnes refuted reports of a rift between himself and the Chief Executive. He reaffirmed (Feb. 8) the "open door" policy for Chinese trade but belittled (Feb. 12) dispatches from Paris that this country would support Don Juan's aspirations to the Spanish throne. The proposed $3,750,000,000 loan to Great Britain, Byrnes maintained (Feb. 11), would bring "tangible, firm gains for the United States and the rest of the world." Among the measures before Congress which the Secretary of State favored were bills to provide an improved cultural relations and information service in the State Department, to establish a system of universal military training, and to extend the Selective Service Act beyond May 15.

A much sterner attitude toward the Soviet Union was indicated by the Secretary of State when he declared (Feb. 28) that no power had a right "to keep troops in the territories of other sovereign states without their approval" or "to help itself to alleged enemy properties in liberated or ex-satellite countries before a reparation settlement." Furthermore, he warned that the United States would not "stand aloof if force or the threat of force is used contrary to the purposes and principles of the (United Nations) Charter." In accordance with this new policy, he protested (March 5) the retention of Russian troops in Iran, supported (March 5) Chinese resistance to Russian demands in Manchuria, and rejected (March 11) Soviet charges that the United States had been interfering in Bulgaria contrary to the Moscow agreement.

At the United Nations Security

Council's first meeting in New York City (March 25), Byrnes read the welcoming address of President Truman, then represented the United States temporarily on the Council during discussion of the Iranian case where he defended (March 28) the right of a small nation to appear before the Council and press its complaint against a great power.

On April 23 Secretary Byrnes flew to Paris for a meeting of the Council of Foreign Ministers, where he proposed (April 25) that peace treaties be made immediately with Italy and Austria and asked (April 29) that a 25-year pact for the disarmament and demilitarization of Germany be adopted by the four occupying powers. Other ideas broached by him during the conference included a reduction in the number of occupation troops, a plebiscite over the Italian-Yugoslav frontier, and a peace conference of the 21 Allied nations to be held on June 15. After three weeks of disagreement on most of the basic issues, the Council at Byrnes' suggestion recessed (May 15) for one month.

Back in Washington, the Secretary of State threatened (May 20) in a nationwide broadcast that unless the Foreign Ministers agreed to call a peace conference during the summer, the United States would take the case to the United Nations General Assembly for action. A week later he denied (May 28) that there was an Anglo-American bloc trying to impose its will on the world. Further, he noted (May 29) that a primary aim of American foreign policy was the reduction of armaments in all countries to lowest levels commensurate with internal order and international peace.

When the Council of Foreign Ministers resumed deliberations in Paris on June 15, Byrnes succeeded, after a long struggle, in obtaining decisions to convene the peace conference in Paris on July 29 and to allow the conference liberty of action in adopting its own rules of organization and procedure. However, his efforts to adopt a disarmament treaty for Japan and to establish economic unity for Germany failed, except for an agreement with Great Britain looking toward economic consolidation of the British and United States occupation zones.

Reporting again to the American people by radio after the Council adjourned July 12, Secretary Byrnes said (July 15) good progress had been made toward peace with Italy and the satellite nations. However, he deplored Soviet opposition to the American plan for German disarmament and wondered whether the Russians realized the doubts and suspicions they had created in countries that wanted to be their friends.

Returning to Paris by plane on July 27, Secretary Byrnes attempted to placate dissatisfaction among smaller nations by telling (July 30) the delegates to the Peace Conference that the United States would back any recommendation made by a two-thirds vote of the conference, even if it were contrary to the peace treaties agreed to by the Council of Foreign Ministers. Accordingly, he supported (Aug. 5) a British proposal that peace treaty recommendations sent by the conference to the Council of Foreign Ministers should be of two kinds—one requiring a simple majority vote, the other a two-thirds vote—with the understanding that the latter would carry more weight in the Council's deliberations. At the insistence of Byrnes, the five enemy states with whom treaties were being considered were invited (Aug. 7) to attend plenary sessions of the conference.

Russian protests that Great Britain and the United States had formed an Anti-Soviet bloc were described (Aug. 9) by the Secretary of State as "loose and wicked talk." In resentment against the "repeated abuse and misrepresentation which have been leveled against America from this floor," Byrnes told (Aug. 15) the delegates that his nation had "no apology to make for the principles of justice, equality and freedom" which it advocated for the peace treaties. In turn, he criticized continued Russian domination of the economy in the Danube valley countries.

During a short visit to Germany, Byrnes, in a significant speech at

Stuttgart, outlined (Sept. 6) future United States policy toward that nation. In brief he set forth the following aims: economic unification of Germany without delay; establishment of central administrative agencies without regard to zonal barriers; shift "primary responsibility for the running of their own affairs" to the German people by setting up a provisional central government and eventually by democratically framing and adopting a constitution; reduction of occupation forces; and, except for the claims of Russia to Koenigsberg, France to the Saar, and possibly of Poland to Silesia and other areas, no "encroachment on territory which is indisputably German or any division of Germany which is not genuinely desired by the people concerned."

President Truman's firm stand in September, supporting the Secretary of State at the time of Secretary of Commerce Henry Wallace's attack on United States foreign policy, doubtless strengthened Byrnes' position in international affairs. While still in Paris, Byrnes agreed (Oct. 3) with a statement by Premier Stalin that the danger of war was remote, but, calling attention to the serious conflicts in opinion among the Allies, he expressed the hope that unwarranted charges that possession by the United States of the atomic bomb was a threat against the Soviet Union would cease. Discussions in Paris between the Italian Premier and Byrnes led to the announcement (Oct. 12) that the United States would pay Italy $50,000,000 as reimbursement for the lire supplied to American forces to purchase Italian supplies.

At the conclusion of the Paris Conference, Byrnes flew (Oct. 16) to Washington, where he told (Oct. 18) the nation by radio that, while the proposed treaties were "as good as we can hope to get by general agreement now or within any reasonable length of time," he was disturbed by the "continued if not increasing tension between us and the Soviet Union." However, he pledged that the United States would "continue to seek friendship with the Soviet Union and all other states on the basis of justice." Later, Byrnes voiced (Oct. 22) the opinion that United States' credits should not be granted to countries who believe we are trying to enslave them, and expressed (Oct. 25) his "hearty accord" with President Truman's proposal to open Palestine at once to substantial immigration of displaced Jews.

From Nov. 4 to Dec. 11 the Secretary was in almost constant attendance at the meeting in New York City of the Foreign Ministers Council. After the November Congressional elections, he assured (Nov. 11) the world that the Republican victory would not bring about a change in United States foreign policy. With British Foreign Secretary Bevin, he announced (Dec. 3) the economic unification on Jan. 1, 1947, of the British and United States occupation zones in Germany, and once more invited Russia and France to unify all four zones for economic purposes. Despite earlier controversy and delay, the Council made a number of important decisions before its session ended Dec. 11, including agreements on the signing of peace treaties in February for Italy, Rumania, Bulgaria, Hungary, and Finland, on a meeting of the Council in Moscow on March 10, and on the internationalization of Trieste.

Because of his "outstanding service to the American people" and his "efforts toward the attainment of a better, safer world," Secretary Byrnes was awarded (Dec. 3) a certificate of meritorious achievement by the Audubon Artists. *Time* magazine named (Jan. 6, 1947) Byrnes "man of the year" for 1946, describing him as the "firm and patient voice of the U. S. in the councils of the world." On Jan. 7, 1947, Byrnes announced his resignation because of health reasons, and was succeeded by General George C. Marshall, who assumed office Jan. 21, 1947.

BERNARD M. BARUCH

In 1946, Bernard M. Baruch at the age of 75 accepted an assignment as imposing as any he had undertaken during his long career—that of United States representative on the United Nations Atomic Energy Commission. After his nomination by President Truman to this post on March 18, Baruch gave assurances of his convictions that the Atomic Energy Commission could make recommendations but could not compel action by any nation, and that the United States representative thereon could act only according to instructions from the President. Early in April, his nomination was approved by the Senate Foreign Relations Committee and the Senate as a whole.

At the first meeting of the United Nations Atomic Energy Commission (New York City, June 14), Baruch proposed that exclusive control over the necessary raw materials and the production of atomic energy should be vested in an International Atomic Development Authority, established by a treaty under the auspices of the United Nations. Further, he suggested that signers of the treaty renounce use of the atomic bomb, that no veto exist on the action of the Authority, and that violators be considered international criminals and be severely punished. After an adequate system of control had been established, Baruch promised that the United States would stop manufacturing atomic bombs, dispose of any existing bombs, and disclose processing secrets to the Authority. He later recommended (June 28) that, when questions of punishment for atomic energy violations were being considered by the Security Council, the "Big Five" should give up their veto power.

Early in the fall, Baruch became involved in a controversy with the then Secretary of Commerce, Henry A. Wallace, who, in a letter (July 23) to President Truman and in public addresses, had criticized the United States atomic energy suggestions. Baruch claimed (Sept. 24) Wallace had admitted to him that he lacked full knowledge of the facts and had agreed to issue a statement to that effect, but that he had later refused to do so. This led Wallace to accuse (Oct. 3) Baruch of "increasing public confusion" and of trying to force him to give Baruch's atomic energy policies a "blank check endorsement."

This quarrel was renewed over another matter when the first issue (Dec. 16) of the *New Republic* edited by Wallace contained a statement that Baruch had helped fight the Government's case in the coal strike. Baruch branded this as "wholely false and deliberately so," but Wallace denied any responsibility for the article.

In the meantime Baruch refuted (Oct. 1) a charge that he had requested other nations to stop nuclear research and to reveal sources of uranium while the United States retained discretionary control over atomic energy matters. However, he asked (Oct. 9) why the United States should disarm alone. Following Soviet Foreign Minister Molotov's flat rejection of the United States program for atomic control, Baruch stated (Oct. 30) that the United States would accept the Russian plan for a treaty outlawing the atom bomb and would destroy its present stockpile if provision were made for full compulsion of obedience.

On Dec. 5 he once more pleaded with the Atomic Energy Commission to act quickly on his proposals. At the same time he opposed the British plan to couple prohibition of the atomic bomb with a ban on all weapons of mass destruction. Upon presenting (Dec. 17) a formal motion for the adoption of the United States recommendations, Baruch again stressed the urgency of the situation, saying that the "time has come to match our words with action." Opposition that arose over the veto issue led to the adoption (Dec. 20) of a Canadian compromise approving the principles of the American plan and instructing the working committee to submit a report by Dec. 31 based on those principles. A week later Baruch stated flatly that the United States would not take part in any plan to control atomic energy if the veto could be used to protect violators. Finally, on Dec. 30, the Commission approved a system of control almost identical with that originally proposed by Baruch.

Several opinions on national affairs other than atomic energy, voiced by Baruch in 1946, merit review. Declaring that the United States faced a major "political and philosophical issue—statism versus individualism," he claimed (Feb. 24) that the capitalistic system, while not perfect, was the best yet devised and should be repaired rather than torn down. Although he favored extending the Price Control Act, he testified (March 25) before a House committee that other essentials to national economic welfare were increased production, reduced government costs, stabilized money supply, high taxation levels, elimination of work stoppages, and establishment of a high court of commerce. Advancing the thesis that "Freedom can not die but death comes to those who abandon it," Baruch warned (Oct. 13) the nation against repudiating any portion of its freedom. When he presented the eighth annual award of *The Churchman* magazine to General Dwight D. Eisenhower, he stated (Dec. 3) that peace must come only through cooperation and not by appeasement.

In a surprise move on Jan. 4, 1947, Baruch resigned his post on the Atomic Energy Commission, explaining that his main job was done and that it would be better for the United States delegate on the Security Council to finish the task.

ARTHUR H. VANDENBERG

Again in 1946, Senator Arthur H. Vandenberg, whom Secretary of State Byrnes called (Oct. 18) "the spokesman for the Republican party in foreign affairs," devoted himself primarily to international relations. As a delegate to the United Nations General Assembly and as an adviser to Byrnes at two meetings of the Council of Foreign Ministers and at the Allied Nations Peace Conference, Vandenberg contributed materially toward the establishment of world peace.

At the outset of his departure for the London session of the General Assembly in January, Senator Vandenberg reaffirmed his faith in the ultimate authority of that body as "the town meeting of the world." His fears over the Moscow agreement were allayed (Jan. 8) by Secretary Byrnes' assurances that the United States would not disclose atomic energy secrets until effective international control had been established. While in London he served on the Assembly's administrative and budgetary affairs committee, predicted (Jan. 23) early adoption of a world free press resolution, and opposed (Feb. 7) using a large area for the UN homesite.

Returning to the Senate on Feb. 21, Vandenberg reported (Feb. 27) to his colleagues that, despite unavoidable controversy, he was amazed that, at the Assembly's first session, "the areas of agreement were so vast and significant" and the accomplishments were so great. In his opinion the United States and the Soviet Union could live together in harmony if we would match Russian candor and firmness and would "assume a moral leadership which we have too frequently allowed to lapse." Later, he advocated (March 15) continuous sessions of the Security Council to enable prompt handling of difficulties.

With regard to atomic energy control, the Michigan Senator defended (March 19) the so-called "Vandenberg amendment" (for a military liaison board to advise and consult with the proposed civilian atomic energy commission) against widespread protest that it would result in military domination. He insisted to the contrary that final decisions would be made by the civilian commission unless they were overruled by the President, but he agreed (April 2) to a modified version of the amendment. The United States offer to give up atomic bomb secrets under proper conditions was, he maintained (Aug. 14), a "display of international good will and good faith beyond any remote precedent or parallel in the annals of the human race." Bernard Baruch's efforts to eliminate the veto on questions involving punishment of atomic control violators received (Dec. 28) his unqualified endorsement.

Senator Vandenberg disapproved (March 26) Churchill's proposal for a British-American military alliance and demanded (April 3) that General Draja Mihailovich of Yugoslavia be given a fair trial. The proposed $3,750,000,000 loan to Great Britain was supported by him (April 22) in the belief that American foreign trade would suffer severely and a "desperate battle for economic survival" would ensue if it were not granted.

Each time Vandenberg returned from the two Paris meetings of the Foreign Ministers Council he summarized and evaluated their results in the Senate. The most significant feature of the first meeting he found (May 21) to be the emergence of "a positive, constructive, peace-seeking, bi-partisan foreign policy for the United States." At the second parley, the main difficulty he observed was (July 16) the "mutual distrust and suspicion, which the 'iron curtain' between us and the insatiable Soviet appetite for proselyting and propaganda do not help dispel." He asked Soviet leaders to understand that, while Americans deeply respected the Russian people and were willing to cooperate with all nations, we were determined to end military aggression and would not "bargain in human rights and fundamental liberties anywhere on earth."

On July 18, President Truman named Vandenberg one of five delegates to the UN General Assembly session in New York City. At Byrnes' request he flew to Paris (Aug. 24) to serve as an adviser at the Peace Conference. Following Wallace's attack on United States foreign policy, Vandenberg issued (Sept. 14) a statement in Paris pleading for bi-partisan support of Byrnes' policy and warning that "we can only cooperate with one Secretary of State at a time." During the conference, Vandenberg spoke (Oct. 10) for free navigation on the Danube River and appealed (Oct. 14) for a reduction of $100,000,000 in the amount of Finnish reparations.

After his return to the United States the Michigan Senator reported (Oct. 19) to the nation by radio that the "world's supreme peace conundrum" was how to attain common ground "between Eastern communism and Western democracy." Further, he blamed the Soviet Union for not fully reciprocating American efforts to establish a true peace. In his capacity as delegate to the General Assembly meeting in New York, Vandenberg argued (Nov. 1) against assessing the United States nearly one half of the administrative costs of the United Nations on the ground that it might endanger the "sovereign equality" of the other nations in the organization. The budgets of all United Nations agencies, he urged (Nov. 12), should be brought under centralized control.

Senatorial duties and political affairs occupied much of Vandenberg's attention during the intervals between international conferences. Issues he voted for in the Senate included the $100,000,000 grant for school lunch purposes, a 60¢ an hour minimum wage in place of the proposed 65¢ rate, the emergency housing bill, the "Taft amendment" to the price control extension bill, and the proposed equal-rights-for-women constitutional amendment. On the other hand, he denounced (May 29) the labor-draft provisions of the President's emergency labor disputes bill as unnecessary, impractical, an invasion of personal liberties, and detrimental to Army morale. Although he supported extension of the selective service system, he insisted (June 5) that no man should be drafted unless the volunteering system produced a deficit. He suggested also (June 11) experimenting with price regulations by decontrolling one key industry as a "clinical demonstration."

Following his November re-election by a large majority for a fourth term, Senator Vandenberg was designated President *pro tempore* of the Senate and chairman of the Foreign Relations Committee for the 80th Congress, but he relinquished the chairmanship of the Republican Conference. On Dec. 17 he announced that, while he would willingly serve the administration in matters of foreign affairs if needed, he expected in the future to devote himself mainly to the Senate. When asked regarding his aspirations for the presidency, he declared: "I am not a candidate for the Presidential nomination."

MRS. FRANKLIN D. ROOSEVELT

In 1946, Mrs. Franklin D. Roosevelt, widow of the President, became one of the few women in American history to hold a major post in American foreign relations. As a delegate to the United Nations General Assembly meetings in London and New York, she contributed substantially to the deliberations and actions of that body. Moreover, through her newspaper column, extensive travels, and numerous addresses, she continued as in former years to command nationwide attention and respect.

At the London session of the General Assembly, Mrs. Roosevelt was named (Jan. 7) United States representative on the social, humanitarian and cultural committee, and she was instrumental in presenting an appeal to the General Assembly for a larger participation of women in its activities. To eliminate the language barrier between nations, she urged (Jan. 26) that children all over the world should be taught one internationally understood language as well as their own native tongue. She debated (Feb. 13) successfully against a Russian proposal to prohibit the distribution of "propaganda" against members of the United Nations in refugee camps.

After a two-day visit to Germany (Feb. 13-15), where she inspected displaced persons camps, toured Berlin, and advised American soldiers abroad against hasty marriages to European women, Mrs. Roosevelt flew back to the United States. In a series of addresses and interviews following her return, she made these observations: that the leadership so badly needed by Continental nations should be supplied by American youth (Feb. 19, 25); that, if we are to avoid another destructive war, the United States must help solve world problems by extending aid abroad and doing all possible to establish collective security (March 14); that our first objective must be to make the United Nations an organization belonging to the people (March 14); that chaos in Europe could not be averted by material aid alone (March 21); and that we could better understand Russia if we would recall the attitude of our forefathers on international affairs during the early history of our republic (April 5). One year after the death of President Roosevelt, she formally turned over (April 13) the family estate to the Federal Government for development as a national shrine.

At its first meeting in the United States, Mrs. Roosevelt was elected (April 29) by acclamation chairman of the Human Rights Commission of the United Nations Economic and Social Council. President Truman appointed her (July 18) to be one of the five United States delegates to the United Nations General Assembly meeting in New York beginning in September, then named her on Nov. 6 to serve a four-year term on the Human Rights Commission.

Several times Mrs. Roosevelt spoke out in the interest of harmony between the United States and the Soviet Union. Although she admitted that Russian tactics did not always please her, she insisted (May 30) that we must learn to get along with the Soviet. People who fear Russia forget that the United States is the most powerful nation in the world, she asserted (Oct. 8).

Nevertheless, Mrs. Roosevelt herself clashed in debate with Soviet delegates at various United Nations meetings, especially over the proposed constitution of the International Refugee Organization. Speaking (Nov. 8) to the General Assembly's social, humanitarian, and cultural committee, of which she was a member, and later addressing (Dec. 14) the entire General Assembly, Mrs. Roosevelt disputed Russia's contention that the IRO should not aid or resettle refugees who refused to return to their native lands. Likewise she challenged the Soviet delegate's use of the word democracy as "synonymous with Soviet" and the implication that nations not conforming to Russian ideas were "fascist."

Only a few of the large number of domestic issues on which Mrs. Roosevelt took a definite stand can be mentioned here. She opposed (June 1) the proposed equal-rights-for-women amendment to the United States Constitution, defended (Sept. 27) profits made by shipbuilders during the war, and criticized (Nov. 19) John L. Lewis' actions in the coal strike. As a keynoter of the New York State Democratic Convention, she declared (Sept. 2) that, while the Democratic party adhered to progressive ideas, the Republicans looked backwards and tended to block liberal reforms. After the convention she actively campaigned in the interests of her party candidates in the state election.

THOMAS E. DEWEY

Thomas E. Dewey's record as Governor of New York, his prominent place in the Republican party, and his overwhelming victory in a bitter contest for reelection, made him again in 1946 a leading national figure.

Indicative of Governor Dewey's policy were the following recommendations appearing (Jan. 9) in his annual message to the New York legislature: a large reduction in state taxes; state rent control legislation; pay increases for state employees; a billion dollar public works program; increased state aid for housing, education, and municipalities; and a bipartisan committee to study the advisability of a bonus for war veterans. Through several special messages, he later outlined in detail several features of his program, such as a $35,000,000 appropriation for emergency housing, streamlining of state welfare operations, the creation of a special commission to survey the need for a state university, a greatly enlarged public health system, and more rigid traffic safety controls.

Of the 1,327 bills passed by the New York legislature in 1946, Governor Dewey signed 1,002 and vetoed 325. Among the more important acts he approved were bills which reduced the state personal income tax 50 per cent, increased to 80 per cent the state's contribution for municipal relief costs, provided additional state funds for slum clearance and low-cost housing, established state rent control in case Federal regulation should end, authorized New York City to raise additional funds by new taxes, and provided additional educational, housing, and transportation facilities for veterans attending colleges.

Governor Dewey's interest in promoting education during 1946, characterized by his dramatic assertion (Jan. 11) that "civilization is a race between education and catastrophe," deserves special comment. Calling to Albany the heads of 85 New York State colleges and universities to consider emergency means of coping with enlarged school enrollments, the Governor told them (March 7) that a way had to be found to provide higher education for 75,000 or more veterans. From this meeting arose the joint sponsorship by the educational institutions and the state government of three new, temporary, two-year colleges, established on the sites of former army and navy bases. In the fall, Governor Dewey formally opened and dedicated all three of these new institutions: Champlain College at Plattsburg (Sept. 23), Mohawk College near Utica (Oct. 16), and Sampson College near Geneva (Oct. 23). In addition, Dewey approved (June 11) an emergency allocation for extra facilities at 11 established state colleges and universities, ordered (Oct. 10) a special survey of school finances to determine whether salary schedules needed revision, and denounced (Oct. 17) racial and religious bias in the admission of students to colleges and universities.

Temporary housing was another problem with which Dewey was greatly concerned in 1946. More than 30 emergency housing projects, providing over 7,500 dwelling units, received his approval. Several times he condemned Federal authorities for delaying the state housing program by withholding priorities for essential materials. Confronted in October with a "sit-down siege" of the Senate chamber at Albany by a group of veterans seeking funds for more housing, Dewey rejected (Oct. 20) a demand that he call a special legislative session for that purpose on the grounds that the state had already appropriated more money for housing than could be used in 1946 because of the limited available supplies.

On various occasions during the year Dewey made significant statements pertaining to foreign affairs. In his welcome to the United Nations, he assured the delegates (March 25) that both major political parties in the United States supported the "coalition for peace." Policies he advocated included admitting the new Italian Republic as a full partner to the United Nations (June 11), adopting a covenant to establish freedom of information and press throughout the world (Sept. 14), and immediate, large-scale immigration of Jews into Palestine (Oct. 7).

For three months before his renomination on Sept. 4 by the Republican State Convention, Governor Dewey set forth in frequent speeches throughout the state some of the ideas on which his formal campaign was later based. Predominant in these talks was the theme that the election would be primarily a contest between Republican concepts of true American liberty and freedom and Democratic beliefs in a controlled and regimented society. Time and again he asserted the need for economic and social freedom, for maximum opportunity for the individual, for equal rights of labor and business alike. As might be expected, he frequently reviewed the accomplishments of his administration, citing such points as the accumulation of a $500,000,000 surplus despite large tax and debt reductions and increased state aid for education, health, welfare, and other services. Other claims Dewey made were that, during his governorship, New York had the best record of any state in the Union for peaceful labor-management relations and that more progressive legislation had been adopted than during any prior 20-year period.

In his post-nomination campaign, Dewey relied mainly on his past record and made few promises for future action. The American Labor and Liberal parties' coalition with the Democrats and the policies of the national administration were frequent targets for his criticisms. Accusations by his opponent, Senator James M. Mead, that the state surplus fund was being used as a "political slush-fund" and that construction of a cross-state super-highway would delay home building were ridiculed (Oct. 15, 25) by the Governor. His closing declaration to the voters was that they must choose between "honesty and misrepresentation," between "inevitable confusion" and "sober, responsible, good government working in teamwork."

Dewey's upstate strength at the polls was so great that, despite his loss of New York City by nearly 200,000 votes, he won the election by more than 675,000 ballots, the third largest majority in New York history. After a three-week vacation with his family in Georgia, Governor Dewey attended (Dec. 2) a meeting at Miami of the executive committee of the National Conference of Governors. Shortly after returning to Albany he announced (Dec. 11) the likelihood of no increase in state taxes during 1947, although the budget would be substantially larger. As a result of a conference with Republican members of Congress from his state, the Governor reported (Dec. 18) that Charles A. Halleck of Indiana would be supported by the New York Congressmen for House majority leader. This evoked (Dec. 20) a demand by another candidate for the post, Representative Thomas Jenkins of Ohio, that presidential candidates should not interfere with the choice of House leaders. In the meantime, when Governor Dewey was asked if he was ready to announce his candidacy for President, he replied (Dec. 16), "Certainly not."

HENRY A. WALLACE

After more than nine years in the Cabinet and four years as Vice President, Henry A. Wallace left government service in September. As Secretary of Commerce during the first nine months of the year, Wallace advocated the following measures directly concerned with the nation's economic welfare: adoption by Congress of an "economic charter" pledging governmental action to assure equal opportunity for earning a living; establishment of machinery to coordinate the various governmental plans and functions affecting full production and full employment; approval of the St. Lawrence Waterway project; increased wages and salaries for "white collar" workers; broadening of the Social Security Act to give universal coverage to all population groups; Federal aid to promote the industrialization of undeveloped areas in the United States; and the maintenance of price controls.

In the June issue of the *American Magazine,* Wallace outlined various ways in which government could help avoid depressions by extending special services to small businesses. However, he complained (June 27) that adverse publicity had concealed the real progress made toward industrial conversion. At Mexico City, Wallace declared (Sept. 3) that the United States favored industrialization of the industrially backward nations. For labor, he asked (Dec. 26) a cost-of-living bonus coupled, if possible, with a guaranteed minimum annual wage.

In foreign affairs the Secretary of Commerce recommended (Feb. 8, May 27) the proposed British loan, but he disliked (April 28) what he termed Great Britain's policy of exploitation and interference in Palestine. The system of using secret agents to gather military information he denounced as "hellish." As in past years, he favored (July 25) expanding United States trade with Latin-America.

Wallace's outspoken criticism of United States foreign policy, especially as it pertained to the Soviet Union, led directly to his dismissal from the Cabinet. As early as March he had opposed a sterner attitude on our part toward Russia, and again in April he said there was no reason to fear war with Russia. In his major speech on Sept. 12, which President Truman said he had read and approved, Wallace opposed "get tough with Russia" tactics, demanded recognition of Russian domination in the affairs of Eastern Europe, and warned the United States not to bind its foreign policy to that of Great Britain. Since these ideas were contrary to Secretary of State Byrnes' policy, the President tried to quell talk that it constituted an official repudiation of Byrnes by stating (Sept. 14) that he had intended to approve only the right of Wallace to deliver the speech and not the speech itself.

Nevertheless, Wallace released for publication a letter he had written President Truman nearly two months earlier which maintained that our Russian policy was aggressive, dangerous, and should be modified. After a long conference at the White House, Wallace announced (Sept. 18) that he had promised to make no public statements or speeches until sessions of the Paris Peace Conference had ended, but only two days later the President asked him to resign from the Cabinet. In a brief radio speech Wallace then asserted that "winning the peace is more important than high public office" and that he intended "to carry on the fight for peace."

Wallace also was much concerned about the proper approach to the atomic energy control problem. He condemned (March 12) the "Vandenberg amendment" as a potential step toward "military fascism," and he claimed that if Congress passed a reactionary bill, "France will surely surpass us in the peacetime development of atomic energy." If we were to prevent atomic energy from destroying mankind, he declared (July 31), there must be a "profound change in the moral values and the thinking habits of the people the world over." Stemming from his letter of July 23 to the President, in which he criticized the United States atomic energy control plan, there ensued in September and October a rather bitter controversy between Wallace and Bernard Baruch.

Interest in Wallace's position in the Democratic Party was heightened by numerous statements he made during the year on political action and party politics. Claiming that the Democratic Party had flourished only when fighting for progressive measures, he predicted (Feb. 8) that when it ceased to be "the people's party" it would fittingly die. While he believed that there was need for political action independent of political parties, Wallace was very critical on several occasions of party members who broke the party line in voting on fundamental issues in Congress. Such members, he suggested, should be denied committee appointments and be deprived of patronage. Representatives and Senators from both parties immediately condemned this proposal, but Wallace said (April 10) it meant only "self-discipline" rather than a "purge" in party ranks, and he continued to attack the "recalcitrant minority" and "dissident members" of the Democratic Party. It was his opinion that the formation of a third party would only divide the ranks of progressives and assure their defeat, although he believed that the Democratic Party had lost some of its zest and needed a "rebirth."

When it was announced (Oct. 12) that he would edit the *New Republic,* Wallace said he would do what he could to arouse people to the "need of stopping this dangerous armament race."

HERBERT C. HOOVER

In the hope of helping to prevent world famine, former President Herbert C. Hoover returned to public service briefly in 1946. Appointed (March 1) honorary chairman of a new Famine Emergency Committee by President Truman, Hoover immediately appealed to the American people for a sizable reduction in their consumption and wastage of foodstuffs.

During a globe-circling flight the ex-President and his staff visited (March 17-May 10) most of the European and Asiatic nations to investigate food conditions and to discuss relief measures with governmental leaders. Before departing Hoover dramatically asked in a nationwide broadcast each American family to "take to your table an invisible guest" from a starving country. While in Paris, he stated (March 21) his opposition to a resumption of rationing in the United States because it would not be effective in time to meet the crisis. In France, Italy, and North Africa he found conditions to be "difficult but not intolerable," but he reported from Warsaw (March 30) that the plight of Poland was the worst seen by the mission in Europe.

Upon reaching London Hoover proposed (April 5) the establishment of a new and more effective international organization than UNRRA to mobilize the world's food resources. Great Britain he refused to classify as a "hungry country," while Belgium, Holland, and Denmark he considered to be in comparatively good shape. To avert widespread starvation in Greece, he suggested (April 17) the immediate diversion of 100,000 tons of cereals then en route from Canada to the United Kingdom.

After Hoover completed his inspection of Europe, President Truman asked him to report to the nation in person the facts about food. Instead he spoke (April 19) to the American people by radio from Cairo, grimly describing the desperate straits of most European countries, then continued his famine inspection travels to Asia. Immediate relief for India's stricken areas must come, he said (April 26), from Australia, Burma, Iraq, Java, and Siam, but the Philippine food problem could be easily solved, he suggested (April 29), by an exchange of surplus military vehicles for the rice of Siam and Indo-China. After visits to China, Korea, and Japan, Hoover declared (May 6) in Tokyo that famine conditions in the Far East could be substantially alleviated if Russia would release "part of the foodstuffs which it has secured in Manchuria."

On his arrival at San Francisco

(May 10), Hoover warned that if the coal strike continued and if the threatened railroad and shipping stoppages materialized "it will mean death to millions." In his report to President Truman he expressed (May 13) confidence that by "further vigorous conservation" and with better cooperation the supplies needed to prevent mass starvation could be obtained. Again he called upon Americans through a nationwide broadcast (May 17) for increased self-denial to help "dispel the hunger which hangs over the homes of more than 800,000 people."

At an emergency conference in Washington of the United Nations Food and Agricultural Organization, Hoover once more advocated (May 26) establishing a new international food agency to absorb by September all food activities of UNRRA. Because of its wastefulness and inefficiency, he opposed continuation of charitable distribution of food.

From May 25 to June 19 Hoover made a 15,000-mile air tour of 11 Latin-American countries to seek aid in combatting famine. While in Rio de Janeiro, he charged (June 15) that Communists in all countries were trying to "break down the provision of food for hungry people and thus produce chaos where they can fish in troubled waters." On his return he reported that the "excellent cooperation" of the Latin-American countries would result in large additional food exports. By June 28, the ex-President was able to declare categorically at Ottawa, Canada, that the "tragic gap" in minimum food supplies had been closed. However, as chairman of the Greek War Relief Association, he requested late in the year (Dec. 17) contributions of surplus food to relieve suffering in Greece.

Important pronouncements on other matters of national political interest were made in 1946 by Hoover. Claiming that the dominant issue facing the United States was "free men against the tide of Statism," he called upon the Republican Party (Feb. 12) to give the people an opportunity to choose freedom instead of the "world-wide reaction today toward economic serfdom."

ROBERT A. TAFT

Ohio's Senator Robert A. Taft, chairman of the Senate Republican Steering Committee, gained nationwide recognition in 1946 as a top-ranking leader of his party. The first of Taft's many attacks on the Administration during the year came Jan. 4, when he condemned President Truman's legislative program as superficial, ill-considered, and not acceptable to the public. His basic political philosophy was set forth in speeches at Kansas City (Feb. 12) and Dallas (Feb. 14), where he said that government must return to the principles of liberty, justice, and equality under the law, that delegation of unlimited discretionary authority to the President must cease, and that Federal power must be reduced and all possible control be left in the hands of the state and local governments.

Notwithstanding Senator Taft's primary concern with internal problems, some of his opinions on foreign relations are worth noting. In place of the proposed $3,750,000,000 loan to Great Britain, he suggested (April 24) an outright gift of $1,250,000,000. Criticizing the "disastrous effects" on wood producers of the reciprocal trade-agreement policy, he favored (July 29) a protective tariff for any industry "capable of producing two-thirds of domestic needs." He denounced (June 6, July 30) British refusal to admit 100,000 Jews to Palestine and the proposed partition of that nation into separate Arab and Jewish states. Because he believed that fundamental principles of law were violated by the death sentences imposed at Nuremberg on 11 Nazi war leaders, Taft deplored (Oct. 5) them as a "blot on the American record that we shall long regret."

As ranking minority member on the Senate Education and Labor Committee, Taft was very active in labor legislation. Fearing that the proposed minimum wage of 65¢ an hour would cause inflation and unemployment, he urged (March 21) adoption of a 55¢ an hour rate instead. The solution to the strike problem, he believed, was "to redress somewhat the excessive power given to labor unions in collective bargaining." Accordingly, he introduced (May 25) a series of amendments to the Case labor disputes bill designed to establish fact-finding commissions for public utilities, insure union responsibility on contracts, prohibit secondary boycotts, exempt supervisory employees from the National Labor Relations Act, prevent labor union "racketeering," and increase the power of the courts in labor disputes.

In Taft's opinion, President Truman's requested emergency labor legislation violated (May 25) "every principle of American jurisprudence"; he particularly objected (May 29) to the section authorizing the induction of strikers into the army. In the debate over the bill for the return of the USES to the states, Taft opposed (June 24) retention by the Federal Government of supervisory powers over state employment systems.

In line with his belief that the National Government had a responsibility to insure that "every family has a minimum standard of decent shelter," Senator Taft introduced (April 11), jointly with Senators Wagner and Ellender, a measure proving a long-range program to encourage private homebuilding and subsidize low-rent public housing projects. Despite his opposition to the feature of the Emergency Housing bill guaranteeing a market for pre-fabricated houses, he voted (April 10) for the bill on final passage.

Taft was a main participant in the Senate battle on subsidies and price control. He opposed (Feb. 27) continuation of subsidy payments on food and disputed (April 16) with OPA Director Bowles their inflationary effects. He advocated (June 11) continuing price and rent controls for a year, but gradual decontrolling of certain items to avoid rapid price increases; however, he insisted that identical standards be applied for the decontrol of agricultural and non-agricultural commodities. The Senate adopted (June 12) Taft's amendment to provide a production incentive by fixing manufacturers' prices at the level received in October, 1941, plus the average increase in costs in the industry making the product. He regarded (June 30) President Truman's veto of the price control bill, in which the President condemned the Taft amendment, as somewhat of a personal attack on him. Although he disapproved (July 12) a resolution to continue OPA without change for one year, he voted (July 24) for the substitute price control measure which was enacted into law.

In the fall, Senator Taft served (Sept. 11) as keynoter at the Ohio State Republican Convention and, not up for reelection himself, he delivered several important political addresses in support of other Republican candidates. After some hesitancy Taft decided in December to retain the headship of the Republican Steering Committee in the 80th Congress and to seek the chairmanship of the Labor Committee rather than that of the Finance Committee, either of which he would have been entitled to by seniority.

HAROLD E. STASSEN

Former Minnesota Governor Harold E. Stassen maintained a prominent place in national politics during 1946 by pursuing an extensive speaking schedule, by sponsoring the Republican Open Forums, and by announcing his candidacy in December for the 1948 Republican presidential nomination.

In a series of addresses during the early months of the year, Stassen set forth many of his ideas on national government and world affairs. Some of the more significant domestic policies he advocated were: a long-range, large-scale, Federal housing program; the elimination of unfair discrimination in employment; relatively high taxes during times of prosperity; a cooling-off period and fact-finding committees for labor disputes; no limitation on collective bargaining or the right to strike; and a general change in the price structure.

In the international field Stassen urged the United States to shape its foreign policy along the following lines: complete fulfillment of our United Nations commitments; unceasing efforts for an international police force, joint disarmament, and atomic energy control; acceptance of a trusteeship over captured Pacific islands; abandonment of unilateral action on international affairs; extension of large loans to England, France, Greece, and Russia; and formation of no alliances against other nations. For the United Nations, Stassen proposed (Jan. 18, 23) the establishment of an atomic air force for world police duty and the assumption of jurisdiction over disputes in Iran, Java, and Greece.

In declining to run for United States Senator, Stassen explained (March 14) that he wanted freedom to discuss public issues with people in all states and to learn first hand about the problems of other nations. On March 29, he announced the creation of the Republican Open Forums, with himself chairman of the advisory committee. These were to be channels through which party members could express their opinions on broad national and international questions to help formulate party policy.

In the spring Stassen continued to make numerous public appearances throughout the country. Racial and religious bigotry he attacked (April 5) as a menace to the freedom of every individual. He advised (April 12) the Republican Party to be "forthright, constructive, progressive, and dynamic." Features of the labor policy he advocated were provisions for extensive negotiations before strikes could occur, democratic control of and financial accountability for labor unions, and the settlement of jurisdictional disputes by a special tribunal. Because of their major responsibility for the slowness of national reconversion, he demanded (May 21) the removal from office of Commerce Secretary Wallace, Labor Secretary Schwellenbach, and Stabilization Director Bowles. At San Francisco, Stassen voiced a plea (May 29) for developing a concept of the "right to work" along with that of the "right to strike."

As keynoter at the Connecticut Republican State Convention, Stassen condemned (Sept. 9) both the domestic and foreign policies of the Administration. For worldwide control of atomic energy, he proposed (Sept. 10) that the United Nations appoint an outstanding board of scientists vested with inspection and supervisory powers not subject to the veto of any nation.

As early as Sept. 14 the Minnesota Republican Convention endorsed Stassen unanimously for President in 1948. On Nov. 15, Stassen admitted approving the issuance of a pamphlet proposing him for the presidency, but not until Dec. 17 did he formally announce his candidacy. Simultaneously, he said that his aim was "to move the Republican party along the path of true liberalism," especially in regard to labor laws.

THE YEAR IN CONGRESS

By Mary Sumner Benson
Assistant Professor, Milwaukee-Downer College

ORGANIZATION AND COMPOSITION

The second session of the Seventy-Ninth Congress convened on Jan. 14, 1946. There were 57 Democrats, 38 Republicans, and one Progressive in the Senate. In the House, 243 Democrats, 190 Republicans, one Progressive and one American-Laborite continued substantially the balance of the first session. The officers were those of the first session, Senator

Kenneth McKellar (Tenn.) as president pro tempore of the Senate and Sam Rayburn (Tex.) as Speaker of the House. The majority leader of the Senate was Senator Alben W. Barkley (Ky.). Serving as majority and minority leaders of the House were John W. McCormack (Mass.) and Joseph W. Martin, Jr. (Mass.).

GENERAL

Before Congress convened, President Truman made a radio address to the people in which he urged them to encourage their representatives to act speedily on a number of bills. In his combined State of the Union and Budget Message sent to Congress on Jan. 21, 1946 he stressed immediate action on five emergency measures, price control extension, Second War Powers extension, continuation of food subsidies beyond June 30, 1946, emergency and permanent housing legislation, and extension of the Selective Service Act beyond May 15, 1946. He also listed 21 other measures on which he thought action desirable. When Congress adjourned in August, approximately eight of these had been enacted into law but not all in the manner desired by the President. Many Administration measures were opposed by a coalition of southern Democrats and Republicans. The Case labor union bill and the first measure extending the Office of Price Administration were vetoed by President Truman, and several other acts were signed "reluctantly." It was generally considered that the year was not one of presidential and congressional cooperation in the field of domestic affairs. There was greater unanimity in foreign affairs.

COURSE OF LEGISLATION

Legislation moved slowly in the first part of 1946. Action in the Senate was delayed for three weeks by the filibuster against the Fair Employment Practices Committee. Committee work went on intensively in both houses. The House recessed from April 18 till April 30. The Senate continued in session to consider the loan to Great Britain. At this time, members desired adjournment by mid-July in order to campaign for the November elections. The next three months were of intense pressure. Strikes in April and May emphasized the need for labor legislation. The Selective Service Act was continued by a stop-gap measure only a few hours before its expiration on May 15. The Price Control Act reached the President only to be vetoed shortly before the expiration of the previous act. Several of the 1946-1947 appropriation acts were not completed before June 30, and in one or two instances payments for the new fiscal year were delayed. Important measures on which action was completed in the closing weeks of the session were the bill for domestic control of atomic energy, the loan to Great Britain, the Congressional reorganization bill and the modified price control measure.

The Congressional Reorganization Act, signed by President Truman on the last day of the session, was regarded as a long delayed and most promising reform which should expedite activities greatly in future Congresses.

Congress adjourned on Aug. 2, marking the first time in several years that sessions had not continued into December. The November elections showed that the incoming Congress would be of a different political cast.

AIRPORTS

A government program to increase the country's airports by 3,000 during the next seven years was undertaken. Federal expenditures of $500,000,000 between July 1, 1946 and July 1, 1952 were authorized, to help any state, municipality, or other local government agency desirous of building an airport and able to provide a share of the money. The Federal funds will be allocated among the states according to a formula based on population and area and will be handled by the Civil Aeronautics Administration.

APPOINTMENTS

Among the most controversial appointments of the year was that of Edwin C. Pauley to be Under-Secretary of the Navy. This was the subject of extended hearings before the Senate Naval Affairs Committee. There was much inquiry into Pauley's earlier connection with the oil industry, as well as the matter of contributions to the 1944 campaign fund by the oil industry and the matter of a Federal Government suit for title to offshore tideland oil in California. Secretary of the Interior Ickes opposed the confirmation of Pauley and openly disagreed with President Truman on the matter. The President's defense of Pauley led to the resignation of Secretary Ickes, effective Feb 15, 1946. A considerable number of witnesses gave testimony, which continued for some weeks. It finally became clear that a majority of the committee would not report favorably on the appointment. President Truman on March 13 withdrew the nomination at the request of Pauley, who stated that he believed he had completely answered the charges made, but he felt that under the circumstances he would not have the opportunity to render the Navy or the President the services they deserved. Subsequently John L. Sullivan was appointed to the post and confirmed by the Senate.

George E. Allen was confirmed by a voice vote for a two-year term on the board of directors of the Reconstruction Finance Corporation after an attempt on the floor of the Senate to send the nomination back to the committee for further study.

After the resignation of Chester Bowles as Price Administrator, Paul A. Porter of the Federal Communications Commission was unanimously approved for the post.

In June, Fred M. Vinson was nominated as Chief Justice of the United States. He was succeeded as Secretary of the Treasury by John W Snyder, who was confirmed without objection. The Senate confirmed Vinson as Chief Justice nine days later by a voice vote. Other notable appointments included Julius A. Krug as Secretary of the Interior, James E Webb as Director of the Budget, and Lieut. General Walter Bedell Smith as Ambassador to Russia. John R. Steelman was confirmed in June as Director of the Office of War Mobilization and Reconversion. Lieut. General E. B. Gregory became War Assets Administrator. W. Averell Harriman was named Ambassador to Great Britain.

Two new names were added to the list of United States representatives in the United Nations—John J. Winant as United States member of the Economic and Social Council and Senator Warren R. Austin who replaced Edward R. Stettinius on the Security Council.

APPROPRIATIONS

In his budget message at the beginning of the year, President Truman suggested expenditures of approximately $36,000,000,000 for 1946-1947. In a review of the budget issued as Congress adjourned he estimated the figure at $41,500,000,000 despite decreases of approximately $2,000,000,000 in some fields. Most of the increase was attributed to legislation passed during the session, of which major items were terminal leave pay, increased pay for military personnel, increased pensions and benefits for veterans, housing, pay increases in the Post-Office Department, funds for Philippine war damage and a loan to the Philippine Republic.

An act passed in February 1946 rescinded $51,786,811,921 in wartime appropriations and contractual obligations. This measure had been vetoed in December, 1945 because of the clause returning the U. S. Employment Service to the states. It was passed in substantially the same form without this clause. Another recession act in May nullified an additional $6,286,000,000 worth of war appropriations. Deficiency measures of more than $4,500,000,000 were passed during the year. A supplemental bill passed on the last day of the session appropriated an additional $2,636,289,000. This was primarily to cover the sums authorized in the provisions for terminal leave pay.

Some of the principal appropriation acts passed were:

Agriculture Department	$1,137,694,189
Interior Department	247,167,000
Labor Department and Federal Security Agency	1,155,015,670
Naval Appropriation	4,119,659,300
War Department and Military Establishment	7,263,542,400
War Department Civilian Appropriation	300,000,000*
Coast Guard	116,226,000
Independent Offices and Executive Office	5,000,000,000*
Legislative Branch	54,000,000*
Treasury and Post-Office	1,500,000,000*

* Approximate.

Nearly $2,000,000,000 was authorized in a Rivers and Harbors measure and a Flood Control bill, but the appropriations were to be made at a later date.

ARMED FORCES

A number of questions concerning the armed forces of the country arose during 1946. Among these was demobilization. In January, a special Senate Military Affairs Sub-committee undertook investigation of the whole problem. This followed demands for the reduction of our occupation forces and for immediate discharge of fathers. General Eisenhower gave an extended report to the committee on the Army's plans for demobilization. The subcommittee report favored acceleration of demobilization and made several specific suggestions to that end, asking that they be reviewed by the full committee in conference with General Eisenhower and others.

The matter of the draft was attacked on March 17, when a House group asked that a special joint Senate-House committee consider the size of armed forces needed for occupation commitments, voluntary enlistments, and the continuance of the draft. The President had asked that the draft be extended beyond the May 15 expiration date. Hearings were conducted by the Senate and House Military Affairs Committees separately, however. Testimony in favor of extension was given at committee hearings by Secretary of State Byrnes, Secretary of War Patterson, Secretary of the Navy Forrestal, General Eisenhower, and other prominent military leaders. General Eisenhower suggested indefinite continuation of the draft in the age-brackets of 18 to 26 years and limiting of service to 18 months. Secretary Forrestal felt that if the Selective Service Act were continued the Navy could obtain the numbers needed through its voluntary enlistment program but not otherwise. Secretary Byrnes stressed the need for continuance in the light of the international situation. Later Secretary Patterson indicated that the Administration would be satisfied with a one-year extension.

There were extended hearings and discussions and many suggestions of compromise were made. The measure as passed by the House extended the Selective Service Act for nine months from May 15, but forbade any inductions under the extended act until Oct. 15. Military pay was also increased. Eighteen and 19-year olds were exempted, as were fathers. The Senate framed a stiffer bill, but on May 9 passed a resolution extending the act as it stood for six weeks as a stop-gap. The House made changes in this also. On May 14, four hours before the expiration of the act, the President reluctantly signed a measure extending selective service to July 1 but banning the induction of fathers and of youths 18 and 19 years old.

Most of the Administration disapproved the bill but preferred it to the end of the draft. At the same time, the President appealed to Congress to pass a measure for a year's extension before July 1, in a form which would meet the nation's requirements. On June 5 the Senate sent to the House a measure extending the draft to May 15, 1947 and restoring the authority to conscript 18- and 19-year-olds. This went to conference with the House measure. Various difficulties occurred in the conference. On June 25 a bill was sent to President Truman which extended selective service to March 31, 1947 and excused 18-year-olds and fathers from conscription. Men from 19 to 44 were subject to induction. The size of the Army was fixed at 1,550,000 on July 1, 1946 and 1,070,000 a year later. Men might be discharged after 18 months of service, and service of new inductees was limited to that term. A companion bill provided service pay increases from 50 per cent for privates to ten per cent for the highest officers.

Continued from the previous session were discussions of plans for the unification of the Army and Navy. This had been strongly advocated by President Truman in 1945. A bill calling for a "Department of Common Defense," proposed by the Senate Military Affairs Committee in April, contained elaborate plans for a merger in accordance with the President's wishes. The measure was opposed by Secretary Forrestal before the Senate Naval Affairs Committee as placing too much power in the hands of a single individual. This opposition was shared by the heads of the Senate and House Naval Committees. In June, President Truman sent them a letter indicating the 12 basic principles on which the Army and Navy Departments were in agreement and urging speedy legislative action embodying these principles. No action, however, was completed before adjournment.

The size and strength of the Navy proved a debatable issue. Fleet Admiral Nimitz, Secretary Forrestal, and other officials of the Navy Department urged an increase of the enlisted personnel from 300,000 to 500,000 and an increase in commissioned personnel to 40,000. The President asked a budget of $3,725,000,000, to be increased to $4,225,000,000 by transfer from the Naval Central Procurement Fund. This would have been the Navy's largest peacetime budget. The Navy itself feared that this would be inadequate for the 500,000 enlisted men and 1,079 ships desired. The House finally passed a measure providing $4,139,718,000 in addition to the sum to be transferred. This apparently gave the Navy larger sums for research and public works but tied up some ships in the inactive reserve fleet. After some changes in the Senate, $4,119,659,300 was approved. In the appropriations "cut-backs" bill, signed in February 1946, $6,000,000 was made available for rebuilding Guam, a project to be carried out by the Navy.

The President asked $7,246,335,200 military appropriations for the War Department for the fiscal year 1946-1947. This was somewhat reduced by the House Appropriations Committee, but the fund for atomic energy was nearly doubled. When finally signed, the bill appropriated $7,263,542,400 and included funds for military relief and government in occupied countries.

On May 6 the President submitted to Congress a bill authorizing a program of military collaboration with other American countries, including the training, organization, and equipment of the armed forces of those countries. No action was completed.

Despite strong urging on the part of the Administration nothing was done about universal military training.

President Truman signed a bill authorizing the country to "stockpile" strategic and critical materials. He objected strongly to the "Buy American" provision of the act but felt that the national interest required that the Government have power to acquire "stockpiles" now.

The President vetoed a measure which provided for promotion of Navy, Marine Corps, and Coast Guard personnel who were prisoners of war, with retroactive increases of pay and allowances.

Minor bills passed included one for admission of fiancees of American servicemen regardless of immigration quota limitations. Some controversy arose over the bombing tests held by the Navy at Bikini and designed to test the efficacy of the atomic bomb. Questions were raised as to the international effect of the timing of the tests and the dangers of revealing the secret of the bomb. The measure was finally passed.

ATOMIC ENERGY

The discussions on national control of atomic energy begun in the first session of Congress continued throughout the 1946 session. After extended hearings, debates, and conference work a measure was sent to the President on July 26 and signed Aug. 1. Much of the discussion had centered about the matter of civilian or military control. The measure as passed created a five-man civilian control commission to exercise government monopoly over fissionable materials. Just below the control commission is a military liaison committee which is to be informed of every decision taken or contemplated by the commission. This committee has the right to appeal to the President against any action believed adverse to military security. In these cases, the President has the final word.

The bill creates a general manager and four technical divisions to work with the commission. The Government is given a virtual monopoly on inventions and patents in the atomic energy field. The civilian commission supervises the production of atomic weapons and has exclusive control over fissionable material used in the assembling of bombs. The director of the division of military application of atomic energy is to be a military man. The Army and Navy with the President's approval may assemble their own atomic weapons with material released to them by the commission. The commission has broad domestic powers but is forbidden to distribute fissionable materials to any foreign government or to any person for a use not under the jurisdiction of the United States. The death penalty may be exacted for dealing in the weapon or in its secrets with intent to injure the United States. The commission also has power to condemn private property essential to its purposes and to control patents on processes used in connection with fissionable material. The measure was regarded as one of exceptionally far reaching governmental control but one justified by the problems raised by atomic force.

CONGRESSIONAL AND ADMINISTRATIVE REORGANIZATION

"Streamlining" Congress had long been a matter of discussion. In 1945 a special joint Senate-House group of 12 members with Senator La Follette (Wis.) as chairman and Representative Monroney (Okla.) as vice-chairman was named to study the problem. After a year's study a report was made in March with 37 recommendations for change in organization and procedures, especially in committees. Committee consolidation, staffs of specialist experts, greater oversight of administrative agencies, and reorganization of the appropriations system were especially urged. The matter was vigorously debated in each house, and measures differing in various ways were passed. On July 26 the Senate accepted the House bill, which was enthusiastically signed by the President. The act increased Congressional salaries to $12,500 a year and added a $2,500 expense account not subject to income tax. It was provided that members of Congress over 62 years of age might retire on pension after six years of service by contributing to the Civil Service Retirement Fund. The number of committees was cut from 33 to 15 in the Senate and from 48 to 19 in the House, and it was provided that representatives should each serve on only one committee, senators on two.

Congressional lobbyists were required to register names, employers, and expenses. Closer Congressional control of finances was sought by provision for the drafting of a legislative budget early in each session by joint meetings of the appropriations committees of each house—the House Ways and Means Committee and the Senate Finance Committee. If estimated outlay went beyond expected receipts there would have to be an increase of the debt limit or an overall cut in appropriations. There was no enforcement provision for the legislative budget. Various minor provisions were designed chiefly to improve or expedite committee procedures.

Under authority of the Reorganization Act of 1945, President Truman recommended three governmental reorganization proposals. The one centralizing welfare activities in the

Federal Security Agency as a preliminary step to making it a new cabinet post and the one transferring a number of functions from one agency to another were accepted by the Senate although rejected by the House Acceptance by one house was sufficient to put the plans into effect. The remaining proposal, which would have unified all Federal housing activities in one agency, was defeated.

Salaries of Federal judges were increased by a flat raise of $5,000 a year

The State Department was authorized to reorganize the Foreign Service. Salaries of all career workers were increased. Those of ambassadors were raised from $17,500 to $25,000 Provision was made for establishment of a foreign service institute to serve as a post-graduate training school for foreign service officers. New standards for promotion were introduced, and the office of director general of the foreign service was created. Foreign service officers were required to spend at least three of their first 15 years of work in the United States and to take home leaves every two years while serving abroad.

The office of Under-Secretary of State for Economic Affairs was established. This was designed to be a two-year post to dispose of unusual post-war problems. After that, the position was to revert to that of Assistant Secretary.

An Administrative Procedure Act was the result of ten years of study and was endorsed by the American Bar Association. It provided for the dissemination of information concerning the organization and procedure of government agencies, gave detailed requirements for administrative hearings, and simplified judicial review of agency decisions.

Congress approved the continuance of the Reconstruction Finance Corporation to June 30, 1947.

DEBT LIMIT

Measures changing the debt limit were not new. In 1946, however, the public debt limit was reduced from $300,000,000,000 to $275.000.000,000 with the endorsement of the Treasury Department. This was hailed as marking the end of deficit financing.

THE LOAN TO GREAT BRITAIN

Perhaps the most important problem in legislation relating to foreign affairs, in both time spent in study and interest aroused, was the loan to Great Britain. President Truman sent a special message to Congress favoring the project on Jan. 30, 1946 and signed the bill approving the loan on July 15. Among those giving extended testimony in favor of the loan were Fred M. Vinson, then Secretary of the Treasury, Secretary Byrnes and William Clayton of the State Department, Secretary of Commerce Wallace, Winthrop Aldrich of the Chase National Bank and International Chamber of Commerce, and Eric Johnston, then president of the United States Chamber of Commerce. Principal opponents before the Senate Banking Committee were Hamilton Fish and "General" Jacob S. Coxey. There was a vigorous month-long fight on the Senate floor, but the measure was approved 46 to 34 on May 10. The House approved it on July 13 by a vote of 219 to 155. The loan extended $3,750,000,000 to Great Britain in the form of a credit which may be drawn on during a five-year period at an interest rate of 2 per cent. Britain in return agreed to abolish any exchange controls relating to United States exports to the United Kingdom, to abolish the "dollar pool," and to eliminate "sterling bloc" preferences.

On March 1 the President transmitted to Congress a report of the National Advisory Council on International Monetary and Financial Problems which not only endorsed the loan to Britain but declared that the British case was unique and would not constitute a precedent for other loans. The operations of the Export-Import Bank were explained and Congress was urged to increase the lending authority of the Bank by $1,250,000,000.

OTHER FOREIGN AFFAIRS

Both houses approved United States membership in the United Nations

Educational, Scientific and Cultural Organization. The House of Representatives passed the measure by a roll call vote of 264 to 41. A law was passed authorizing the State Department to use up to $20,000,000, derived from the sale of surplus property abroad, for a student exchange program and other educational activities with foreign countries.

On the last day of the session the Senate voted 60 to 2 to accept compulsory jurisdiction by the World Court for disputes among nations over treaties, international law, reparations, and breaches of international obligations. An amendment to the original measure provided that the final determination of whether disputes affecting the United States were international or domestic in character would be left to the United States. It was also voted that disputes arising under a multilateral treaty would not come under the International Court unless all parties to the treaty were also parties to the case before the Court or the United States specifically agreed to the jurisdiction where this Government was concerned.

Measures dealing with the Philippines might be regarded as either foreign or domestic, since the islands were recognized as independent on July 4. A trade bill gave the Philippines a preferential market in the United States for 28 years with the first eight years free of duty and the next 20 years with a gradual imposition of tariff. The bill also provided that United States citizens have equal property rights in the Philippines. A rehabilitation bill authorizing $520,000,000 for the Philippines and the transfer of $100,000,000 in surplus property was also passed. Later a $75,000,000 loan for the new republic was authorized, with a provision that interest be at least 2 per cent.

Despite presidential requests, funds for military assistance to China were not voted. A law was passed authorizing the transfer of 271 surplus small naval vessels to China by sale, lease, trade, or outright gift.

The Senate ratified a treaty on regulation of inter-American traffic which provided for reciprocal treatment of signatories as to registration and drivers' licenses. The Senate also ratified the treaty establishing the International Civil Aviation Organization. This made the United States the tenth official signatory. Twenty-six signatories are required to establish the organization on a permanent basis. The organization will administer internationally accepted rules for commercial flying, such as pilot certification.

Both houses manifested much concern for foreign affairs. The House received in February a long report on post-war economic policy and planning from its special committee under the chairmanship of Representative Colmer (Miss.). The report summarized economic conditions in each European country and was notable for its report of alleged Soviet control in eastern Europe. A subcommittee of the House Foreign Affairs Committee also reported on a trip to Europe and presented a detailed analysis of observations in Russia. In June the President sent Congress reports on lend-lease operations from March 11, 1941 to Dec. 31, 1945. This twenty-second report showed $49,096,000,000 in total aid between these dates. Conclusion of final settlements with several countries was also announced.

HOUSING

Little was accomplished in the way of long-range housing plans. On March 28 President Truman signed a measure authorizing the appropriation of $250,000,000 to provide at least 100,000 temporary housing units for war veterans and their families. This was the second of such temporary provisions, another having been included in the final deficiency bill of the previous session. It called for remodelling barracks and temporary wartime housing and for moving temporary housing no longer needed in industrial centers to college towns to meet shortages caused by enrollment of veterans under the G. I. Bill of Rights.

The Administration had requested an emergency housing bill designed to produce 2,700,000 new homes in two years. Payments of $600,000,000 in production premiums and authority to put price ceilings on existing buildings were asked as part of this program. Congress rejected both these requests. The Patman bill as finally passed provided $400,000,000 to encourage production of scarce materials, increased by $1,000,000,000 the Government's authority to insure home mortgage loans, continued priorities and allocation authority to Dec. 31, 1947, gave preference to veterans in purchase or rental of new homes, permitted price ceilings on new houses, and gave broad authority to the Housing Expediter in issuing orders to other government agencies and controlling the export of lumber.

President Truman's reorganization plan for unifying all Federal housing activities in one agency was not accepted. Much interest was shown in the Wagner-Ellender-Taft long-range housing bill, which was passed by the Senate. Action on it was not completed in the House despite special presidential urging late in July. After adjournment there was some popular demand for a special session to complete action on the bill, but nothing came of it. The bill would have merged 16 bureaus dealing with housing problems into a National Housing Agency, helped to finance public low-rent housing projects in cities by a Federal contribution not to exceed $88,000,000 annually, made loans on land development for slum clearance, aided rural home building, and assisted prospective home buyers by more liberal insurance provisions. It involved a ten-year plan.

INVESTIGATIONS

Investigations into many phases of national activity were pursued extensively by regular and special committees. The work of the Joint Committee on Pearl Harbor and of the Senate Special National Defense Investigating Committee is noted under separate headings.

The House Committee on Un-American Activities, made a standing committee in 1945, went into many problems. In May 1946, the House showed its confidence in the group by voting it an additional appropriation of $75,000 for its work by a vote of 240 to 81. The funds were not voted without vigorous discussion. A report issued in June dealt chiefly with the Joint Anti-Fascist Refugee Committee of New York and the Communist movement and criticized sharply one phase of the War Department's indoctrination course for American soldiers. In October further hearings were held on Communistic activity. Much publicity was given to a meeting at which Chairman Rankin was the only committee member present in which he differed sharply with Dr. Harlow Shapley of Harvard on the method of procedure.

The House Committee on Campaign Expenditures was active throughout the fall. It conducted an inquiry into the work of the CIO Political Action Committee and the National Citizens' Political Action Committee and held hearings on American Action, Inc. of Chicago. No final report on this was issued. As the year ended, the committee was recommending that the new Congress continue an inquiry into the re-election of Representative Vito Marcantonio of New York.

The Senate Campaign Expenditures Committee was also active. In October it dismissed charges of excessive spending and other irregularities in the renomination of Senator Kenneth McKellar (Tenn.) on the ground that they were not supported. Perhaps the committee's most spectacular investigation was that into the re-election of Senator Theodore G. Bilbo of Mississippi and the charges that Negroes were prevented from voting in the election. No final report was issued before the close of 1946. The committee also investigated the senatorial elections in Maryland.

Of interest among the many war construction and contract investigations was the report of the House Roads Committee that the Alcan Highway had been constructed as economically as could be expected and that there was no evidence of irregularity.

LABOR

The strikes and other labor restlessness of the post-war period raised the problem of legislation in this field. President Truman especially favored the passage of a bill authorizing the establishment of fact-finding groups in industrial disputes which would prevent strikes during the period of the fact-finding process. Congress in general was inclined to stronger action. A strike control bill (Case bill) was brought up in the House early in the session. The measure was reported by the Rules Committee rather than the Labor Committee and was hotly debated. It was generally regarded as a substitute for the fact-finding bill favored by President Truman. The bill passed the House 258 to 155 on Feb. 7, 1946. It provided for mediation, voluntary arbitration, civil suits for breach of contract and Federal court orders to enjoin violent picketing and enforce cooling-off periods. Amendments proposed in the Senate Labor Committee would have rendered the measure far less stringent. Then came the coal strike. The Senate hastily called the bill up and a series of amendments to strengthen the bill were proposed from the floor.

The coming of the railroad strike led President Truman to propose an emergency strike control bill but the Senate first voted 49 to 29 for its stronger version of the Case bill. The measure included as a whole the Hobbs Anti-Racketeering bill passed earlier by the House. The House approved the measure with the Senate amendments four days later 230 to 106. It was vetoed by the President, whose veto was sustained in the House. President Truman stated that the bill would tend to increase rather than decrease strikes and was otherwise objectionable. He recommended that a joint committee be appointed to study the entire problem for six months.

On May 25, the President had suggested an emergency strike control bill which would have given him power to draft strikers into industries taken over by the Government and to transfer all profits of strike-bound plants under government control to the Treasury Department. The House voted the measure within two hours of its introduction by a vote of 306 to 13. This was to be a temporary measure. In the Senate it was stripped of the essential labor draft and otherwise weakened. No final action was taken. The provisions of the Hobbs Anti-Racketeering bill, passed by the House in December, 1945 had been included in the vetoed Case bill. Then in June, after the veto, the measure as a whole was brought up and speedily passed by the Senate. The bill made it a felony under Federal law to interfere by "robbery or extortion" or by threats of violence with the movement of goods in interstate commerce. Heavy penalties were provided for violation. The President signed it on July 3 with a statement that the act did not deny to unions their rights in carrying out their legitimate objectives.

A measure, later called into question before the courts, was the "Petrillo" bill. This prohibited "coercive practices" interfering with the broadcast of records and transcriptions, or with purely educational and cultural programs, or with programs originating outside the United States. It also forbade coercion to require radio stations to employ in broadcasting persons in excess of the number the station needed.

Attached to the Agriculture Department appropriation bill was a provision forbidding payment of salary to any worker belonging to an organization which claimed the right to strike against the Government. Another rider to the appropriation for the Department of Labor and the Federal Security Agency provided that standards for agricultural workers should be those defined in the Fair Labor Standards Act rather than the Social Security Act. Workers protested that this withdrew nearly 1,000,000 agricultural workers from the protection of the National Labor Relations Law. President Truman hesitated somewhat over signing the act, but did so on July 26. This created a delay in the issuance of the first half month's pay check to employees by these agencies.

"Full Employment" had been much discussed during 1945. The Senate and House had passed different measures before adjournment. A compromise bill, the Employment bill of 1946, was signed in February. It provided a council of three economic advisers to the President to assist in the preparation of periodic economic reports to Congress. These reports and others were to be studied by a Joint Committee on the Economic Report composed of seven members from each house who would then devise ways of implementing the recommendations.

Proposals for a permanent Fair Employment Practices Commission were among business left over from 1945. The FEPC was brought up in the Senate on Jan. 17, 1946. This resulted in a filibuster conducted chiefly by southern Democrats. Attempts to invoke closure were not successful. and the FEPC bill was removed from its place as unfinished business on Feb. 9 and was not taken up again.

In December 1945 President Truman had vetoed a bill cutting back $50,000,000,000 of appropriations because it contained a clause calling for return of the United States Employment Service to the states within 100 days. This led to a separate measure dealing with the USES. The House passed a bill ordering its return by June 30, 1946. The Senate voted its return by Dec. 31, 1946. In a final compromise the office was voted returned to the states in November.

SOCIAL SECURITY

Various proposals were made for changes in the Social Security Act. There was general agreement on the provision freezing the Social Security payroll tax at one per cent for 1947. Other phases of the measure were more controversial, but a compromise bill was worked out by Senate and House conferees on Aug. 1 and approved the following day by both houses. It provided bonus social security payments to all states alike of $5 a month for each aged or blind person on the state rolls and $3 for each dependent child. There had been an effort to make proportionally larger grants to the poorer states. The bill also doubled Federal expenditures for maternal and child welfare and took maritime workers into the unemployment compensation system.

Railroad workers were given larger old-age insurance benefits. The number of workers covered by the act was extended. Survivor, disability, and sickness benefits were added to the original act.

Proposals by the Administration to increase the legal minimum wage to 65 cents an hour in 1946 and 70 cents by 1950 were brought up in the Senate. The measure was tied to one increasing farm parity prices by including all farm labor costs in the computation of such prices on major agricultural commodities. The President warned the Senate that he would veto the bill with such a provision. Nevertheless the Senate passed the bill by a voice vote. It was not acted on by the House.

Pay of over 1,000,000 civil service employees of the Federal Government was increased by 14 per cent or $250, whichever was greater. There were some exceptions to the general rule. No salaries covered by the act were to exceed $10,000 a year, and persons in the lower brackets might have a maximum increase of 25 per cent. The bill provided that 75 per cent of the increase must be absorbed by a reduction in personnel.

In the closing week of the session the President recommended to the consideration of Congress the proposals of the International Labor Office for the establishment of minimum working and living conditions in non-self-governing territories.

OIL TIDELANDS

The problem of title to oil tidelands arose in Congressional hearings early in the year. On July 22 the Senate voted 44 to 34 to give the states clear title to oil-rich tidelands extending three miles or more into the ocean.

The measure was opposed by Majority Leader Barkley. According to the Senate Judiciary Committee, U. S. Supreme Court decisions had upheld the rights of the states over such lands but measures introduced in Congress and claims by the Department of the Interior had cast doubt on them. The Interior and Justice Departments opposed the measure partly because a suit to determine title to such lands was before the Supreme Court. The House agreed to the bill, which was vetoed by President Truman on Aug. 1. He alleged that Congress had invaded the jurisdiction of the Supreme Court and that the matter should be left to judicial decision. The House voted to sustain the President's veto.

PEARL HARBOR

The inquiry into the Pearl Harbor disaster by a special Congressional investigating committee, begun on Nov. 15, 1945, had been extended to Feb. 15, 1946 before the first session of Congress adjourned. Hearings continued between sessions and after the convening of Congress. Admiral Harold R. Stark, Rear Admiral Husband E. Kimmel, and Major General Walter C. Short were questioned at length. Copies of a report to the late President Roosevelt by Frank Knox, former Secretary of the Navy, were introduced. Former Supreme Court Justice Owen J. Roberts stated that the version of this report issued by President Roosevelt was complete. Many other witnesses were called. The chief point of interest was the supposed "winds" message. The testimony left it uncertain whether there was such a meassage and if so what its significance may have been.

On Feb. 15 the life of the committee was extended to June 1 with the understanding that formal hearings end on Feb. 20. At the time that these hearings closed it was estimated that the record amounted to 15,000 pages in addition to documents. The personal memorandum of former Secretary of War Henry L. Stimson was given to the committee. Questions submitted to Stimson and to former Secretary of State Cordell Hull were answered in writing. Hearings were resumed by the committee in April. On May 23 the records were formally closed but were reopened briefly on May 31. At that time a new deadline, July 10, was set for the report.

The report was finally made public on July 20. The committee found by a majority of eight to two that President Roosevelt was blameless for the disaster. It asserted that the greatest responsibility lay with the Army and Navy commanders in Hawaii but that their failures were errors of judgment, not derelictions of duty. The War and Navy Departments were described as "not sufficiently alerted." The ultimate responsibility was placed upon Japan for her unprovoked act of aggression. The report recommended the unification of command at all outposts and the complete integration of Army and Navy intelligence agencies. It also gave a long list of supervisory and administrative principles for the consideration of the War and Navy Departments.

A report filed by the minority of two dissented from most of the majority points and placed the chief responsibility on eight men—President Roosevelt, Secretary of War Stimson, Secretary of the Navy Knox, General Marshall, Chief of Staff, and several others.

These reports were believed to mark the end of inquiry into the subject.

PRICE CONTROL

Price control was a much debated subject. The Office of Price Administration and the Civilian Production Administration received much criticism from some of the witnesses who appeared before various committees. In March, the House Special Committee on Post-War Economic Policy and Planning recommended, though with reluctance, that the program, somewhat liberalized, be continued till June 30, 1947. This recommendation was included with others, such as maintenance of Federal income tax rates, curtailment of Federal expenditures and continuance of control over consumer credit, as anti-inflationary measures.

Bernard Baruch, appearing before the House Banking and Currency Committee, urged continuation of OPA for a year. The House in late April amended the proposed Price Control Extension Act so far that members of the Administration described the bill as virtually repealing price control. The measure, which gave a nine months' extension in a modified form, was passed by a vote of 355 to 42, despite protest by a large number of organizations which viewed the act as inflationary. Testimony urging the continuance of positive controls was given before the Senate Banking and Currency Committee by the National Grange, the American Farm Bureau, and the National Farmers' Union, although they differed on retention of subsidies. Lumber and dairy producers urged the lessening of controls, as did cotton manufacturers. President Truman announced that he would veto the bill in the form passed by the House and urged a stronger bill on the Senate. After two months the Senate Banking and Currency Committee reported out a measure viewed by the Administration with even greater disfavor than the House version. This was passed on June 13 with additional amendments from the floor and the House and Senate measures were sent to conference. A compromise bill passed the House on June 25 and the Senate on June 28. The old law was to expire at midnight June 30.

The compromise bill, opposed both by those who wished no control at all and by those who wanted stronger controls, would have extended the OPA for one year, but shifted authority over prices of farm products to the Secretary of Agriculture. It would have created a "decontrol" board with authority to overrule refusals by the price administrator or Secretary of Agriculture of requests to remove ceilings. Price ceilings on any product would be based on the 1941 price plus increased production costs since that time. Consumer food subsidies were limited to $869,000,000 and, except for sugar, were scheduled to end on May 1, 1947. The bill contained a number of other modifications. Chester Bowles resigned as Stabilization Director immediately after the passage of the bill and urged the President to veto it, as it made effective control of prices and rents impossible. Senator Barkley, majority leader, and others wished the President to sign it to prevent the end of all control. On June 29 President Truman vetoed the bill and appealed to the public by radio to influence Congress to retain the controls and prevent inflation. The House sustained the veto.

The President contended that the vetoed measure would have proved inflationary in its effect through price increases and uncertainties, higher wage demands and higher production costs. He suggested extension of the law for a year, the continuance of food subsidies to avoid serious price increases and to permit orderly termination of subsidies, and plans for the removal of most price controls and subsidies during the coming year.

The country was thus left temporarily without price control. The House passed a temporary resolution on July 1 extending price control to July 20, presumably while an extension act was being prepared. The Senate, however, did not concur in this action but began work on another compromise bill, to which many amendments were proposed. This was offered as a substitute for the House resolution and the two measures were sent to conference. The resultant bill was passed by both houses and was signed by the President on July 25. He repeated that the measure fell short of his hope but signed it as the best likely to be passed and as a better bill than the one vetoed June 29.

The bill extended OPA till June 30, 1947 and restored rent and price ceilings and other orders in effect June 30, except for ceilings on meat, poultry, eggs, dairy products, grain and feed, soybeans, cottonseed, petroleum and its products, and tobacco and its products. Livestock, milk, cotton, and soybeans would be subject to controls after Aug. 20 unless the decontrol board exempted them beyond that date. It created a three-man decontrol board with extensive powers of decontrol and under some conditions recontrol which would assume much of OPA's former authority. The OPA was required to raise many ceilings within 60 days. The act established a new formula under which ceilings on many manufactured goods must be increased. Ceilings were to reflect 1940 average industry-wide prices on each product, plus cost increases which had occurred since that time. Ceilings were to be lifted from any item whose current supply equalled demand, and non-essential commodities were to be decontrolled by Dec. 31. On July 27 the President named, as members of the Decontrol Board, Roy L. Thompson, Daniel W. Bell, and George Mead. The Senate confirmed the appointments without debate two days later.

SILVER

The price of government-owned silver caused a deadlock between the two houses for a time. A measure was finally passed permitting the sale of silver to industry at 90.5 cents an ounce. The Treasury was also authorized to purchase silver at this price if the silver had been mined within a year of the time that it was offered for sale.

VETERANS

Congress displayed great interest in the welfare of veterans. It was estimated that over $10,000,000,000, or nearly one-third of all appropriations for the fiscal year 1946-1947, went to veterans' services or programs; $7,393,966,415 was appropriated for the Veterans Administration; $2,431,708,000 more was designated for terminal leave payments to enlisted men. Programs for relief of the veterans' housing shortage accounted for $328,784,000. There were some other appropriations for construction of veterans' hospitals and building material subsidies.

In May, President Truman signed the Veterans Priority Bill. This gave honorably discharged service men second claim after the Federal Government on surplus property and first claim on a special group of items to be set aside by the War Assets Administration.

War service insurance provisions for GI's and veterans were liberalized to permit lump sum payments, restrictions on the naming of beneficiaries were removed, total disability coverage was added, and a flexible system of conversion from military to civilian type insurance was introduced.

A law amending existing statutes gave American citizenship to children born overseas to American soldiers and foreign wives provided the American parent had lived in the United States for five years after his twelfth birthday.

A bill was passed in July providing additional temporary facilities for colleges with unprecedented enrollments. The act authorized the Federal Works Administration to take over surplus war structures and facilities and to transport and convert them into educational facilities for institutions furnishing courses to veterans; $75,000,000 was provided for this purpose in the third deficiency bill.

A 20 per cent increase in pension and compensation payments was granted to veterans of both world wars and their dependents. Full compensation was authorized for six months for veterans who are receiving hospital treatment or institutional care through the Veterans Administration. Increases were granted to certain groups of disabled Spanish-American war veterans, and an increase was made in the rate of pensions of members of the Regular Army, Navy, Marine Corps, and Coast Guard who become disabled through other than war service.

Terminal leave pay for veterans proved a somewhat complex problem. The House passed a bill providing for cash payment. In the Senate Military Affairs Committee it was voted to make the payments largely in five-year interest-bearing government bonds, in order to avoid inflationary effects. The American Legion, the Veterans of Foreign Wars of the United States, and the Disabled American Veterans approved the payment by bond. The Senate voted the measure with this provision, and the bill was sent to conference. It was agreed that payment would be made largely in bonds which would be negotiable for use as premium payments on government life insurance or national life insurance or in converting one to the other or in payment of a policy loan on such insurance made prior to July 31, 1946. The bonds would draw interest at 2½ per cent and collect face value at maturity. Payment was to be on the basis of accrued unused leave at the rate of two and one half days for each month of active service after Sept. 8, 1939 at the rate of pay on discharge plus subsistence allowances. Payments were to be made in cash when the amount due was less than $50 and in certain other instances. The bond plan applied to officers, who had previously been paid in cash.

Terminal leave pay for enlisted men was new. President Truman asked that $2,679,493,000 be appropriated as terminal leave pay for enlisted service men and women discharged before Sept. 1, 1946. The final deficiency bill of the session included $2,413,000,000 for this purpose. It was estimated that 15,000,000 veterans would be entitled to benefits. The same deficiency appropriation included $30,000,000 for the purchase of specially equipped automobiles for veteran amputees. This would provide equipment for some 20,000 disabled veterans at a cost not to exceed $1,600 each.

WAR INVESTIGATING COMMITTEE

The Special Senate Committee Investigating National Defense, popularly known as the Mead and later as the Kilgore Committee, was very active. Early in the year it probed the disposal of war surpluses. In a report issued March 22, 1946 the committee criticized the "dilatory policies" of the Army and Navy in making surpluses available overseas and the failure of the State Department to create better conditions abroad for such sales. It was suggested that future sales of surplus armaments to other countries be made subject to Congressional authorization. The report was especially critical of the terms of transfer of surplus military property to Great Britain. In August the committee called for additional reports to Congress on the sale of surplus property abroad.

War contracts were also a special subject of study. Long hearings were held on the Garsson munitions combine which was alleged to have profiteered. Questions were raised about defective mortar shells which caused casualties among the users. A War Department report later cleared the firm on this point. Study was also made of the connection of Representative Andrew J. May (Ky.), chairman of the House Military Affairs Committee, with the Garsson contracts. Controller-General Lindsay C. Warren in testimony before the committee attacked the War Department's procedure with war contractors. President Truman issued an executive order permitting the committee to examine income, excess profits, and other tax returns in order to facilitate its work. The committee also examined Representative John M. Coffee (Wash.) as to a payment received in 1941 which he stated was a campaign contribution but which was alleged to have been payment for services rendered in connection with war contracts.

The committee probed also into the Canol project, the oil developand pipeline in Canada and the Yukon. Members were insistent on access to Army and Navy documents on the subject. President Truman finally "declassified" the files, making them available to the committee. The committee had attacked the project as a waste persisted in by the Joint Chiefs of Staff despite protests by the Secretary of the Navy, the Budget Director, and the committee itself. It was explained, although not in detail before the committee, that the project was kept up for reasons of strategy, not procurement. The committee also studied the reasons for the construction of the Inter-American highway.

Many of these studies went on after Congress had adjourned. As the year ended, the committee was conducting a detailed investigation into the alleged relations of Senator Theodore G. Bilbo (Miss.) with war contractors. This dealt primarily with "campaign contributions" in 1942. Investigators were sent to Mississippi. The early hearings were held in executive session. Public hearings began in Washington on Dec. 12. About 30 witnesses were summoned. The meetings of the subcommittee which heard testimony were marked by some disturbance and acrimony. Senator Bilbo himself took the stand. Another prominent witness was Edward P. Terry, former private secretary to Bilbo. On December 31 the War Investigating Committee made its report. This charged that Senator Bilbo had received gifts, services and political contributions in return for his aid to certain war contractors and that by these transactions he had "misused his high office and violated certain Federal Statutes." The report was signed by two Democrats and four Republicans. One Democratic member of the committee disapproved the report and two others refrained from signing it on the ground that they had heard little of the testimony. The report led to a movement to keep Bilbo from taking his seat in the Eightieth Congress. A two-day filibuster threatened to block Senate organization. The dilemma was resolved temporarily by permitting Bilbo to return south for a serious operation and to draw salary during his absence, and postponing the question of his taking the oath of office until his recovery.

WAR POWERS

An amended version of the Second War Powers Act renewed the authority of the President to ration and allocate scarce materials, to requisition property, and to give priorities. These powers were extended for one year. A specific provision forbade use of the authority as a means of fixing price ceilings on commodities or rents.

Government agencies were empowered to settle claims of war contractors for losses incurred through no fault of their own between Sept. 16, 1940 and Aug. 14, 1945. The President was authorized to make regulations for settlement. Another act gave original owners the right to reacquire real property, such as hotels, taken by the Government during the war.

WAR SURPLUS

A compromise measure passed in February 1946 authorized sale or charter of $17,000,000,000 worth of surplus ships from the merchant fleet. Minimum prices were fixed at 31½ per cent of cost on Liberty Ships, 35 per cent for all other dry-cargo ships, and 50 per cent for tankers. The maximum for dry-cargo vessels was set at 50 per cent of pre-war domestic cost, for tankers at 87½ per cent. Citizens of the United States and the Philippines were given first chance to obtain the vessels with a provision for sale to foreigners if no offers were received from American citizens.

The House Appropriations Committee, in reporting a deficiency bill, announced that the War Assets Administration expected to dispose of $15,400,000,000 worth of goods and property in the United States for a probable return of $2,900,000 and the Office of the Foreign Liquidation Commission of $3,000,000,000 worth of surplus holdings abroad for approximately $600,000,000 in the fiscal year 1946-1947. The committee praised the efforts of the War Assets Administration but urged a vigorous sales drive to dispose of war surpluses quickly.

The House named a Surplus Property Investigation Committee which held extended sessions in the fall after Congress had adjourned. A report filed with the House Clerk on Sept. 29 accused the War Assets Administration of being careless and confused and urged an inventory of the surplus stocks. The internal administration of the WAA was also criticized. The investigations continued beyond this date with inquiry into many individual transactions.

MISCELLANEOUS

The program of Federal aid to the states for school luncheons was placed on a permanent basis. Federal grants of a "temporary" nature had been made for this purpose for more than ten years.

The domestic rate on air mail was reduced from eight to five cents an ounce. This law became effective on Oct. 1.

A bill to provide a cancer control program was rejected in the House on the grounds that it would not accomplish the goal sought. A particularly controversial measure, the National Health Bill, was still in committee in each house when the session ended. The measure would have established a national social insurance system on a very comprehensive basis, authorized a ten-year program of Federal aid for hospitals and health centers, extended the social insurance system to farmers, domestic workers, and other groups, and provided for a national system of public employment offices. The bill had the backing of the Administration and was the subject of much study in committee.

A bill for a national science foundation under a single administrator passed the Senate but action was not completed on it in the House. The foundation was planned to coordinate and encourage scientific research.

The Anti-Poll-Tax bill was brought before the Senate but discussion was ended after a motion for closure of debate failed to obtain the necessary two-thirds vote.

THE SUPREME COURT AND CONSTITUTIONAL LAW

By Robert E. Cushman
Professor, Cornell University

GENERAL

Chief Justice Harlan F. Stone died April 22, 1946. He was appointed Associate Justice by President Coolidge in 1925, and was elevated to the Chief Justiceship by President F. D. Roosevelt upon the retirement of Chief Justice Charles E. Hughes in 1941. On June 7, President Truman nominated Frederick Moore Vinson, then Secretary of the Treasury, to be Chief Justice of the United States, and the Senate confirmed the nomination on June 20. Mr. Justice James C. McReynolds, who retired from the Court in 1941, died Aug. 24. Mr. Justice Robert H. Jackson, who had been appointed, in May 1945, chief American prosecutor at the trial of Axis war criminals at Nuremberg did not return to the Court until October, 1946. On June 10 Mr. Justice Jackson in Nuremberg released to the press a statement sharply criticizing Mr. Justice Hugo L. Black for his failure to disqualify himself in *Jewell Ridge Coal Corp. v. Local No. 6167, U.M.W.*, 326 U. S. 161 (1945). This case, which awarded coal miners "portal-to-portal" pay under the Fair Labor Standards Act, was decided by a five-to-four vote, and Mr. Justice Black's former law partner was attorney for the union. The statement, unprecedented in judicial history, made public record of a personal antagonism between the two justices, and elicited nationwide press comment. Mr. Justice Black made no reply, and there have been no later repercussions of the incident.

During the year the Court decided 64 cases in which no dissents were filed. In two cases, four justices dissented, and in 29 cases three dissented. The Court overruled one earlier case. This brings the list of overruled decisions since 1937 to 27.

TRENDS AND GROUPING

The decisions of the Court fell roughly into five groups. First, the war brought cases dealing with the validity of martial rule in Hawaii, and the procedural soundness of the military trials of Japanese Generals Yamashita and Homma. Second, a substantial number of cases raised civil liberty issues both on the Federal and state level. Here belong the cases involving the postal censorship affecting *Esquire Magazine,* the right of Congress to deny salary to Federal employees alleged to be subversive, the granting of naturalization to those unwilling to bear arms, and certain phases of religious liberty and freedom of the press. Third, a group of cases presented important questions to the Court which, on the ground that they were "political" in nature, the Court declined to answer. The most important of these involved an attempt to secure the invalidating of the present inequitable Congressional districting of the State of Illinois. Fourth, problems of Federal-state relations were presented by the Federal taxation of the state sale of mineral waters, the application of O.P.A. price controls to sales made by states and counties, and a varied list of state taxes and police regulations applied either to the Federal Government itself or to interstate commerce. Notable here is the case holding that racial segregation on interstate buses invalidly obstructs interstate commerce. Finally, important decisions, which involved no constitutional issues, construed the Federal Fair Labor Standards Act. Of these the most important was the "portal-to-portal" pay case which set the stage for the suits later brought by labor unions to recover billions of dollars by the same method. The trends most clearly discernible are the fairly consistent protection accorded to civil liberties, the generous treatment accorded to labor, and the adherence to the doctrine of the supremacy of Federal law and interests when these were brought into conflict with state law.

MARTIAL RULE IN HAWAII

Martial rule was established in the Territory of Hawaii on the day of the attack on Pearl Harbor, continued until ended by Presidential Proclamation in October, 1944, and was held by the Supreme Court to have been invalid in *Duncan v. Kahanamoku* (with which was combined *White v. Steer*) in February, 1946. The martial rule thus established was absolute. The military authorities actually took over the government of Hawaii in its entirety. The writ of habeas corpus was suspended, the Commanding General announced that he had "assumed the office of military governor of Hawaii," subsequent legislative acts took the form of General Orders, civil and criminal courts were forbidden to open and were replaced by military commissions and provost courts. As time went on, these restrictions were relaxed in minor ways. Civilian courts as, "agents of the Military Governor," were allowed to handle certain types of civil cases, but were not allowed to summon either grand or trial juries, or exercise criminal jurisdiction. White, a stockbroker having no connection with the armed forces, was charged with embezzling stock belonging to another civilian. He was arrested in August, 1942, tried by a provost court without a jury, and sentenced to five years' imprisonment. Duncan, a civilian shipfitter employed at the Navy Yard at Honolulu, was arrested in February 1944, for assault committed in the course of a brawl with two Marine sentries at the yard. By this time, the civil courts of the Territory were again handling ordinary criminal cases, but military courts still retained jurisdiction to try "criminal prosecutions for violations of military orders." Duncan was charged with violating one of these orders and was tried by a military court, although assault is a crime under the territorial law. White and Duncan sought release through writs of habeas corpus issued by the district court. The military authorities denied the court's right to issue habeas corpus. The district court held that there was no military necessity for the trial of the prisoners by military tribunals, that the trials were therefore void, and that the prisoners should be released. The Circuit Court of Appeals reversed this decision, and the Supreme Court granted certiorari.

In an opinion by Mr. Justice Black, the Supreme Court held the military trials invalid and ordered the prisoners released. Martial law in Hawaii had been established under the authority of Section 67 of the Hawaiian Organic Act of 1900 which empowered the Territorial Governor "in case of rebellion or invasion, or imminent danger thereof, when the public safety requires it," to suspend the writ of habeas corpus, or place the territory "under martial law." The issue is: "Did the Organic Act during the period of martial law give the armed forces power to supplant all civilian laws and to substitute military for judicial trials under the conditions that existed in Hawaii at the time these petitioners were tried?" The Court found that the language of the Organic Act "fails to define adequately the scope of the power given to the military and to show whether the Organic Act provides that courts of law be supplanted by military tribunals." Nor does the legislative history of the Organic Act answer the question. It does show, however, "that Congress did not intend the Constitution to have a limited application to Hawaii," and therefore "whatever power the Organic Act gave the Hawaiian military authorities, such power must . . . be construed in the same way as a grant of power to troops stationed in any one of the states."

The Court held, therefore, that the nature and degree of military power in Hawaii must be measured by "the principles and practices developed during the birth and growth of our political institutions." A brief review of the history of civil-military relations justifies the conclusion that national policy has been opposed to the supplanting of civil courts by military tribunals. In the only case in which the Supreme Court ever discussed the problem (*Ex parte Milligan,* 4 Wallace 2, 1866), "it had emphatically declared that 'civil liberty' and this kind of martial law can not endure together; the antagonism is irreconcilable; and, in the conflict, one or the other must perish." The Court concluded, therefore, that, in passing the Hawaiian Organic Act, Congress did not intend, by Section 67, to authorize the supplanting of civilian courts by military tribunals, and the implication is clear that if the statute had authorized this, it would be unconstitutional.

Mr. Justice Murphy concurred, but urged that the military trials were direct and flagrant violations of the Bill of Rights. Chief Justice Stone concurred on the ground that the military authorities had shown no reasons grounded in the public security for closing the civil courts, and that the trials of White and Duncan were, therefore, unauthorized by the Organic Act and "without lawful authority." Mr. Justice Burton, joined by Mr. Justice Frankfurter, dissented on the ground that the Court should not extend judicial control into the realm of executive and military discretion used for the protection of the public security in time of war.

TRIAL OF WAR CRIMINALS—YAMASHITA AND HOMMA

In *In re Yamashita* (Feb. 4) the Court sustained the validity of the trial by a military commission of the Japanese General on charges of violating the law of war. After General Yamashita's surrender in September, 1945, he was held as a prisoner of war and subsequently charged with violations of the laws of war. He was tried before a military commission of five Army officers, found guilty, and sentenced to be hanged. The Supreme Court of the Philippines refused a writ of habeas corpus, and the U. S. Supreme Court, after argument on the merits, did likewise. Chief Justice Stone's opinion disposes of the four attacks made upon the jurisdiction and procedure of the military commission. First, the order creating the commission was issued in strict conformity to the act of Congress "sanctioning the creation of such tribunals for the trial of offences against the law of war committed by enemy combatants." The authority to create such military tribunals is not automatically terminated by the end of hostilities, but continues at least until the formal state of war has been ended by action of the political branch of the government. Second, the charges against the general correctly stated a violation of the law of war. He was charged with failing to "control the operations of the members of his command, permitting them to commit brutal atrocities and other high crimes. . . ." The law of war imposes a positive duty on commanders to take such measures as are in their power to protect prisoners of war and the civilian population. General Yamashita was properly charged with a breach of this duty. Third, the military commission admitted hearsay and opinion evidence as well as depositions against the accused. In the trial of an enemy combatant, this is entirely proper. No act of Congress or treaty dictates the procedure which must be followed in such trials. Control over such procedure lies with the military command. "We hold that the commission's rulings on evidence and on the mode of conducting these proceedings against petitioner are not reviewable by the Courts, but only by the reviewing military authorities. From this viewpoint it is unnecessary to consider what, in other situations, the Fifth Amendment might require. . . ." Fourth, Article 60 of the Geneva Convention of 1929 requires that when a prisoner of war is put on trial the "protecting power" must be at once notified. Switzerland was the power designated by Japan for the protection of Japanese prisoners of war held by the United States. Switzerland was not given notice of Yamashita's trial. The Court held that Article 60 applies only to persons brought to trial for offences committed while prisoners of war.

Justices Murphy and Rutledge filed long and eloquent dissenting opinions. Their principal attack was upon the Court's refusal to apply the test of due process of law to the military commission's procedure. Mr. Justice Murphy said: "No military necessity or other emergency demanded the suspension of the safeguards of due process. Yet petitioner was rushed to trial upon an improper charge, given insufficient time to prepare an adequate defense, deprived of the benefits of some of the most elementary rules of evidence and summarily sentenced to be hanged . . . such a procedure is unworthy of the traditions of our people."

In the case of *In re Homma* (Feb. 4), the Japanese General in command at the time of the "march from Bataan," the same issues were raised as in Yamashita's case. The Court sustained the validity of the military trial without writing an opinion. Again Justices Murphy and Rutledge protested against the denial of procedural due process. Mr. Justice Murphy observed: "Today the lives of Yamashita and Homma, leaders of enemy forces vanquished in the field of battle, are taken without regard to due process of law. There will be few to protest. But tomorrow the precedent here established can be turned against others. A procession of judicial lynchings without due process of law may now follow. No one can foresee the end of this failure of objective thinking and of adherence to our high hopes of a new world . . . a nation must not perish because, in the natural frenzy of the aftermath of war, it abandoned its central theme of the dignity of the human personality and due process of law."

DRAFT ACT CASES

In *Falbo v. United States* (320 U. S. 549, 1944), the Court had denied to a Jehovah's Witness the right to judicial review of the correctness of his classification under the Selective Service Act on the ground that he had failed to exhaust his administrative remedies by submitting to induction. In *Estep v. United States* (Feb. 4), a draft registrant, also a Jehovah's Witness, while protesting his classification, presented himself for induction and then refused to submit to it. He was tried and convicted of violating the statute, but was not allowed in his defense to attack the correctness of his classification by the local board, or to introduce proof that he was in fact a minister of religion. The Court, speaking through Mr. Justice Douglas, granted a new trial. It declined to construe the statute as making final the findings of the local boards on the classification of registrants. To do so would permit them to determine finally their own jurisdiction under the act and even to exceed it. The Court plainly implied that if the statute did preclude judicial review of the correctness of the board's findings it would deny due process of law.

The measure of a veteran's right to reemployment, as defined by the Selective Service Act, was brought before the Court in a suit for a declaratory judgment in *Fishgold v. Sullivan Drydock & Repair Corp.* (May 27). Fishgold was reemployed by the company after his discharge from the Army. After some months, slackened work at the shipyard required the laying off of men. Under a collective bargaining agreement between the company and its men, layoffs were to be governed by seniority, those having higher seniority to be retained longest. Fishgold was laid off although non-veterans having higher shop seniority were kept. The Court, in an opinion by Mr. Justice Douglas. held that this did not violate the statute. The act forbids the discharge of a returned veteran within a year, but a "person who has been laid off . . . would hardly be considered as having been "discharged." Furthermore, the statute does not grant the veteran an increase in seniority over what he would have had if he had never entered the armed services. It merely protects him against loss of ground or demotion upon his return. "There is no suggestion that Congress sought to sweep aside the seniority system. What it undertook to do was to give the veteran protection within the framework of the seniority system."

BILL OF ATTAINDER—CONGRESSIONAL DENIAL OF SALARY TO FEDERAL EMPLOYEES

The most spectacular episode in the campaign by certain committees of Congress to "purge" the Federal service of employees alleged to be disloyal or "subversive" was brought to an end by the Court's decision in *United States v. Lovett* (June 3). In February 1943, Martin Dies, Chairman of the House Committee on Un-American Activities, charged in the House of Representatives that 39 Federal Employees whom he named were Communists or "fellow-travelers" as well as "irresponsible, crackpot, radical bureaucrats." He urged that Congress, then considering the annual appropriation bills, should provide that no funds appropriated by the bills should be used to pay the salaries of these employees. Unwilling to proceed in so summary a fashion, the House set up the so-called "Kerr Committee," a subcommittee of the Committee on Appropriations, to investigate further the loyalty of the accused men and report to the House upon their fitness to hold public office. The Kerr Committee conducted *ex parte* inquiries into the records, views, and writings of nine of the men, exonerated six of them, but reported that Robert Morse Lovett, Secretary of the Virgin Islands, and Gordon B. Watson and William E. Dodd, Jr., both on the staff of the Federal Communications Commission, were found guilty of "subversive activity" and were "unfit" to continue in government service. The administrative superiors of the three employees staunchly defended them and refused to dismiss them. The House thereupon passed a rider to the Urgent Deficiency Appropriation Bill for 1943 providing that no salary or compensation should be paid to Lovett, Watson, or Dodd out of any monies then or thereafter appropriated, except for services as jurors or members of the armed services, unless prior to Nov. 15, 1943, the President with the advice and consent of the Senate again appointed them to positions in the government. The Senate rejected the rider five times by overwhelming majorities, but finally felt compelled to agree. In signing the bill, President Roosevelt stated that he would have vetoed the rider had it been possible to do so, since he regarded it as unconstitutional.

The three men remained at work for varying periods of time at their respective jobs after Nov. 15, but received no salary after that date. They sued in the Court of Claims to recover pay for this post-Nov. 15 work on the ground that the rider depriving them of salary was unconstitutional. The Attorney General declined to represent Congress in this controversy, and Congress was obliged to employ outside counsel to defend the suit. The Department of Justice filed a brief attacking the constitutionality of the congressional rider. The Court of Claims gave the three men judgment on the narrow ground that the legislative rider did not terminate their employment but merely forbade their compensation out of funds generally appropriated, and that therefore their continued employment was valid and that they could secure payment for it from funds allocated to the satisfaction of judgments allowed by the Court of Claims. Two members of the Court held the rider unconstitutional. In the Supreme Court, it was urged on behalf of Congress that the rider was passed in the exercise of the delegated power of Congress over appropriations, which is plenary and not subject to judicial review. On this assumption, the issue of the constitutionality of the rider is not a justiciable controversy. It was also argued that the rider did not purport to terminate the employment of the three men, but merely cut off their pay and therefore could not be regarded as a punitive measure or as a usurpation of the executive power of removal. On behalf of Lovett, Watson, and Dodd, it was argued that the rider was a bill of attainder and an *ex post facto* law, was a legislative usurpation of executive power, and, by discriminating against these three men, deprived them of liberty and property without due process of law.

The opinion of Mr. Justice Black, holding the legislative rider invalid, covered but two points. First, the record presents a justiciable controversy. A résumé of the history of the efforts of the House of Representatives, through its various committees, to uncover "subversive activities" upon the part of Federal employees and to purge the public service of such persons forces the conclusion that the rider was intended to deprive the three men mentioned by it of their employment and to bar them permanently from the Federal service. It was not, therefore, a simple exercise of the power to make appropriations, but was in effect a punitive measure. As such it presents a clearly justiciable issue. Second, the rider must be classified as a bill of attainder. From the two "test oath" cases, *Cummings v. Missouri* (4 Wallace 277, 1867), and *Ex parte Garland* (4 Wallace 333, 1867), the Court derives the definition that "legislative acts, no matter what their form, that apply either to named individuals or to easily ascertainable members of a group in such a way as to inflict punishment on them without judicial trial are bills of attainder prohibited by the Constitution." The legislative denial of "any opportunity to serve the Government is punishment, and of a most severe type." The Court continues: "Section 304 [the rider] thus, clearly accomplishes the punishment of named individuals without a judicial trial. The fact that the punishment is inflicted through the instrumentality of an Act specifically cutting off the pay of certain named individuals found guilty of disloyalty, makes it no less galling or effective than if it had been done by an Act which designated the conduct as criminal. No one would think that Congress could have passed a valid law, stating that after investigation it had found Lovett, Dodd, and Watson 'guilty' of the crime of engaging in 'subversive activities,' defined that term for the first time, and sentenced them to perpetual exclusion from any government employment. Section 304, while it does not use that language, accomplishes that result. The effect was to inflict punishment without the safeguards of a judicial trial and 'determined by no previous law or fixed rule.' The Constitution declares that that can not be done either by a state or by the United States."

POSTAL CENSORSHIP—THE ESQUIRE CASE

In *Hannegan v. Esquire* (Feb. 4). the Court upheld an injunction restraining the Postmaster General from enforcing an order revoking the second-class permit of *Esquire Magazine*. While the decision turned on the interpretation of the postal statutes, rather than the First Amendment, it struck an important blow at arbitrary censorship. *Esquire Magazine* was given a second-class permit in 1933. In 1943 it was ordered by Postmaster General Walker to show cause why the permit should not be suspended or revoked. A hearing was had before a board designated by the Postmaster General, and the board recommended that the permit not be revoked. At this hearing attention was focussed on the question whether the magazine could be regarded as obscene. Numerous persons were called to express opinions upon this question with the divergent and inconclusive results which might have been anticipated. The Postmaster General thereupon overruled the hearing board and revoked *Esquire's* second-class permit. He did not rest this action on the ground that the magazine was obscene and therefore unmailable. He relied rather upon the section of the Classification Act of 1879 which states the conditions under which second-class permits shall issue. The fourth of the conditions there set up reads as follows: "It [the publication] must be originated and published for the dissemination of information of a public character, or devoted to literature, science, arts, or some special industry, and having a legitimate list of subscribers" . . . Publications "designed primarily for advertising purposes" are specifically barred from second-class privileges. The Postmaster General interpreted this provision in the following words: "A publication to enjoy these unique mail privileges and special preferences is bound to do more than refrain from disseminating material which is obscene or bordering on the obscene. It is under a positive duty to contribute to the public good and the public welfare." The Postmaster General is, therefore, empowered to revoke the second-class permit of *Esquire* or any other publication if, in his judgment, it does not thus contribute to the public good.

A unanimous court vigorously rejected the Postmaster General's interpretation of the statute. Speaking through Mr. Justice Douglas, the Court examined the legislative history of the Classification Act and found no evidence of Congressional intention to delegate to the Postmaster General any powers of censorship by the provision here invoked. There is nothing to support the idea "that each applicant for the second-class rate must convince the Postmaster General that his publication positively contributes to the public good or the public welfare." The Court observes ". . . a requirement that literature or art conform to some norm prescribed by an official smacks of an ideology foreign to our system. The basic values implicit in the requirements of the Fourth condition can be served only by uncensored distribution of literature . . . to withdraw the second-class rate from this publication today because its contents seemed to one official not good for the public would sanction withdrawal of the second-class rate tomorrow from another periodical whose social or economic views seemed harmful to another official . . . Congress has left the Postmaster General with no power to prescribe standards for the literature or the art which a mailable periodical disseminates."

NATURALIZATION OF PERSONS UNWILLING TO BEAR ARMS

In three earlier decisions in 1929 and 1931, the Court, in each case by a five-to-four vote, denied citizenship to applicants who refused to swear that they would bear arms in defense of this country, or who put limitations dictated by conscience upon their willingness to do so. These were the cases of *United States v. Schwimmer* (279 U. S. 644, 1929), *United States v. Macintosh* (283 U. S. 605, 1931), and *United States v. Bland* (283 U. S.. 1931). The division in the Court had been emphasized by the persuasive dissents of Mr. Justice Holmes in the *Schwimmer* case, and of Chief Justice Hughes in the *Macintosh* case. In *Girouard v. United States* (April 22) the Court overruled the three cases just named and admitted to citizenship a Seventh Day Adventist who declared himself unwilling to take up arms in defense of this country, but was willing to perform any military service which was not "combatant military duty."

In an opinion by Mr. Justice Douglas the Court emphasized that the crucial issue is one of statutory construction. The statute requires an alien before admission to citizenship to declare on oath in open court that "he will support and defend the Constitution and laws of the United States against all enemies, foreign and domestic, and bear true faith and allegiance to the same." The oath does not in terms require a promise to bear arms, and it is obvious that there are many other ways in which a citizen may support and defend our institutions than by doing so. "Refusal to bear arms is not necessarily a sign of disloyalty or a lack of attachment to our institutions. One may serve his country faithfully and devotedly, though his religious scruples make it impossible for him to shoulder a rifle."

The oath required of Federal officers is "in no material respect different from that prescribed for aliens under the Naturalization Act." This oath does not disqualify conscientious objectors from holding Federal office, and there is no evidence that Congress intended to set a stricter standard for admission to citizenship than for officials of the government. This construction of the act is supported by the legislation of 1942 under which aliens who served honorably in the armed forces of the United States may expedite their naturalization. They must take the same oath, but the statute plainly applies to noncombatants as well as combatants. The Court relies chiefly, however, upon the doctrine and the tradition of freedom of thought and freedom of religion so powerfully presented in Holmes' classic dissent in the *Schwimmer* case. It is unwilling to ascribe to Congress, in the absence of the most cogent evidence, a willingness to depart from the traditional protection of this freedom of thought. Chief Justice Stone, joined by Justices Reed and Frankfurter, dissented on the ground that Congress, by 15 years of silence and inaction, must be held to have adopted and confirmed the construction placed by the Court upon the Naturalization Act in the *Schwimmer* and *Macintosh* cases. The Chief Justice had himself dissented in the *Macintosh* and *Bland* cases, but argued that since no constitutional point was involved, the rule of those cases must now be changed, if at all, by Congress and not by the Court.

FREEDOM OF THE PRESS AND RELIGION

Cases involving freedom of the press and religion announced no new doctrine, but extended the reach of previously established principles. The case of *Pennekamp v. Florida* (June 3), turned on an issue almost identical with that in *Bridges v. California* (314 U. S. 252, 1941). Pennekamp, associate editor of a Florida newspaper, was cited for contempt by a Florida circuit court. The contempt action was based on two editorials criticizing the circuit court and its judges for its handling of certain criminal cases then pending before the court. The editorials portrayed the court as obstructing the efficient enforcement of the criminal law by the unjustified quashing of indictments and the use of other legal technicalities. The inference suggested was that the Court was willfully extending protection to lawbreakers. The record showed that the editorials contained "halftruths," did not "fairly report the proceedings of the court," and contained "misinformation."

Speaking through Mr. Justice Reed,

the Court reversed the conviction on the ground that there was no adequate showing of "clear and present danger" to the fair and efficient administration of justice. The editorials did not comment on evidence or rulings made during a jury trial, but were directed solely against the judges. As in the *Bridges* case, the Court suggested that able and courageous judges would not be influenced by such newspaper comment. "Freedom of discussion should be given the widest range compatible with the essential requirement of the fair and orderly administration of justice." The contempt citation was held to deny due process of law.

Marsh v. Alabama (Jan. 7) and *Tucker v. Texas* (Jan. 7) upheld as a protected exercise of religious liberty the right of Jehovah's Witnesses to distribute religious literature on the streets of a company owned town and a federally owned village built and managed by the Federal Public Housing Authority. In the *Marsh* case, conviction was for the violation of a state statute making it a crime to enter or remain on the premises of another after having been warned not to do so. Tucker's conviction was under a statute making it an offense for "any peddler or hawker of merchandise" wilfully to refuse to leave the premises after having been notified to do so by the owner.

Mr. Justice Black wrote both opinions. It is well established that states and municipalities can not bar the distribution of religious or political literature on their streets, or make such distribution dependent upon the payment of a tax, or subject to the permission of an official who could deny it at will. The fact of the private ownership of the land in these cases is not controlling. Ownership does not mean absolute dominion. When an owner opens up his property for use by the public, his rights become circumscribed by the statutory and constitutional rights of those who use it. The public has an interest "in the functioning of the community in such a manner that the channels of communication remain free." A state statute, which enforces curtailment by the owner of the land, of liberty, of press and religion, violates the First and Fourteenth Amendments. "When we balance the Constitutional rights of owners of property against those of the people to enjoy freedom of press and religion, as we must here, we remain mindful of the fact that the latter occupy a preferred position." In the *Tucker* case it is stated that neither Congress nor any Federal agency acting under its authority could abridge religious liberty, nor is there any indication in the Federal statutes or the Housing Authority Regulations of any intention to do so. In both cases Chief Justice Stone and Justices Reed and Burton dissented.

FEDERAL JURIES—EXCLUSION OF WAGE-EARNERS AND WOMEN

In *Thiel v. Southern Pacific Co.* (May 20), the Supreme Court ordered retrial in a case in a Federal district court which had been tried before a jury drawn from a panel from which wage-earners had been systematically excluded. The case involved a suit brought against the railroad by an injured passenger. The plaintiff moved to strike out the entire jury panel on the ground that it comprised "mostly business executives or those having the employer's viewpoint." As it turned out, five of the 12 jurors drawn were found to "belong more closely and intimately with the working man and the employee class than they do with any other class." However, the undisputed evidence of the clerk of the Court and the jury commissioner was that "they deliberately and intentionally excluded from the jury lists all persons who work for a daily wage." The motive for this exclusion was the protection of wage-earners from the financial sacrifice involved in serving as jurors at $4 a day when prevailing wage rates are much higher. This did not meet the Court's objection.

Mr. Justice Murphy stated the Court's position as follows: "The American tradition of trial by jury, considered in connection with either criminal or civil proceedings, necessarily contemplates an impartial jury drawn from a cross-section of the community. . . . This does not mean, of course, that every jury must contain representatives of all the economic, social, religious, racial, political and geographical groups of the community; frequently such complete representation would be impossible. But it does mean that prospective jurors shall be selected by court officials without systematic and intentional exclusion of any of these groups. Recognition must be given to the fact that those eligible for jury service are to be found in every stratum of society. Jury competence is an individual rather than a group or class matter. That fact lies at the very heart of the jury system. To disregard it is to open the door to class distinctions and discriminations which are abhorrent to the democratic ideals of trial by jury." This, however, would not prevent a trial judge from excusing from jury duty a daily wage-earner for whom such service would mean undue financial hardship.

The principle just stated was applied in *Ballard v. United States* (Dec. 9) to order retrial in a case in a Federal court in which women had been systematically excluded from the jury panel. The trial was held in California. In California, women are eligible for jury service under local law. Congress has provided that jurors in a Federal court shall have the same qualifications as those of the highest court of law in the state. Women were therefore eligible for jury service in Federal courts in California. Their systematic exclusion from the jury panel accordingly violates the principle stated in the *Thiel* case that a jury must be drawn from a cross-section of the community. It is a departure from the scheme of jury selection provided for by Congress. The facts of this case made it unnecessary for the Court to answer the question whether the doctrine of the *Thiel* case would forbid on constitutional grounds the exclusion of women from Federal juries in states whose laws do not make women eligible for jury service in state courts. Four justices, including Chief Justice Vinson, dissented in this case.

POLITICAL QUESTIONS—ILLINOIS CONGRESSIONAL DISTRICT CASE

In 1901 the Illinois legislature apportioned the state into 25 congressional districts, and has not since changed them. Drastic changes in population have occurred since that date, and Chicago now has 43 per cent of the state's total. The population of the congressional districts now ranges from 112,116 to 914,000. Year by year these inequalities have grown more grotesque. Efforts to compel reapportionment by resort to the state courts had failed. *Colegrove v. Green* (June 10) started as a suit for a declaratory judgment against the state officers comprising the State Primary Certifying Board, the effect of which would be to declare the present congressional apportionment invalid and require the election of all representatives from Illinois on a statewide ballot until the legislature passed a valid districting statute. Precedent for such a ruling is found in *Smiley v. Holm* (285 U. S. 355, 1932), in which the Court ordered representatives from Minnesota elected at large after the state's representation in Congress had been reduced from ten to nine after the Census of 1930 and the state had failed to pass a valid redistricting statute. The plaintiffs also argued that the existing inequalities in the Illinois apportionment of representatives deprive them of the equal protection of the laws, and abridge their privileges as citizens of the United States by depriving them of the constitutional right to have their votes cast in a congressional election counted at their full value. The district court dismissed the suit on the authority of *Wood v. Broom* (287 U. S. 1, 1932), in which the Court refused to pass upon the validity of a gerrymander in Mississippi because Congress had omitted from the Apportionment Act of 1929 the provision (contained in all earlier acts since 1872) that congressional districts be composed of "contiguous and compact territory, and contain as nearly as practicable an equal number of inhabitants."

A Supreme Court of seven, dividing four to three, dismissed the suit. Announcing the judgment of the Court, Mr. Justice Frankfurter declared that the case could be disposed of on the authority of *Wood v. Broom.* He went further, however, and held that the issue raised is non-justiciable. It belongs to the class of controversies which are of "a peculiarly political nature and therefore not meet for judicial determination." After a lengthy analysis of the complexities, controversies, and partisan conflicts bound up in the history of legislative apportionment, with its numerous disparities and gerrymanders, he concluded "Courts ought not to enter this political thicket. The remedy for unfairness in districting is to secure state legislatures that will apportion properly, or to invoke the ample powers of Congress." Mr. Justice Rutledge concurred. He was unwilling, for fear of upsetting *Smiley v. Holm,* to hold that questions regarding apportionment are non-justiciable. He supported the Court's refusal to decide the case on the ground of want of equity.

A persuasive dissenting opinion by Mr. Justice Black, joined by Justices Douglas and Murphy, supports the constitutional arguments of the plaintiffs. The Illinois apportionment of 1901 denies them the equal protection of the laws. "No one would deny that the equal protection clause would also prohibit a law that would expressly give certain citizens a half-vote and others a full vote." But under the existing apportionment certain Illinois citizens will cast a vote only one-ninth as effective as those cast by others. The Illinois act also abridges the privileges of citizens to vote for members of Congress and have their votes fairly counted. This right plainly implies that the votes cast shall be of equal weight. If Illinois had apportioned 23 congressmen to the state's smallest county and one to all the others, nobody would deny that the constitutional rights of citizens had been impaired. The present apportionment is less objectionable only in degree. To call the issues here presented "political" in nature is a mere "play on words." The issues are no more "political" than those in the white primary cases in which the Court has jurisdiction. What the Court is asked to do is exactly what it did in *Smiley v. Holm.* The plaintiff's petition for rehearing was denied by the Court in October, and a motion for reargument before the full bench was denied in November.

An attempt was made to attack in the United States District Court the Georgia "county unit system" of voting which disregards popular votes in a manner analogous to the system of electoral votes by which the President is elected. It was urged that this deprived voters of the equal protection of the laws. The district court denied relief. The appeal taken in this case (*Turman v. Duckworth*) was dismissed by the Supreme Court without opinion. Justices Black, Murphy, and Rutledge thought that argument should have been heard on the merits in order to settle the question of jurisdiction.

FEDERAL-STATE RELATIONS—SUPREMACY OF FEDERAL LAW

In *New York v. United States* (Jan. 14), a divided Court writing four opinions re-examined the doctrine followed in a series of cases beginning in 1905 with *South Carolina v. United States* (199 U. S. 437) which held that although the Federal Government might not tax the activities of a state when engaged in "its ordinary functions as a government," it could validly tax the state when it was engaged in "the carrying on of an ordinary private business." The state sale of liquor is such "an ordinary private business." New York, with 45 other states supporting its legal position, protested the collection by the Federal Government of excise taxes on the state's sale of mineral waters taken from Saratoga Springs. The state urged that such sale was "a usual, traditional and essential governmental function." The six justices upheld the Federal tax but on three different grounds.

Mr. Justice Frankfurter, in announcing the judgment of the Court, rejected the perhaps over-simplified distinction of the South Carolina case doctrine between "proprietary" and "governmental" state functions as determining state immunity from Federal taxation. "To rest the federal taxing power on what is 'normally' conducted by private enterprise in contradiction to the 'usual' governmental functions is too shifting a basis for determining constitutional power and too entangled in expediency to serve as a dependable legal criterion." His position is summed up as follows: "So long as Congress generally taps a source of revenue by whomsoever earned and not uniquely capable of being earned only by a state, the Constitution of the United States does not forbid it merely because its incidence falls also on a state." Mr. Justice Rutledge agreed with this but added that he thought Congress ought to make clear in each case its intention to have general Federal excises fall on state activities. Mr. Justice Reed, joined by Justices Murphy and Burton, stated that the problem can not be solved by a formula. The crucial test should be the actual or potential effect of the immunity from Federal taxation of any state activity upon the revenue power of the Federal Government. "The effect of the immunity on the national taxing power is to be determined not quantitatively but by its operation and tendency in withdrawing property or activities from the reach of federal taxation. Not the extent to which a particular State engages in the activity, but the nature and extent of the activity by whomsoever performed is the relevant consideration." Mr. Justice Douglas, joined by Justice Black, dissented in an opinion which rejects as unsound the doctrine of the South Carolina case or any other doctrine which supports the Federal taxation of any state activity, no matter what its nature may be. "The major objection is that it disregards the Tenth Amendment, places the sovereign states upon the same plane as private citizens, and makes the sovereign states pay the federal government for the privilege of exercising the powers of sovereignty guaranteed them by the Constitution." Thus, in a situation already complex, the Court has made four theories grow where only one grew before.

OPA REGULATIONS APPLICABLE TO STATES AND COUNTIES

The Washington State Commissioner of Public Lands held an auction sale of school land (land-grant) timber. A lumber company made a bid for the timber which was higher than the OPA ceiling price. The Federal Price Administrator sought an injunction restraining the completion of the sale at the bid price. The state defended the action on the ground that the Emergency Price Control Act was not intended by Congress to apply to the states, and that if it did so apply it violated the Fifth and Tenth Amendments. In *Case v. Bowles* (Feb. 4), the Court, in an opinion by Mr. Justice Black, sustained the injunction. Congress plainly intended the statute to apply to the states and their political subdivisions, and the Court will not frustrate the purpose of Congress by reading into its provisions exemptions which Congress did not see fit to put there.

The argument based on the Tenth Amendment is disposed of as follows: "Since the decision in *McCulloch v. Maryland,* it has seldom if ever been doubted that Congress has power in order to attain a legitimate end . . to use all appropriate means plainly adapted to that end. . . . And we have said, that the Tenth Amendment 'does not operate as a limitation upon the powers, express or implied, delegated to the National Government.' . . . Where as here, Congress has enacted legislation authorized by its granted powers, and where at the same time, a state has a conflicting law, which but for the Congressional Act would be valid, the Constitution marks the course for courts to follow." In *Hulbert v. Twin Falls County* (Feb. 4), OPA regulations were held applicable to the sale of tractors by

U OF I
LIBRARY

a county. Mr. Justice Douglas dissented in both cases on the ground that the intent of Congress to apply OPA controls to the states was not clear.

SEGREGATION OF NEGROES BY STATE LAW ON INTERSTATE BUSES

Of the cases involving the validity of state police regulations affecting interstate commerce, the most important was *Morgan v. Virginia* (June 3) in which the Court held that a Virginia statute requiring the segregation of Negroes and whites on interstate buses unduly burdened interstate commerce. Mr. Justice Reed for the Court emphasized that in the field of transportation where Congress has not acted, "a state may validly enact legislation which has predominantly only a local influence on the course of commerce." State statutes regulating racial association on interstate vehicles have much more than a local influence. Bus transportation reaches all over the country. Eighteen states prohibit racial segregation on public carriers, while ten states require segregation on motor carriers. The enforcement of these state laws against carriers engaged in interstate transportation produces cumulative inconveniences and burdens, among which are the repeated shifting of seats upon reaching state lines as well as the difficulties of applying the various definitions used to identify white and colored passengers. In *Hall v. De Cuir* (95 U. S. 485, 1877), the Court held that interstate commerce was invalidly burdened by a state law forbidding racial segregation on public conveyances. "The transportation difficulties arising from a statute that requires commingling of the races, as in the *De Cuir* case, are increased by one that requires separation, as here." The Court concludes: "It seems clear to us that seating arrangements for the different races in interstate motor travel require a single, uniform rule to promote and protect national travel. Consequently, we hold the Virginia statute in controversy invalid."

FAIR LABOR STANDARDS ACT

In several cases the Court added to its already long list of employments subject to the provisions of the Fair Labor Standards Act on the basis of their connection with interstate commerce. *Maybee v. White Plains Publishing Co.* (Feb. 11) held the act applicable to the employees of a newspaper with a daily circulation of 11,000, one-half of one per cent of which went out of the state. In *Martino v. Michigan Window Cleaning Co.* (Feb. 4), the act was applied to the employees of a company whose business was to clean the windows of buildings the occupants of which were engaged in the production of goods for interstate commerce. In *Roland Electric Co. v. Walling* (Jan. 28), the company was engaged in "commercial and industrial wiring, electrical contracting, and dealing in electrical motors and generators, for private, commercial and industrial uses." Its customers, or some of them, were engaged in interstate commerce. Its employees were held to be covered by the Fair Labor Standards Act. In *Boutell v. Walling* (Feb. 25), the employees held to be covered by the act were mechanics engaged in greasing and repairing motor vehicles which were rented for the transportation of automobiles and army equipment in interstate commerce.

PORTAL-TO-PORTAL PAY CASE—MT. CLEMENS POTTERY CASE

In *Anderson v. Mt. Clemens Pottery Co.* (June 10), the Court was faced with claims of factory workers, grounded on the provisions of the Fair Labor Standards Act, for overtime compensation for periods of time, prior to the beginning and after the end of the standard working day, during which they engaged in activities incidental to their employment. It was this decision which set the stage for the suits totaling billions of dollars later brought by a large number of labor unions for so-called "portal-to-portal" pay. The facts in the case are complex. The company employs about 1,200 men, 95 per cent of whom are paid on a piece-work basis. The plant covers eight acres and is a quarter of a mile long. Whistles are blown for the different shifts to indicate when actual working time begins and ends. A period of 14 minutes before starting time allows employees to enter the plant, punch the time clock, walk to their places of work, change their clothes, prepare materials, etc. for work. A 14-minute period is also allowed after the end of the work period to enable the men to get ready to leave, and punch the time clock. The time for which the employees are paid extends from the next even quarter hour after they punch in to the quarter hour just before the time when they punch out. "Thus an employee who punches in at 6:46 a.m., punches out at 12:14 p.m., punches in again at 12:46 p.m., and finally punches out at 4:14 p.m., is credited with having worked the 8 hours between 7 a.m. and 12 noon and between 1 p.m. and 4 p.m.—a total of 56 minutes less than the time recorded by the time clocks."

The suit was started to recover overtime pay for this additional time of approximately 56 minutes per day. The district court appointed a master to make a finding of facts. The master recommended that the suit be dismissed on the ground that the employees had not established their claims by a "fair preponderance of evidence." He found that the time spent in walking from the entrance to the place of work need not be paid for in view of the established custom of the industry. The time spent in preliminary duties after arriving at the place of work was not compensable since the employees had produced no reliable figures to show the actual amount of such time. The time spent in waiting before and after shift periods need not be paid for because it was not shown that the employees were required to put in this waiting time or that they did not use it for their own purposes. The district court accepted most of these findings but made one modification. It allowed compensation, not for the four 14-minute periods, but for a little less than half this amount of time on the theory that the men probably began productive work this much ahead of the scheduled time inasmuch as they worked piece work, and it would be to their advantage to do so. The Circuit Court of Appeals agreed with the master and dismissed the suit on the ground that the employees had not sustained the burden of proving by a preponderance of evidence that they were not being paid the wages to which they were entitled.

Mr. Justice Murphy spoke for the Court in a decision which upheld the claims of the plaintiffs, and sent the case back to the district court for determination of the actual amount of time for which additional pay was due. The Court made the following points. First, the employee does not assume under the statute the burden of proving by accurate figures the precise amount of overtime for which he claims compensation. It is upon the employer, not the employee, that the act places the duty of keeping accurate records of working time and other relevant facts. It is sufficient if the employee proves "that he has in fact performed work for which he was improperly compensated and if he produces sufficient evidence to show the amount and extent of that work as a matter of just and reasonable inference." Second, the employees did not prove that they were engaged in work from the time they punched in to the time they punched out. It is recognized that the time-clock records can not accurately register actual working time, and they can not, therefore, be made the sole basis of determining the statutory workweek. Third, they did prove that they had to be on the premises for some time before actually beginning work. Some of this time was spent in walking to the place of work, and some of it was used in various preliminary activities necessary for the beginning of productive work, and therefore carried on for the employer's benefit. The time used in these two ways is "working time" within the meaning of the statute and must be paid for. The Court recognized that in some instances the amounts of time involved might be so small as to be negligible. "Split-second absurdities are not justified by the actualities of working conditions or by the policy of the Fair Labor Standards Act. It is only when an employee is required to give up a substantial measure of his time and effort that compensable working time is involved." The evidence indicated that the amounts of time here involved were substantial and this justifies the Court's direction that these amounts be accurately measured so that compensation and damages could be determined.

"DEATH SENTENCE" PROVISION OF THE PUBLIC UTILITY HOLDING COMPANY ACT

In *Electric Bond & Share Co. v. Securities and Exchange Commission* (303 U. S. 419) in 1938, the Court held valid the provisions of the Public Utility Holding Company Act of 1935 which required holding companies to register with the commission and forbade them to use the mails or interstate commerce if they failed to do so. The Court did not, however, pass upon the validity of the famous "death sentence" provision of the statute which provided that as soon as practicable after Jan. 1, 1938, the Securities and Exchange Commission should "require by order, after notice and opportunity for hearing, that each registered holding company, and each subsidiary company thereof, shall take such steps as the Commission shall find necessary to insure that the corporate structure or continued existence of any company in the holding-company system does not unduly or unnecessarily complicate the structure, or unfairly or inequitably distribute voting power among security holders, of such holding company system."

In *American Power & Light Co. v. Securities and Exchange Commission* (Nov. 25), the Court, without dissent, held this "death sentence" provision constitutional. The case arose from an order of the Commission directing the dissolution of the American Power & Light Co. and the Electric Power & Light Corporation as holding companies whose continued existence violated the standards stated in the "death sentence" provision. The Court's opinion covered the following points: First, the provision is valid under the commerce clause. "Congress, of course, has undoubted power under the commerce clause to impose relevant conditions and requirements on those who use the channels of interstate commerce so that those channels will not be conduits for promoting or perpetuating economic evils." Second, the Court finds no unconstitutional delegation of legislative power to the Commission. Sufficiently clear standards are set up for its guidance. Third, there is no denial of due process in the procedures by which the Commission is required to act under the "death sentence" provision, or by which it did act in the present case. Fourth, the Commission acted within the range of its statutory discretion in determining that dissolution of the two holding companies was necessary in order to meet the standards established by Congress. The act plainly contemplates dissolution as one of the available methods of accomplishing the purpose of the act. The Commission was not, therefore, exceeding its power because less drastic alternative methods might have been tried. The Commission considered alternative plans and rejected them.

FEDERAL ADMINISTRATIVE AGENCIES

By John A. Tillema
Professor, George Washington University

REJECTION OF REORGANIZATION PLAN NO. 1

On May 16, 1946, President Truman, in pursuance of the Reorganization Act of Dec. 20, 1945, submitted to Congress three Reorganization Plans. Of these, Plan No. 1 was rejected by both the Senate and the House of Representatives by substantial majorities, because it provided for the retention of such government enterprises as Federal Housing. Objection was also raised to the circumstance that this plan provided for the retention of too large an administrative personnel. The main features of Plan No. 2 and Plan No. 3 which were approved are as follows:

REORGANIZATION PLAN NO. 2 (1946)

Section 1, Children's Bureau.—(a) The Children's Bureau in the Department of Labor, exclusive of the industrial division, was transferred to the Federal Security Agency. (b) The functions of the Children's Bureau and of the Chief of the Children's Bureau under the Fair Labor Standards Act of 1938 were transferred to the Secretary of Labor.

Section 2, Vital Statistics.—The functions of the Secretary of Commerce, the Bureau of Census and the Director of the Bureau of Census were transferred to the Federal Security Administrator to be performed under his direction and control by the United States Health Service or by such officers and employees of the Federal Security Agency as the Administrator shall designate.

Section 3, United States Employees Compensation Commission.—The functions of this agency were transferred to the Federal Security Agency to be performed under such rules and regulations as the Administrator shall direct, except that the regulations shall provide for a board of three persons to be designated or appointed by the Security Administrator with authority to hear and make final decisions on appeals taken from determinations and awards with respect to claims of employees of the Federal Government or of the District of Columbia. The United States Employees Compensation Commission was abolished.

Section 4, Social Security Board.—The Social Security Board was abolished and its functions transferred to the Federal Security Administrator.

Section 5, Assistant Heads of Federal Security Agency.—In addition to the existing Federal Security Administrator, there are to be not more than three assistant heads of the Federal Security Agency, each of whom is to be appointed by the Administrator under the classified Civil Service and to receive a salary of $10,000 per annum.

Section 6, Functions Respecting the Blind.—These functions belonging to the Office of Education under the Act of June 30, 1936, were transferred to the Federal Security Administrator.

Section 7, Assistant Commissioner of Education.—The Office of the Assistant Commissioner of Education was abolished and the functions transferred to the Office of Education to be under the control of the Commissioner of Education.

Section 8, Federal Board for Vocational Education.—This board and all its functions were abolished.

Section 9, Board of Visitors of St. Elizabeth's Hospital.—This board and all its functions were also abolished.

Section 10, Coordination of Grant-in-Aid Programs.—To coordinate fuller grant-in-aid programs by officers and units of the Federal Security

Agency, the Federal Security Administrator was directed to establish in so far as practicable (a) uniform standards and procedures relating to fiscal, personnel, and other requirements common to two or more such programs, and (b) standards and procedures under which a state agency participating in more than one such program may submit a single plan and be subject to a single Federal fiscal and administrative review of the operation.

REORGANIZATION PLAN NO. 3 (1946)

Part I, Department of the Treasury.—*Section 101, Functions transferred to the United States Coast Guard.* (a) There were transferred to the Commandant of the Coast Guard the functions of the Bureau of Marine Inspection and Navigation, the functions of the Board of Supervising Inspectors, the Board of Local Inspectors, the Marine Casualty Investigation Board. The Boards named were abolished.

There were transferred from the Secretary of Commerce to the Commandant of the Coast Guard the functions which pertain to the approval of plans for the construction, repair, and alteration of vessels: approval of material, equipment, and appliances; classification of vessels; inspection of vessels and their equipment and appliances; issuance of certificates of inspection and of permits indicating the approval of vessels for operations which may be hazardous to life or property; administration of load line requirements; enforcement of other provisions for the safety of life and property on vessels; licensing and certification of officers, pilots, and seamen; suspension and revocation of licenses and certificates; investigation of marine casualties; enforcement of manning requirements; citizenship requirements, and requirements for the mustering and drilling of crews; control of log books; shipment, discharge, protection, and welfare of merchant seamen; enforcement of duties of shipowners and officers after accidents; promulgation and enforcement of rules for lights, signals, speed, steering, sailing, passing, anchorage, movement, and towlines of vessels and lights and signals on bridges; numbering of undocumented vessels; prescription and enforcement of regulations for outfitting and operation of motorboats; licensing of motorboat operators; regulation of regattas and marine parades; all other functions of such bureau offices and boards not specified in section 102 of the Plan, including remission of fines, penalties, and forfeitures under the laws governing these functions.

Section 102. There were transferred to the Commissioner of Customs those functions of the bureau, offices, and boards specified which pertain to the registry, enrollment, and licensing of vessels, including the issuance of commissions to yachts, the assignment of signal letters and the preparation of all reports and publications in connection therewith; measurement of vessels; administration of tonnage duties and collection of tolls; entry and clearance of vessels and aircraft, regulation of vessels in the coasting and fishing trades, and limitation of the use of foreign vessels in the waters under the jurisdiction of the United States; recording of sales, conveyances and mortgages of vessels; protection of steerage passengers; all other functions of such bureau, offices, and boards which were performed by the Bureau of Customs prior to the effective date of Executive Order No. 9033 of Feb. 28, 1942; and the power to remit and mitigate fines, penalties, and forfeitures incurred under the laws governing these functions.

Section 103. This section provides that the functions transferred by the Plan may be performed by such officers and employees of the Coast Guard and the Bureau of Customs as may be designated by the Commandant of the Coast Guard and the Commissioner of Customs respectively, and shall be performed subject to the control of the Secretary of the Treasury, except as otherwise required by law when the U. S. Coast

Guard is operated as part of the Navy.

Part II, Department of War and Department of the Navy.—*Section 201.* (a) The functions of St. Elizabeth's Hospital and the Superintendent, and of the Federal Security Agency and the Security Administrator with respect to the care, treatment and custody of insane persons were transferred or abolished as follows: 1. Functions with respect to insane persons belonging to the Army. or falling by reason of employment or service within the Army, were transferred to the Secretary of War. 2. Functions with respect to insane persons belonging to the Navy, or falling by reason of prior service within the Navy, were transferred to the Secretary of the Navy. The Marine Corps but not the Coast Guard is included in the Navy. 3. Functions with respect to insane persons belonging to the Coast Guard were abolished.

Part III. — *Section 301, Hydrographic Office and Naval Observatory.* The Hydrographic Office and the Naval Observatory, together with their respective functions, were transferred from the Bureau of Naval Personnel to the Chief of Naval Operations.

Section 302, Supply Department of the United States Marine Corps. The Paymaster's Department of the United States Marine Corps and the Quartermaster's Department of the United States and their functions were consolidated into a new agency known as the Supply Department of the United States Marine Corps. At the head of this Department is placed a Quartermaster General of the Marine Corps. The office and title of Paymaster General was abolished.

Part IV, Department of Interior. —*Section 401.* Certain functions with respect to the Franklin D. Roosevelt Library were transferred to the Secretary of Interior. (a) The functions of the Commissioner of Public Buildings with respect to the care, maintenance, and protection of the buildings and grounds of the Franklin D. Roosevelt Library. (b) The functions of the Archivist of the United States with respect to the collection of fees from persons visiting and viewing the exhibit rooms or museum portions of the library, excluding the fixing of charges to be collected but including the making of all other regulations with respect to such collection.

Section 402, Mineral Deposits in Certain Lands. The functions of the Secretary of Agriculture and the Department of Agriculture with respect to the uses of certain mineral deposits were transferred to the Secretary of the Interior, provided that the mineral development of such lands shall be authorized by the Secretary of the Interior only when advised by the Secretary of Agriculture that it does not interfere with the primary purpose for which the land was acquired and only in accordance with such conditions as may be specified by the Secretary of Agriculture in order to protect such purposes. The provisions of law governing the crediting and distribution of revenues derived from the said lands shall be applicable to revenues derived in connection with the functions transferred. To the extent necessary in connection with the performance of the functions transferred by this section, the Secretary of the Interior shall have access to the records of the Department of Agriculture relating to the lands affected.

Section 403, Bureau of Land Management. (a) The functions of the General Land Office and of the Grazing Service in the Department of the Interior were consolidated to form a new agency in the Department of the Interior known as the Bureau of Land Management. (b) There is placed at the head of the new Bureau a Director of the Bureau of Land Management appointed by the Secretary of Interior under the classified civil service who receives a salary of $10,000 per annum. (c) There are to be in the Bureau of Land Management an associate director and as many assistant directors as may be deemed necessary by the Secretary of the Interior. They are to be appointed by him under the classified civil service and subject to the Classified Act of 1923 as amended. (d) The General Land Office, Grazing Service, offices of Commissioner and Assistant Commissioner of the General Land Office, director and assistant director of the Grazing Service, all registers of the district land offices, United States Supervisor of Surveys, together with the Field Surveying Service, also known as the Cadastral Engineering Service, were abolished.

Part V. Department of Agriculture.—*Section 501.* The following functions were transferred to the Department of Agriculture: (a) All functions of the Agricultural Adjustment Administration and the Surplus Marketing Administration together with the respective heads of these administrations. (b) The administration of programs of the Federal Crop Insurance Corporation and the Commodity Credit Corporation.

Part VI. Department of Commerce.—*Section 601.* Certain functions of the Bureau of Standards were transferred to the Secretary of Commerce: (a) Those functions of the National Bureau of Standards which were performed by the Division of Commercial Standards of that bureau whose functions are (1) to assist, coordinate, and cooperate with groups of consumers, distributors or producers, technical organizations, and other persons, in the voluntary establishment, maintenance, recording, publishing, and promoting commercial standards as a nationally testing, grading, labeling, marketing, guaranteeing, or accepting stable, manufactured commodities moving in daily domestic and foreign trade, and (2) to assist in the development of Federal purchase standards, specifications, and in providing information to the public and the Government of such standards and specifications. (b) Those functions of the Bureau of Standards which were performed by the Division of Simplified Trade and Practises, namely, to assist, coordinate, and cooperate with individuals and groups of producers, distributors, and users in the establishment, recording, publishing, and promoting of a nationwide program for the elimination of avoidable waste through the formulation of simplified trade practise recommendations which identify and list sizes, types, dimensions, and varieties of products that are in national demand, including, but not limited, to such products as wood, textile, paper and rubber, mechanical, electrical, ceramic, construction materials, and metal and wood working tools.

Part VII.—The functions of the National Labor Relations Board with respect to secret ballots of employees on the question of an interruption of war production were abolished.

Part VIII. Smithsonian Institution.—The Board of Directors of the Canal Zone Biological Area was abolished and its functions transferred to the Smithsonian Institution.

Part IX. United States Employment Service.—The placement functions under the Selective Training and Service Act of 1940 were transferred to the U. S. Employment Service.

DIRECTOR OF LIQUIDATION

By Executive order of Jan. 4, 1946, there was established in the Office for Emergency Management of the Executive Office of the President a Director of Liquidation. The Director performs his functions in consultation with a Liquidation Advisory Committee. The Committee is composed of one representative of each of the following: Department of the Treasury, Surplus Property Administration, National Archives, Civil Service Commission, Public Buildings Administration, General Accounting Office, and Bureau of the Budget. The Chairman of the Advisory Committee is selected by the Director from the Committee's membership. The duties of the Director are to further proper preparations and methods for the orderly and timely winding up of the affairs of the temporary Federal agencies created for the purposes of the war.

UNITED STATES OF AMERICA TYPHUS COMMISSION

By order of Jan. 17, 1946, the United States of America Typhus Commission, which had been established in the War Department for the purpose of protecting the members of the armed forces from typhus fever and preventing its introduction into the United States, was directed to be liquidated. The liquidation of the affairs of the Commission and the disposition of the records and scientific data are to be accomplished under the direction of the Secretary of War.

CONSOLIDATION OF SURPLUS PROPERTY FUNCTIONS

By Executive order of Jan. 31, 1946, the functions of the Surplus Property Administrator and the Surplus Property Administration were transferred to the War Assets Corporation and merged in it. All functions of the Surplus Property Administration located outside of the continental United States, Hawaii, Alaska, Aleutians, Puerto Rico, and Virgin Islands were transferred to the Secretary of State and the State Department.

Effective March 26, 1946, there was established in the Office for Emergency Management of the Executive Offices of the President, a War Assets Administration at the head of which is an Administrator appointed by the President with the consent of the Senate. The functions of the War Assets Corporation relative to surplus property were transferred to the War Assets Administrator. There was transferred to the War Assets Administration as much as the Director of the Budget determined to relate primarily to surplus property, respectively of the records, administrative property, personnel and funds of the Surplus Property Administration, the Office of War Mobilization and Reconversion, the Reconstruction Finance Corporation, and the War Assets Corporation.

OFFICE OF ECONOMIC STABILIZATION

By Executive order of Feb. 21, 1946, the Office of Economic Stabilization, together with the Economic Stabilization Director, was reestablished with the same duties, functions, and powers as the one abolished Sept. 20, 1945. The Economic Stabilization Board was also reestablished on the former basis in the Office of Economic Stabilization. The Board was to have the following members: Economic Stabilization Director as Chairman, Secretary of the Treasury, Secretary of Agriculture, Secretary of Commerce, Secretary of Labor, Federal Loan Administrator, Chairman of the Board of Governors of the Federal Reserve System, Director of the Bureau of the Budget, Chairman of the Securities Exchange Commission, Price Administrator, Administrator of the National Housing Agency, Chairman of the National Wage Stabilization Board, and two representatives each of labor, management, and farmers to be appointed by the President.

AIR NAVIGATION FACILITIES

By Executive order of March 29, 1946, there were transferred to the Department of Commerce all functions, facilities, property, records, equipment, and maintenance supplies of the War and Navy Departments relating to the care, control, maintenance, and operation of air navigation, air traffic control, airway communication, and meteorological facilities of the U. S. Government, and all structures and equipment appurtenant thereto or used in connection therewith which are located in foreign territory and elsewhere outside of the continental limits of the United States are (a) determined by the War or Navy Departments to be no longer required for military purposes, (b) are determined by the Department of Commerce to be or likely to become useful in connection with the safe and efficient operation of United States civil aircraft in foreign air commerce, and can be continued in operation with funds available to the Department of Commerce.

The Department of Commerce, in carrying out the provisions of the order and to the extent permitted by law, was authorized to make, with the collaboration and approval of the State Department when the property is located in foreign territory. arrangements with the appropriate agencies of the respective foreign governments, or with an appropriate international agency, or with any air carrier or other suitable private agency, for the interim custody, operation, and maintenance of the facilities transferred to the Department of Commerce.

The Department of Commerce was authorized on behalf of the United States to accept funds from any foreign government or air carrier in payment for services rendered in the operation of the facilities transferred. Such funds shall be covered into the general fund of the Treasury. The provisions of this order are not applicable to any sea or air navigation facilities operated by the Coast Guard, nor to any functions of the Navy Department respecting such facilities.

TERMINATION OF OFFICE OF INTER-AMERICAN AFFAIRS

By Executive order of April 10, 1946, the Office of Inter-American Affairs was terminated and the following transferred to the Secretary of State: Institute of Inter-American Affairs, Inter-American Educational Foundation Inc., Institute of Inter-American Transportation, Inter-American Navigation Corporation, and Prencin-Radio Inc., together with all rights and interests, authority, and obligations of the Director and of his predecessors with respect to such corporations. All other functions of the Director were terminated. The Director was required to take such steps as might be necessary to effect the purposes of the order, including the turning over to the Secretary of State of the Capital stock of the named Corporations.

The duty of winding up all terminated facilities of the Office was turned over to the Secretary of State So much of the personnel as might be needed by the Department of State were to be retained. The rest were to be separated from the service or transferred to other government agencies.

PETROLEUM ADMINISTRATION FOR WAR

By Executive order of May 3, 1946, the Petroleum Administration for War was terminated. The Secretary of the Interior, acting through agencies of the Department of the Interior as he should designate, was directed to wind up the affairs of the Administration and to utilize therefor as much of the personnel, records, property, and funds of the Administration as might be necessary.

PRESIDENT'S RELIEF CONTROL BOARD

By Executive order of May 14, 1946, the President's Relief Control Board, which had been created July 15, 1942, was terminated. The Secretary of State was directed to liquidate all the activities and obligations as rapidly as practicable and to utilize therefor such personnel, property, records, and unexpended appropriations of the Board as might be necessary.

TRANSFER OF FISCAL FUNCTION OF LEND LEASE

By Executive order of May 17, 1946, all functions with respect to the maintenance of accounts and other fiscal records relating to lend lease and reverse lend lease were transferred to the Department of the Treasury to be administered under the direction of the Secretary of the Treasury. All other functions were to continue to be administered by the Department of State.

CABINET COMMITTEE ON PALESTINE

By reason of the urgency of the solution of the various problems relating to the displaced Jews in Europe and to Palestine there was established by Executive order of June 11, 1946, a cabinet committee on Palestine, composed of the Secretary of State, as chairman, the Secretary of War, and the Secretary of the Treasury. Its functions and duties were declared to be as follows: (a) to assist the President in the early consideration of the recommendations of the Anglo-American Committee of Inquiry, and of the views which may be submitted as a result of the consultations thereon as well as the determination of the steps to be taken by this Government in regard to Palestine and related problems; (b) To propose the specific measures considered necessary or appropriate effectively to implement the decisions made by the President in regard to Palestine and related problems; (c) So far as may be permitted by law to implement and coordinate, either directly or through the appropriate departments and agencies of the U. S. Government, such policies and programs as may be approved and authorized by the President; (d) To perform such other tasks in connection with the functions and duties described as the President may from time to time direct.

Each member of the Committee is required to designate a fully deputized alternate to act for and in his behalf. The alternates thus selected are to function as the executive agency of the committee and to be known as the Board of Alternates. whose chairman is the alternate for the Secretary of State.

WAR RELOCATION AUTHORITY

By Executive order of June 25, 1946, this agency, which had been established by Executive order March 18, 1942 and transferred to the Department of the Interior Feb. 16. 1944, was terminated as an organizational entity within the Department. The office of Director of War Relocation was abolished and the Secretary of the Interior was directed to wind up the affairs of the Authority.

CONTINUING FUNCTIONS OF OFFICE OF PRICE ADMINISTRATION

Although the Emergency Price Control Act of 1942 and the Stabilization Act of the same year were terminated as of June 30, 1946, by Executive order of that date, the Office Administration and the Price Administrator were directed to continue to exercise and perform all those functions, powers, and duties which did not terminate with the acts mentioned. These functions deal particularly with offenses committed or rights and liabilities incurred thereunder prior to the termination date.

DIPLOMATIC AND CONSULAR ESTABLISHMENTS IN THE PHILIPPINE ISLANDS

By Proclamation 2694 of July 8, 1946, the President of the United States designated all lands and buildings pertaining to the official residences of the United States High Commissioner of the Philippine Islands in the cities of Manila and Baguio, together with all fixtures and movable objects, to be Diplomatic and Consular Establishments of the United States. He directed the Secretary of State, on behalf of the United States, to enter suitable negotiations for the acquisition of title to any described properties, the title of which was not in the United States.

INDEPENDENCE OF PHILIPPINE ISLANDS

By another Proclamation of June 8, 1946, the Independence of the Philippine Islands was proclaimed to the world. The President was acting under an Act of Congress approved March 24, 1934, known as the Philippine Independence Act, which directed that on July 4, immediately following a ten-year transition period, the President should by proclamation withdraw and surrender all rights of possession, supervision, control, or sovereignty of the United States.

PHILIPPINE ALIEN PROPERTY CUSTODIAN

By Executive order of Oct. 14, 1946, there was established in the Office for Emergency Management of the Executive Offices of the President, the Philippine Alien Property Administration headed by an Administrator appointed without regard to the civil service laws. All authority, rights, privileges, powers, duties, and functions vested in the Office of Alien Property Custodian with respect to property located in the Philippines were transferred to the Philippine Alien Property Custodian.

TRANSFER OF AIR FACILITIES

By Executive order of Nov. 6, 1946, there were transferred to the Department of Commerce: (a) all facilities, property, equipment, and maintenance supplies of the War and Navy Departments relating to the care, control, maintenance and operation of air navigation facilities (including airports and associated airport facilities of the United States Government which (1) are located at points in Alaska and elsewhere outside the continental limits of the United States but not in foreign territory; (2) are determined by the War or Navy Departments to be no longer required for military purposes; (3) are determined by the Department of Commerce likely to become reasonably necessary in connection with the safe and efficient operation of the United States civil aircraft. All functions relating to the care, control, maintenance and operation of the facilities, property, and equipment were transferred to the Department of Commerce. The order does not cover those sea and air facilities now operated by the Coast Guard. In case of military necessity the Secretary of the Navy or of War shall have the right to take over immediately any facilities transferred, together with improvements thereto.

OFFICE OF TEMPORARY CONTROLS

By Executive order of Dec. 12, 1946, to effectuate the transition from war to peace and in the interest of the internal management of the Government, the following were consolidated to form one agency in the Office for Emergency Management in the Executive Office of the President: Office of War Mobilization and Reconversion, Office of Economic Stabilization, Office of Price Administration, and Civilian Production Administration. The new agency is known as the Office of Temporary Controls. There is at the head of the new office an Administrator who shall receive $12,000 unless Congress shall otherwise provide.

The functions of the Media Programming Division of the Motion Picture Division of the Office of War Mobilization and Reconversion and the functions which were transferred from the Bureau of Services of the Office of War Information to the Bureau of the Budget by order of Aug. 3, 1944, were transferred to the Office of Government Reports, which was reestablished as an agency in the Executive Office of the President.

ELECTIONS OF 1946

By Thomas N. Hoover*

Professor, Ohio University

REPUBLICAN CONTROL OF CONGRESS

Interest in the November elections was centered on the results as affecting the control of the 80th Congress which by an overwhelming majority passed to the Republican Party in the House of Representatives and by a safe majority in the Senate. The outcome came as no great surprise since the politically minded, as well as the rank and file of the voters, were aware that a widespread restlessness pervaded the atmosphere of the post-war period and that the inevitable repercussions of a devastating war of virtually worldwide scope made a change in the national political picture both probable and desirable on the theory that conditions could not be made worse by the change and might well be made better. In a sense, too, the time seemed ripe for final repudiation of what remained of the Rooseveltian New Deal. Also, the Democratic Party failed to present a completely united front for various reasons, among which may be cited the Third Term issue of five or six years past and the Communist-vote issue of the present.

---

* Grateful acknowledgment is hereby made to the Secretaries of State of the various states and to Mr. John Andrews, Clerk of the House of Representatives, whose cooperation has made the compilation of these statistics possible.

DIVISION II

INTERNATIONAL AFFAIRS AFFECTING THE UNITED STATES

THE UNITED NATIONS

By Winifred N. Hadsel
Research Associate, Foreign Policy Association

SECURITY COUNCIL

The year 1946 was one of intense activity on the part of the United Nations Security Council, the General Assembly, and their dependent committees and commissions, as they sought to perfect machinery that would preserve international harmony.

The Security Council during 1946, consisted, in addition to its five permanent members (United States, U.S.S.R., United Kingdom, China, and France), of Australia, Brazil, and Poland, elected by the General Assembly for two year terms, and the Netherlands, Egypt and Mexico, elected to serve one year. The Council convened in London on Jan. 17, and through the remainder of the year it was almost continuously involved with controversial issues relating to the maintenance of peace and security, as defined in Chapter VI of the United Nations Charter. No sooner was the Council established than it was called on to consider the charge that the Soviet Union was interfering in the internal affairs of Iran.

IRAN—SOVIET UNION

The dispute between the Soviet Union and Iran represented a new phase of an old struggle which had been going on between the two countries as a result of Russia's efforts to establish its influence in the northern Iranian provinces and to obtain oil concessions in this area. The Iranian government opposed Russian development of this region lest the U.S.S.R. should feel that exploitation of its oil resources would necessitate the fairly complete imposition of the Soviet economic system on northern Iran. The United States and Britain were also concerned by Russia's apparent efforts to gain Iranian concessions in return for the withdrawal of the Red Army troops, partly because of their own interest in the country's oil and partly because of their fear that the U.S.S.R. might attempt to gain political as well as economic control of this strategically important area of the Middle East.

During the Second World War the three great powers had harmonized their interests in Iran by means of an arrangement whereby American and British troops were stationed in the southern and central areas of the country while Red Army troops were based on the northern provinces. Following the end of the war, the United States evacuated all its military personnel, which had been connected with the Persian Gulf Command (Jan. 1, 1946), and the British ended their occupation by March 1, the date set for the withdrawal of Russian and British troops by the Anglo-Soviet-Iranian Treaty of Alliance of 1942. Red Army troops, however, remained in northern Iran after this date and showed signs of attempting to strengthen the local Communist-led Tudeh party in order to assure the establishment of a pro-Soviet regime after the withdrawal of the Russian forces.

The Iranian case was first brought before the Security Council Jan. 19, when the head of the Iranian delegation to the United Nations, Hassan Taquizadeh, stated that, owing to the interference of Soviet officials and armed forces in Iranian affairs, a situation had arisen which might lead to international friction. The Iranian representative accordingly requested the Executive Secretary, in accord with the terms of Article 35-1 of the Charter, to bring the matter to the attention of the Security Council in order that the Council might investigate the situation and recommend appropriate terms of settlement. The application was thereupon considered by the Council, with the Iranian representative participating in the discussion, and it was unanimously agreed (Jan. 30, 1946), that Russia and Iran, having indicated their willingness to seek a solution by negotiation, should resume discussion and inform the Council of any results which they might achieve. In the meantime the Council retained the right to request information at any time on the progress of the negotiations.

When negotiations failed to produce an agreement, the Iranian issue was again brought to the attention of the Security Council meeting at its temporary headquarters at Hunter College in the Bronx, New York City. The Iranian Ambassador to the United States, Hussein Ali, stated that the Soviet Union was maintaining Red Army troops in Iran after March 2, 1946, contrary to the express provisions of the Anglo-Soviet-Iranian Treaty, and that the U.S.S.R. was continuing to interfere in the internal affairs of Iran through the medium of Soviet agents, officials, and armed forces.

The question as to how the issues raised by the Iranian application should be settled was the subject of lengthy discussions by the Council. Andrei A. Gromyko, the Russian delegate on the Council, declared that the matter should be handled through the continuation of direct negotiations between Moscow and Teheran. The British and American delegates, on the other hand, insisted that the Security Council should hear Iran's case against the Soviet Union. When a majority of the Council supported the British and American view on March 27, M. Gromyko left the Council Chamber and remained absent 13 days, while the Council continued to discuss the Iranian case. The Russian action during the Council's consideration of its major international issue raised the question of the effectiveness of the Council if one of the great powers could frustrate the Council by refusing to attend its meetings.

This question was not directly answered by the Council, neither was it clearly determined how far the Council might be able to proceed in taking action against one of the great powers. On April 4, the Council resolved, during the absence of the Soviet delegate, to defer further proceedings on the Iranian appeal until May 6, at which time the Soviet and Iranian governments were requested to report to the Council on the withdrawal of Soviet troops from Iran. Two days later (April 6), the Soviet representative attempted to secure the removal of the Iranian question from the agenda of the Council, on the grounds that full evacuation of Soviet troops from Iran had begun on March 24 and would be completed in five or six weeks. The Soviet delegate also declared that an understanding on all points had been reached between the Soviet and Iranian governments on April 4. Included in this understanding was an agreement that Russia should secure oil concessions in northern Iran, subject to the ratification of the Iranian parliament. (Ratification had not taken place by the end of 1946.)

According to the Iranian Ambassador, however, the government of Iran desired that the question should remain on the agenda of the Council. When, a few days later, the Ambassador reported that his government had sent a telegram stating that it had complete confidence in the word of the Soviet Union and hence withdrew its complaint, a majority of the Council, including delegates of the United States and Britain, decided that this communication could not be accepted as the basis for a decision by the Council since the Iranian statement might be the result of Soviet pressure.

Despite repeated Russian demands that the Council drop the Iranian issue, the Council proceeded May 6 to call for the reports the Council had requested from both Moscow and Teheran on the withdrawal of Soviet troops from Iran. Moscow failed to send such a report, but the Iranian Ambassador presented a statement to the effect that investigations made by responsible Iranian officials showed that Soviet troops had been completely evacuated from several provinces. Because, however, of Russian interference, his government declared that it had been impossible to verify, by direct observation, reports that the evacuation of Red Army troops from Azerbaijan had been going forward. In view of this report that the Iranian government was unable to state, as of May 6, whether the withdrawal of all Soviet troops from Iran had been completed, the Security Council resolved to request the Iranian government for another report on May 20.

In this second report the Iranian Ambassador declared that his government was still unable to exercise any effective authority in the Province of Azerbaijan and that Soviet interference in the internal affairs of Iran had not ceased. Although telegraphic reports from the Iranian Prime Minister, Ahmad Ghavam, stated that Soviet troops had evacuated Azerbaijan on May 6, 1946, the Council decided, on May 22, to adjourn the Iranian question until a date in the near future, instead of removing it from the Council's agenda. In this way, the Council attempted to maintain pressure on Russia and to bring world opinion to bear on the Iranian case until the Soviet Union ceased its intervention.

Nevertheless, it was not until the closing months of 1946 that the Iranian government managed to restore its power in Azerbaijan. During November, the government massed troops on the frontier and announced to the pro-Soviet Azerbaijan Democratic party, which had grown out of the Tudeh party and controlled the province, of its determination to take the area by force if necessary. In reply the *de facto* Azerbaijan regime warned the Iranian army not to attack, and the Soviet Ambassador called upon the Iranian Premier to warn him that disorders might occur on the Soviet border if Iranian troops entered Azerbaijan.

When, however, the central government troops marched into Tabriz, the capital of Azerbaijan, Dec. 13, they met with little resistance, and Dec. 18 Premier Ghavam declared that he had dissolved the Azerbaijan Democratic party and liquidated the Soviet-sponsored provincial government. Russia, instead of attempting to support the Azerbaijan Democratic party, which had shown itself weak and highly unpopular, assailed its leaders for their failure to compromise with the central government. In broadcasts from Baku, Soviet spokesmen declared that the Azerbaijan leaders should have come to an agreement with the central government in order to make it possible for the pro-Soviet Democratic party to remain in existence. The important fact, however, seemed to be that Russia, realizing the inherent weakness of the pro-Soviet groups on which it had depended in Azerbaijan and conscious of the strong international opposition of its Iranian policy, had decided to withdraw from Iran. The Iranian government, despite its apparent victory in this particular phase of its long struggle with Russia, declared Dec. 18 that it had made no request to the Security Council to drop its complaint of Russian interference. Removal of the complaint from the agenda of the Council thus awaited the action of the great powers.

GREECE

A second issue before the Security Council, which directly concerned two of the major powers, was that of Greece. On Jan. 21, 1946, the Soviet delegate requested the Security Council to discuss the situation in Greece on the grounds that the presence of British troops in that country, following the termination of the war, constituted an interference in the internal affairs of Greece and caused tension fraught with grave consequences both for the Greek people and for the maintenance of peace and security.

This Russian charge highlighted the historic diplomatic dispute between Moscow and London over the eastern Mediterranean. Russia, for its part, apparently believed that, if British troops did not leave Greece before the elections, scheduled for March 31, a royalist government might be elected which would maintain Greece's alliance with Britain and deny Russia the strategic bases it felt it needed to protect its communications through the Dardanelles. Britain, on the other hand, feared that, if it withdrew its troops from Greece, civil war would again break out in that country. As a result of this strife, the British feared that Communist elements might establish a minority regime which would grant the Soviet Union strategic bases astride Britain's vulnerable Mediterranean Sea route to India.

After a heated discussion of the Greek question, in the course of which the British delegate, Foreign Secretary Ernest Bevin, demanded that the Security Council issue a formal declaration acquitting Britain of the Soviet charges, the Soviet Union and Britain reached a compromise. On Feb. 7, 1946 the Russian representative, Vice Commissar of Foreign Affairs Andrei Y. Vishinsky, agreed not to press his charge that British troops in Greece had created a situation threatening world peace and to withdraw his demand for action by the Council. Bevin in turn offered to retract his demand for a formal acquittal, and the Security Council thereupon agreed to consider the Greek question closed.

A few months later, Aug. 24, the issue of British troops in Greece was again presented to the Security Council when the Ukrainian SSR addressed a letter to the Council declaring that "as a result of the irresponsible policy of the Greek government (the royalist and pro-British regime which had been elected on March 31), a situation has arisen in the Balkans which represents a grave danger to peace and security." The Ukrainian letter referred particularly to the numerous border incidents along the Greek-Albanian frontier, which, the Ukrainian Foreign Minister charged, were "provoked by Greek armed units," and to persecution by the Greek government of national minorities in Macedonia, Thrace, and Epirus. The principal factor responsible for the situation in Greece and along its frontiers, he declared, was the presence of British troops in Greece and "the direct intervention of British military representatives into the internal affairs of this Allied country in behalf of aggressive Monarchist elements."

In a rapid and unexpected move, the United Kingdom and The Netherlands demanded, Aug. 28, that the Security Council refuse to consider the Ukrainian charges that Greece, with British aid, was creating a Balkan crisis until the accusations had been bolstered by concrete evidence. The imputed recent disorders in Greece, Sir Alexander Cadogan, the British delegate, and Vassil Dendramis, the Greek representative, declared, were owing to Communist pressure rather than to the presence of British forces. After a month of debate concerning these charges and counter-charges, the Council decided to dismiss the allegations made by the Ukrainian SSR.

The dismissal of these charges did not, however, end the Greek case. As open civil war broke out in Greece during the autumn and an increasing number of border difficulties occurred between Greece, on the one hand, and its pro-Soviet neighbors, Bulgaria, Yugoslavia, and Albania, on the other, the Greek government decided to approach the Council for assistance. On Nov. 26, Greece charged that 37 incidents had taken place along the Greek frontiers between Sept. 9 and Nov.

10. Responsibility for these incidents, the Greek letter implied, rested with Greece's northern neighbors. Premier Constantin Tsaldaris flew from Athens to Lake Success in order to bolster the Greek charge that "foreign sources" were inspiring and directing disorders and violence in northern Greece, for the purpose of partitioning Greece, and to ask the Council to take some measures to end the "tragic situation."

Several months before this request was made the acting American representative on the Council, Herschel V. Johnson, had proposed (Sept. 18) that a United Nations sub-committee be appointed to inquire into incidents occurring on Greece's entire northern frontier. At the time this proposal was made, no action was taken to implement it. Following the Greek request for action, however, the proposal for an investigation was revived, and at the end of December an 11-nation committee, composed of representatives of states belonging to the 1947 Security Council, was named to investigate the Greek situation and to report to the Council. (See "The United States and Europe.")

INDONESIA

In the case of Indonesia the Council was also requested to send a commission to carry out an inquiry on the spot, but the resolution to this effect was lost. On Jan. 21, 1946, the Ukrainian SSR representative drew the attention of the Council to the situation which had arisen in Indonesia as a result of clashes between the Indonesian nationalists and Dutch and British troops and alleged that it threatened international peace and security.

As the first step toward establishing peace in Indonesia, the Ukrainian representative declared, the Council should carry out an investigation. After a long discussion, however, the Ukrainian resolution failed to obtain the required number of votes, and the matter was closed.

SYRIA AND LEBANON

The Security Council helped to promote a settlement of a dispute between Syria and Lebanon, on the one hand, and France and Britain, on the other. These two small countries, which wished to secure an agreement for the removal of French and British troops from their territories and found themselves unable to secure such an arrangement, brought their case before the Security Council on Feb. 4. The Syrian and Lebanese delegations declared that their governments had expected that British and French troops, which had been stationed in their countries during the war, would be withdrawn immediately following cessation of hostilities with Germany and Japan. They pointed out, however, that a Franco-British agreement of Dec. 13, 1945, made the withdrawal of troops subject to conditions which Syria and Lebanon considered inconsistent with the spirit and letter of the United Nations Charter.

During the debate which ensued in the Council, an American resolution, expressing confidence that the British and French troops would be withdrawn as soon as practicable and that the parties involved would undertake negotiations to that end, was accepted by a majority of the Council. Russia, however, vetoed this proposal on the grounds that it was inadequate, with the result that the resolution was lost. Nevertheless, the representatives of France and Britain stated that their governments would give effect to the majority decision of the Council.

France reported to the Council, April 30, that, as far as Syria was concerned, the British and French governments had jointly made the arrangements necessary for the full evacuation of Syrian territory by April 30. In the case of Lebanon, France declared that the withdrawal of French troops as a whole could be completed by Aug. 31, and that the small remaining group would be recalled not later than Dec. 31. On May 1, the United Kingdom reported that all British troops would be withdrawn from Syria by April 30 and from Lebanon by June 30.

SPAIN

Spain became the subject of an international debate on April 17, when, at Poland's request, the Security Council began an extended discussion of whether the Franco regime constituted a threat to world peace. Urging the Council to direct all member states to break diplomatic relations with Spain, the Polish delegate, Dr. Oscar Lange, based his case on the following points: that the Franco regime was forced on the Spanish people by the Axis during the Second World War; that it had since created a state of international friction by mobilizing troops on the French frontier; and that it tolerated and "encouraged" numerous German military and scientific personnel in Spanish territory.

The crux of the argument raised by the Spanish case was whether, under the Charter, United Nations intervention on the grounds cited by Poland would be in order. Britain and The Netherlands took the position that the nature of the Franco regime was a matter of domestic concern, and, moreover, that the evidence adduced to prove Spain a source of international friction was too slender to justify collective United Nations action. Russia, on the other hand, took the view that the Charter positively authorized intervention by the United Nations when the internal situation of any country constituted a danger to international peace and security. Since the Franco government was a "breeding ground of Fascism," the Russian delegate declared, Spain's internal situation constituted such a danger.

As the debate on the Spanish case progressed it became clear that, however much the Western powers as well as Russia might wish to see Franco eliminated from the Spanish scene, the great powers were unable to agree on the kind of regime which should be established in Spain. The American delegate, Edward R. Stettinius, pointed out this obstacle to united action against Spain when he declared that, undesirable though the existing Spanish government was, a resumption of civil war in Spain would constitute a far greater threat to peace since it would almost surely have grave international repercussions.

At the suggestion of the Australian delegate, a sub-committee of five was appointed to determine whether the situation in Spain endangered international peace and security, and, if so, to propose practical measures that the United Nations could take. This sub-committee, composed of representatives of Australia, Brazil, China, France, and Poland, submitted a report on June 6 which declared that the activities of the Franco regime did not constitute an existing threat to peace and that the Security Council therefore had no authority to undertake any punitive measures against Spain. However, the sub-committee continued, since Spain constituted a "potential menace to international peace and security," the Security Council was empowered, under Article 36-1, to recommend appropriate steps to improve the situation. No suggested measures succeeded, however, in passing the Council because of the veto of the Russian delegate, who contended that the various proposals were inadequate to cope with the situation. Unable to break this impasse, the Council was able to agree only at the end of June that it remained seized of the Spanish question, and that in doing so it did not prejudice the right of the General Assembly to consider the matter.

TROOP COUNT CALLED FOR

A Soviet resolution to the effect that the Council should require all nations with troops on the soil of Allied countries to report on the number of armed forces involved was introduced at the end of August. On Sept. 24, however, the Council abruptly refused to consider this Soviet resolution, under which Britain and the United States would have been required to report the troops and military bases they were maintaining in Greece, China, and other non-enemy countries. This action on the part of the Council marked the first time it refused to consider a camplaint brought by a member government of the United Nations. Dr. Lange, the Polish delegate, protested the Council's action, declaring that it set a dangerous precedent whereby under certain conditions a member of the United Nations might be unable to approach the Council and secure a hearing. Dr. Eelco N. van Kleffens, representing The Netherlands, argued, on the other hand, that it was necessary for the Council not to admit all questions submitted automatically to the agenda, in order to protect members against "unwarranted charges."

ADMISSION OF NEW MEMBERS

Nine states applied for membership in the United Nations during 1946, and, Aug. 29, the Security Council admitted Afghanistan, Iceland, and Sweden, but rejected Albania, Ireland, Outer Mongolia, Portugal, and Trans-Jordan. The Soviet Union used its power of veto against the three British proteges—Ireland, Portugal, and Trans-Jordan—while Britain and the United States voted against Outer Mongolia and Albania, sponsored by Russia for membership.

Siam, which had also applied for membership during the summer, withdrew its request before the Council considered its application. Because of its border dispute with French Indo-China, which arose from the fact that Siam, with the support of Japan, had annexed four of Indo-China's border provinces in 1941, the Siamese government feared that its application for United Nations membership might be vetoed by the French. During the autumn, however, important progress was made toward the settlement of this border problem. Through the good offices of the United States, Siam and France agreed to the appointment of a conciliation commission, as provided by the Geneva Convention of 1927, to hear the recommendations of both France and Siam and to make proposals to the two governments concerning a permanent border. With these prospects for an amicable settlement with the French, Siam again applied for United Nations membership. and was formally admitted Dec. 16. Siam thus became the fifty-fifth member of the United Nations.

MILITARY STAFF COMMITTEE

On the assumption that the Security Council might one day be compelled to threaten or to take military action against a nation endangering world peace, Article 27 of the Charter provides that there should be established a Military Staff Committee to advise and assist the Council in this task. According to the Charter, this Committee should consist of the Chiefs of Staff of the permanent members of the Security Council or their representatives. In accord with this provision, the representatives of the Chiefs of Staff of China, France, USSR, United Kingdom, and United States met in London on Feb. 4, 1946, and established the Military Staff Committee. As its first action, the Committee drew up proposals on its organization and procedure and submitted them Feb. 16 to the Security Council for approval. The Council thereupon instructed its Committee of Experts to examine this report, but the Committee, owing to its preoccupation with procedural rules of the Council and other urgent matters, found itself obliged to postpone consideration of the proposals. Through the year, however, the Military Staff Committee, which resumed sessions in New York March 25 and functioned continuously through the remainder of the year, operated on the basis of provisional rules of procedure, and there was no indication that lack of permanent rules hindered its work in any way. By September, all of the Big Five submitted recommendations for the basic principles to govern formation of the United Nations military force, and although committee discussions were kept secret, it was unofficially reported that the powers reached general agreement that the United Nations could command an effective military force only if the Big Five pledged specific contingents that would be available should the Security Council require them.

ATOMIC ENERGY COMMISSION

Another important body responsible to the Security Council is the Atomic Energy Commission. By adopting the atomic energy resolution agreed on by the Big Three in Moscow, Dec. 24, 1945, the General Assembly set up the Atomic Energy Commission in London, Jan. 24, 1946, and made it responsible to the Security Council. Composed of representatives of the 11 members of the Council and Canada, the Commission was authorized to investigate all matters relating to atomic energy and to make specific proposals for (1) exchanging basic scientific information for peaceful uses, (2) controlling atomic energy to the extent necessary to insure its peaceful use, (3) eliminating atomic weapons as instruments of war, and (4) effectively protecting complying states against violations and evasions by inspection and other means.

There was delay before the 12 nations selected their delegates to the Commission, and the group did not convene until June 14 at Hunter College in the Bronx. At that session, Bernard M. Baruch, the American representative, outlined the position of the United States. The United States, he declared, would agree to destroy its atomic bombs or turn them over to an atomic development authority, together with its technical secrets, but only after "an adequate system for the control of atomic energy, including the renunciation of the bomb as a weapon, has been agreed upon and put into effective operation and punishments set up for the violations of the rules of control." He also made it clear that his plan ruled out the use of the veto by the Big Five in atomic energy decisions.

At the Commission's second meeting, June 19, Andrei A. Gromyko, the Soviet delegate, in opposition to the American proposal, presented a plan which would outlaw the atomic bomb by international agreement. The whole subject was to be kept under the Security Council, the veto would very definitely remain in force, and international inspection was not mentioned.

Plenary meetings of the Commission were rare from that time on, but committees carried on its work. A scientific and technical panel, composed of the world's leading physicists, examined the international aspects of the question and submitted a report to the Commission Sept. 28, warning that, unless appropriate safeguards were taken at each stage in the production of atomic material, it would be difficult to prevent its diversion for purposes of war.

After months of hearings it appeared that the Commission was still far from agreement on its recommendations, and the General Assembly therefore undertook to speed the work of the Commission by resolving that the Security Council should proceed with rapidity on the problem of controlling atomic energy. Thereupon, the Commission undertook consideration of proposals the United States submitted Dec. 5, and on Dec. 20 put these suggestions to a vote and adopted them 10 to 0, with Russia abstaining.

The resolution adopted by the Atomic Energy Commission embodied the following propositions: (1) There should be a strong and comprehensive international system for the control and inspection of atomic energy. (2) Such a system should be established by a treaty or convention, which would become operative only after those members of the United Nations, whose cooperation was essential to the success of the agreement, bound themselves to support it. (3) The treaty should include provisions for: (a) an international authority with power to carry out the provisions of the treaty; (b) no government would have the right to veto the authority's efforts to carry out its obligations or to obstruct inspection; (c) the authority would have charge of research and development of atomic energy for peacetime purposes; (d) the authority would have the right to inspect all installations for the production of atomic energy, to dispose of atomic bombs, and to carry out all other functions in connection with the control of atomic energy.

Despite its adoption of this set of principles for the consideration of the

Security Council, the Commission had actually taken only a small step toward solving the broad problems posed by atomic energy. For, as long as the United States and Russia continued to hold opposite views on the control of atomic energy, no plan, regardless of how technically perfect it might be, seemed to have any chance of succeeding in removing the atomic threat.

THE GENERAL ASSEMBLY

The inaugural meeting of the General Assembly, in which each of the United Nations holds one vote and no member has the right of veto, was held in London Jan. 10-Feb. 14, 1946. and dealt primarily with problems of organization. As its President, the Assembly elected the Belgian Foreign Minister Paul-Henri Spaak, and shortly thereafter it created six main committees to consider substantive items appearing on the agenda of the Assembly. Among the other important administrative decisions the Assembly made in connection with its task of organizing the United Nations into an effective working machine were the choice of New York as the interim headquarters for the United Nations, and the election of Trygve Lie of Norway, who had the support of Russia, as the United Nations Secretary-General. Under the Charter, the Secretary-General holds extraordinary powers but he has thus far asserted them warily. In addition to Lie's own staff, there were approximately 2,000 persons on the United Nations payroll during 1946, and they were divided, under eight assistant secretaries-general, into eight departments.

The first meeting of the General Assembly in the United States was held at the Assembly's temporary headquarters in Flushing, Long Island, from Oct. 23 to Dec. 15. The session was a remarkably active one, and during the course of its meetings resolutions were passed on 73 subjects which ranged from matters of great importance to organizational details. The most significant achievements of the Assembly may be summarized as follows:

DISARMAMENT

In the first step taken by any international authority toward world disarmament, the Assembly unanimously adopted a resolution declaring the necessity of an early general regulation and reduction of armaments and armed forces. This proposal was originally made by the Soviet delegation during the early days of the session. As finally adopted by the Assembly Dec. 14, the resolution recommended that the Security Council give prompt consideration to the formulation of practical measures needed to bring about the reduction and regulation of armaments and armed forces and to assure that such regulation would be observed by all participants. After formulating these plans, the Security Council was instructed to submit them to a special session of the Assembly, which in turn would present them to the signatory states for ratification.

The core of this significant decision of the Assembly was the provision that the international system of inspection and control shall be "within the framework" of the Security Council, as urged by Russia, but that the special organs required shall derive their powers and status from the conventions establishing them, as suggested by Australia and Canada. According to Secretary of State Byrnes' statement to the Assembly Dec. 13, the United States recognizes that the veto right on the Security Council applies to the drafting of these conventions. The United States hopes, however, that these conventions will not include the veto power in the international system of inspection and control.

In order to make sure that disarmament would be directed toward the major weapons of modern warfare, the disarmament recommendation further provided that the Security Council should expedite consideration of the work of the Atomic Energy Commission on conventions, including the prohibition of atomic and other major weapons adaptable to mass destruction.

QUESTION OF THE VETO BY THE GREAT POWERS

The Assembly debated at length the controversial subject of the great powers' right of veto in the Security Council. (As provided in Article 27 of the Charter, the decisions of the Security Council on all but procedural matters must be made by an affirmative vote of seven members, including the concurring votes of the permanent members.) In a resolution adopted Dec. 13 by a vote of 36 to 6, with 11 abstentions, the Assembly earnestly requested the great powers to use their special voting privilege in such a way as not to impede the Council from reaching decisions promptly. The Assembly refrained, however, from censuring past use of the veto, as had been proposed by Australia.

RELATIONS WITH SPAIN

When the Assembly turned to the subject of Spain, upon which the Security Council had been unable to reach agreement it proved that it was prepared to intervene in Spanish internal affairs to a somewhat greater extent than the Council had been. Noting that the Franco government had been imposed by force on the Spanish people with the aid of the Axis powers, the Assembly recommended that Spain be debarred from membership in international agencies established by the United Nations until it formed a new and acceptable government. The Assembly further recommended that, if within a reasonable time Spain failed to establish a freely chosen and representative regime, the Security Council should consider measures which could be taken to remedy this situation. Most important, the Assembly recommended that all members of the United Nations should immediately recall from Madrid their ambassadors and ministers and that the members should report to the Secretary-General what action they had taken in this regard.

RELIEF

In the controversial fields of relief and refugees the Assembly proved unable to reconcile the divergencies of views between East and West. In spite of opposition by Russia and other countries receiving relief from UNRRA, which was scheduled to terminate its activities at the end of 1946, the Assembly accepted the arguments of the United States. This country, which had furnished 72 per cent of UNRRA funds, opposed the creation of a new international agency for the completion of remaining relief tasks and insisted that henceforth nations requiring special aid should negotiate directly with the countries capable of supplying it. Under these conditions the Assembly merely recommended that the food-producing countries take certain measures to increase grain output, to improve transportation facilities for cereals and other basic foodstuffs, and to increase exports to countries suffering from food shortages. Industrial countries were likewise urged to help food-producing areas by supplying them with agricultural equipment and by facilitating the construction in undeveloped countries of small factories and workshops for the manufacture and repair of essential farming equipment. The Secretariat of the UN was also designated as a clearing-house for informal consultations on existing relief needs and available supplies, and a ten-nation technical committee was named to assess the world food situation.

INTERNATIONAL REFUGEE ORGANIZATION

To provide a solution to the problem of the hundreds of thousands of refugees and displaced persons still remaining in the British and American zones of Germany, the Assembly approved a constitution for a temporary specialized United Nations agency to be known as the International Refugee Organization. The debates leading to acceptance of a constitution for the IRO were long and arduous, and the constitution was finally adopted by a vote of 30 to 5, with 18 abstentions. Russia, the Byelorrussian SSR, Poland, the Ukrainian SSR, and Yugoslavia attacked the proposed constitution on the grounds that "refugees" and "displaced persons" who refused to return to various eastern European countries because they did not like the Leftist governments in those states did not deserve international aid. These countries of origin also argued that their reconstruction was being hindered by a shortage of labor and that they therefore had the right to prevent their citizens from expatriating themselves. The Western powers, on the other hand, felt that no refugee or displaced person should be compelled to return to his country of origin if he expressed valid objections to returning. These states accordingly insisted that the IRO should provide for resettlement as well as repatriation. It was evident, however, that the determined opposition of Russia and some of its neighbors to the proposed resettlement of persons who refused to return to their old homes might prove a stumbling-block to the work of the IRO.

INDIAN PROBLEM IN THE UNION OF SOUTH AFRICA

In one of its most important actions the Assembly, by a two-thirds majority, criticized the Union of South Africa's policies of discrimination toward its Indian population and declared that the "treatment of Indians in the Union should be in conformity with the international obligations under the agreements concluded between the two Governments and the relevant provisions of the Charter." The Assembly also requested that the two governments report to it upon the measures they had adopted to this effect.

The Assembly's decision to condemn racial discrimination against the Indians in South Africa represented a victory for the point of view advanced by India that the failure on the part of a given country to accord fundamental human rights and freedoms to its foreign population creates international tension and thus is a matter of concern to the United Nations. In this particular case, as India pointed out, South Africa's treatment of its Indian minority had provoked retaliation by India, with the result that relations between the two countries had been completely broken. South Africa, on the other hand, unsuccessfully maintained that the question of proper treatment for its Indian minority was exclusively within her domestic jurisdiction and that the Assembly was therefore not competent to deal with it.

PERMANENT UN SITE IN NEW YORK

The General Assembly also made numerous important organizational arrangements for the United Nations. Among these arrangements, that of determining the permanent location of United Nations headquarters was one of the most notable. On Dec. 14, the Assembly voted in favor of accepting the site in New York, valued at $8,500,000 and including approximately 17 acres on the East River, which John D. Rockefeller offered to the United Nations as a gift. This decision brought to a close months of search for a permanent site during which representatives of the United Nations travelled thousands of miles in the United States to report on a number of recommended locations which included San Francisco, Philadelphia, Westchester County of New York State, Long Island, and Boston.

TRUSTEESHIP COUNCIL

The Trusteeship Council, last of the main organs of the United Nations to be established, was set up by the General Assembly following its acceptance of eight trusteeship agreements covering as many former League mandates. Since these and other areas most frequently mentioned as possible "trust territories" included areas of great economic and strategic importance, the entire subject of trusteeship formed one of the most delicate questions considered by the Assembly.

The first category of territories which entered into the Assembly's discussions of the trusteeship system was that of the former German colonies which had been converted into mandates and held by various Allied powers following the First World War. With the exception of South Africa, the nations holding these territories submitted to the Assembly trusteeship agreements whereby the mandatory power became the administering authority. The nations which thus transformed their former mandates into "trust territories" were Great Britain (British Cameroons, British Togoland, and Tanganyika), France (French Cameroons and French Togoland), Belgium (Ruanda-Urundi), New Zealand (Western Samoa), and Australia (New Guinea).

The only mandatory power which refused to submit a trusteeship agreement was the Union of South Africa, which declared its intention to annex the mandate of Southwest Africa. Although the Assembly found that it had no power whereby it could force South Africa to reconsider its position, it did express itself almost unanimously against annexation and recommended that the government in Johannesburg submit a trusteeship agreement covering Southwest Africa.

The second group of territories discussed in connection with the establishment of the trusteeship system comprised the Pacific islands which had been mandated to Japan after the First World War and were at the time occupied by American forces. The original position of the United States in connection with these islands, which included the Marianas, Marshalls, and Carolines, was that they were "strategic areas," and hence should be placed under the jurisdiction of the Security Council, in which the United States had the power of veto. In order, however, to advance the Assembly's work on the trusteeship problem, the United States finally gave an implied pledge to consider placing at least some of the islands under the Trusteeship Council.

In the third category of territories connected with the establishment of the truteeship system were the former Italian colonies in Africa—Libya, Eritrea, Italian Somaliland—which were currently occupied by Britain. Under the terms of the peace treaty which the Allies negotiated with Italy in 1946, these colonies were to remain under British control until a year after the date the peace settlement becomes effective. At that time the Big Four are to make a final disposition of the colonies, and if they should be unable to reach an agreement within one year, the question of the ultimate disposal will be decided by the United Nations General Assembly, with advance concurrence by the Big Four.

Although the number of territories actually placed under trusteeship was smaller than had originally been hoped, the Assembly proceeded to establish a Trusteeship Council to administer the new "trust territories." The members of the Council, which was instructed to hold its first meeting not later than March 15, 1947, included the states administering trust territories—Australia, Belgium, France, New Zealand, and the United Kingdom. Other permanent members of the Security Council were the United States, USSR, and China. The countries elected by the General Assembly for three years to balance the administering and non-administering powers on the Trusteeship Council were Iraq and Mexico.

Although Russia voted against the trusteeship agreements submitted to the General Assembly on the grounds that all members of the Security Council and Trusteeship Council, rather than the mandatory power, had the right to determine the terms of trusteeship, it became, by virtue of its position as a permanent member of the Security Council a member of the Trusteeship Council.

The objectives of the new Trusteeship Council were "to further international peace and security, to promote the political, economic, social and educational advancement of the inhabitants of the trust territories," and to help them to their ultimate independence, as well as to encourage respect for human rights. To achieve these goals the Council was empowered to ask for periodic reports from the administering authority; to accept petitions and examine them in consultation with the administering authority; and to send out inspectors to the territories at times agreed upon with the administering authority. In this last respect, the Trusteeship Council was granted power that the old League of Nations Mandates Commission had not possessed. However, except for the fact that all members of the United Nations are committed to the goals laid down in the Charter, the Council has no power to enforce compliance with its standards for "trust territories."

NON-SELF-GOVERNING TERRITORIES

The Assembly also discussed measures to implement the Charter's provisions relating to non-self-governing territories which were not placed under trusteeship. The Charter's provision that members responsible for administering these territories shall send to the Secretary-General regular reports on the economic, social, and educational conditions in the territories. was the subject of debate within the Assembly. In general, the representatives of countries administering non-self-governing territories held that the Secretary-General should merely summarize, analyze, and classify this information and include it in a report to the Assembly, which could then determine what action, if any, should be taken by the United Nations. Other members, however, contended that an *ad hoc* committee should be established to review the Secretary-General's summary and analysis, with a view to aiding the Assembly in its examination of the information, and this view prevailed. As a result, the Assembly established a committee to be composed of those countries scheduled to submit information on non-self-governing territories — Australia, Belgium, Denmark, France, the Netherlands, New Zealand, United Kingdom, and the United States—and an equal number of other states elected by the Assembly—Brazil, China, Cuba, Egypt, India, Philippines, the USSR and Uruguay.

THE ECONOMIC AND SOCIAL COUNCIL AND UNITED NATIONS SPECIALIZED AGENCIES

The Economic and Social Council, which is under the authority of the General Assembly and is charged with facilitating the work of the United Nations in the realm of the broad social and economic objectives stated in the Charter, held three sessions during 1946 and made numerous studies and recommendations to the Assembly. Like other United Nations organs, the Economic and Social Council found it difficult to implement agreements on social and economic subjects without infringing upon the sovereignty of the individual member states. Nevertheless, the Council succeeded in drafting constitutions for the proposed World Health Organization, the International Refugee Organization, and the International Trade Organization. In order to coordinate the activities of specialized agencies already in existence, the Council also conducted negotiations for bringing the ILO (International Labor Office), UNESCO (United Nations Educational, Scientific and Cultural Organization), PICAO (Provisional International Civil Aviation Organization), and FAO (Food and Agriculture Organization) into a formal relationship with the General Assembly. Moreover, as the only organ of the United Nations authorized to cooperate with non-governmental national and international organizations concerned with economic and social problems, the Council provided for close cooperation with the World Federation of Trade Unions, International Cooperative Alliance, American Federation of Labor, and International Chamber of Commerce by giving these bodies consultative status.

FIRST CONFERENCE OF UNESCO

The United Nations Educational, Scientific and Cultural Organization, designed by the Charter to foster international intellectual cooperation, was established by a conference in London in November 1945, in which 41 nations participated. A detailed program was drawn up at that time and permanent headquarters were set up in Paris in 1946.

Among the aims of UNESCO are the promotion of international agreements for the free exchange of information and ideas throughout the world, and assisting members, at their request, in developing educational activities; the institution of collaboration among nations to advance equality of educational opportunity; and the assuring of the conservation and production of the world's inheritance of books, works of art, and the monuments of history and science.

At the first general conference of UNESCO, held in Paris during November and December, the view was adopted that the organization's projects should be highly practical and few in number at the beginning in order not to overtax its 1947 operating budget of $6,000,000. Among the major problems which UNESCO agreed to begin to tackle at once were illiteracy and the establishment of world-wide minimum standards of education; the barriers that now obstruct the free flow of communications among nations; and the lack of world-wide broadcasting facilities under international auspices. An international broadcasting network, members of UNESCO hoped, might bring to people everywhere an account of the history, achievements, problems, and hopes of other peoples. A somewhat different kind of enterprise was that proposed in connection with the International Institute of the Amazon. This organization was conceived by UNESCO as a means of bringing together scientists from many nations and fields of science to study the problems of food, disease, and natural resources of a specific area in order to bring their knowledge to bear upon the malnutrition and backwardness which have characterized the tropical regions of the world.

FAO AND PROPOSED WORLD FOOD BOARD

The established aims of the Food and Agriculture Organization, which was organized at Hot Springs, Virginia, in May 1943, as a permanent United Nations agency, are to raise the levels of nutrition in the world, improve the efficiency of production and distribution, and improve the condition of rural populations. In an attempt to set up a long-range program for sharing the food of the world's productive nations with countries which suffer periodically from droughts, floods, or economic dislocations, the annual FAO Conference, which met at Copenhagen in September 1946, discussed the formation of a World Food Board to maintain a world food reserve. During the remainder of the autumn a Preparatory Commission on World Food Proposals studied the possibilities of establishing such a Board, and it had not completed its work by the end of the year. It was clear, however, before a World Food Board could be established, that a balance would have to be struck between those nations, such as Britain, which expressed confidence in national and international economic planning, and those countries, led by the United States, which emphasized national enlightenment rather than planning as a means for achieving an expanded and stable level of world food production.

ILO AND THE UNITED NATIONS

Created at the Paris Peace Conference in 1919 and inherited from the League of Nations, the International Labor Organization made a formal agreement with the United Nations during 1946 whereby its work was integrated with that of the Economic and Social Council. Though government-sponsored, the national delegations to the ILO include representatives not only of government but of management and organized labor. Its purpose is to promote social justice in the world, and to this end it concludes international agreements with national governments. While not all proposed ILO agreements have been ratified and fewer have been scrupulously observed, it is generally conceded that the ILO is having at least some influence in improving working conditions.

TECHNICAL WORK OF PICAO

The Provisional International Civil Aviation Organization, which was formed by representatives of 54 nations who met in Chicago in November 1944, continued during 1946 to draft programs for unifying the different and confusing aviation procedures maintained by various countries. This highly technical work was carried on by experts at a series of conferences in Washington, Cairo, and Montreal.

WORLD BANK

Established at the Bretton Woods Conference in July 1944 and supported by all the Big Four powers except the Soviet Union, the International Bank for Reconstruction and Development was created for the purpose of making loans to nations for post-war reconstruction and the development of member countries. Not designed to compete with private bankers, the Bank, which has a total potential capital of $8,000,000,000, is intended to make loans only where private bankers feel themselves unable to assume the risk involved. The process of recruiting personnel for the Bank proceeded slowly during 1946, with the result that the Bank was as yet not prepared to handle loan applications. Moreover, with the resignation of the Bank's president, Eugene Meyer, in November, the prospects for speedy action by the Bank were further reduced. However, it is generally agreed that the real test of the Bank will come when the institution is obliged to determine whether political considerations should be permitted to enter into its decisions on petitions for loans.

WORLD COURT

The International Court of Justice, successor to the League of Nations' Permanent Court of International Justice, was formally opened April 18, 1946. The 15-judge court, whose members were elected Feb. 6, 1946 in concurrent voting by the General Assembly and the Security Council, is headed by Dr. José Gustavo Guerrero of El Salvador, and is seated at The Hague. The countries represented on the Court for nine-year terms are Brazil, Chile, El Salvador, France, and Great Britain; for six-year terms, Belgium, Mexico, Norway, Soviet Union and United States; for three-year terms, Canada, China, Egypt, Poland, and Yugoslavia. The Court has thus far heard no cases. Most of its time during 1946 was given over to evolving rules of procedure and choosing its Secretariat.

THE OUTLOOK

The experience of the United Nations during its first year of activity indicated that the future of the elaborate organization depended primarily upon the success of American, British, and Russian diplomacy in reaching some kind of working agreement. It was clear at the end of 1946 that at best the United Nations will eventually serve as a vehicle which can be used by the great powers to achieve unity among themselves, but at worst it is likely to serve as a rallying point against any nation or group of nations that consistently defies its principles and attempts to make war on the world.

How effective the organization will be in dealing with political disputes among the great powers depends largely on the willingness of all the powers to back up the principles of the United Nations Charter, in and out of the United Nations agencies, and with or without the veto. If they all demonstrate that they are not going to permit any technicalities of the Charter to relieve them of their agreement to support the principles and purposes of the Charter, then the United Nations organization can work as a brake on any aggressor, large or small, even if a great power attempts to cast a veto in its own defense.

THE UNITED STATES AND THE PEACE TREATIES

By Winifred N. Hadsel
Research Associate, Foreign Policy Association

PEACE SETTLEMENTS WITH AXIS SATELLITE STATES

At the three sessions of the Council of Foreign Ministers and the general Peace Conference of 21 nations which were held during 1946, Secretary of State James F. Byrnes continued to press for the speedy conclusion of peace settlements with the five former Axis satellite states, and on Dec. 12, 1946, the treaties were finally completed. Secretary Byrnes, on the eve of his resignation as Secretary of State, signed the treaties with Rumania, Bulgaria, Hungary, and Italy for the United States (Jan. 20, 1947). Since the United States had not been at war with Finland, he did not sign the treaty the Council of Foreign Ministers had prepared for that country. The date for the final signature of the treaties by all the Allies and the five former enemy states was set for Feb. 10, 1947, in Paris.

The procedure whereby the peace treaties with the minor Axis powers were drawn up was outlined at the Potsdam Conference of the Big Three during August 1945, 19 months before the date of the final signing of the agreements. According to the instructions issued at Potsdam, the Council of Foreign Ministers, representing the United States, Britain, Russia, France, and China, were "to continue the necessary preparatory work for the peace settlements and to take up other matters which may from time to time be referred to the Council by agreement of the governments participating in the Council."

DEADLOCK OVER PROCEDURAL ISSUES

The first session of the Council of Foreign Ministers, which was held in London, Sept. 11–Oct. 2, 1945, broke down over procedural issues, and no discussion of the peace treaties themselves took place at that time. The Soviet delegation took the view that the "preparatory and exploratory" work of the Council should be restricted to the signatories of the surrender terms in question. According to this interpretation, China and France, whose representatives were present in London in accordance with the Potsdam agreement, would not be permitted to take part in the negotiations. The only exception Soviet Foreign Minister Molotov was prepared to make was that France might be permitted to consider the terms of the treaty with Italy. Secretary Byrnes, on the other hand, maintained that the Potsdam agreements "contemplated a broadening out of the participants before the final conclusion of a peace treaty," and he therefore proposed that France and China be asked to accept Russia's position, provided the Soviet Union agreed to the convocation of a broadly representative peace conference before the end of 1945.

It was the opinion of the United States, Secretary Byrnes declared, that "in an interdependent, democratic world, peace can not be the exclusive concern of a few presently powerful states; that, unless we were to revert to a world of isolationism none of the states which we wanted invited to the peace conference could be said to be not directly concerned in the peace. We urged that those states, both large and small, which had fought and suffered in the war must make the peace. This has been a peoples' war and it must be a peoples' peace." In reply to this American plea for a general peace conference the Soviet delegation declared that it could not agree to the proposal until M. Molotov and his aides had returned to Moscow and consulted Premier Stalin.

The question as to which nations

should participate in drafting the treaties was settled during a meeting of the Foreign Ministers of the United States, Britain, and Russia in Moscow, Dec. 16-25, 1945. At that conference the Soviet view that only members of the Council of Foreign Ministers who were signatories of the armistice terms with the five former satellite states should participate in drawing up the peace treaties, prevailed. This meant that the terms of the peace treaty with Italy were to be drafted by the United States, Russia, Britain, and France. The terms of the peace treaties with Rumania, Bulgaria, and Hungary were to be drawn up by the United States, Britain, and Russia, while the terms of the treaty with Finland were to be settled by Britain and Russia, since the United States had not declared war on Finland and hence had not signed an armistice treaty with that country.

As a concession to the American and British points of view on peacemaking procedure, Russia agreed that the Council might "invite other members of the Council to participate on questions directly concerning them." Of greater importance, however, was Russia's acceptance of Secretary Byrnes' recommendation that a conference for the purpose of considering the drafts proposed by the Council of Foreign Ministers be called not later than May 1, 1946, this conference to consist not only of the five members of the Council of Foreign Ministers, but include "all members of the United Nations which actively waged war with substantial military force against European enemy states." These nations were listed as follows: Australia, Belgium, Byelo-russian SSR, Brazil, Canada, Czechoslovakia, Ethiopia, Greece, India, the Netherlands, New Zealand, Norway, Poland, Union of South Africa, Yugoslavia, and Ukranian SSR.

DRAFTING THE PEACE TREATIES

Once basic procedural questions were settled, the drafting of the peace treaties could begin. However, when the deputies of the Foreign Ministers met in London during January 1946, to begin preliminary work on the treaties, they were able to reach only a few decisions on minor points. Little progress was made on such controversial issues as the future of Trieste, control of the Danube, disposal of the Italian colonies, and reparations.

The second session of the Council of Foreign Ministers, which met in Paris April 25–May 16, 1946, also found itself unable to agree either upon the leading issues arising in connection with the treaties or upon the date of the general peace conference, whose summoning was opposed by M. Molotov until agreement had been reached by the Big Four on "fundamental questions." As a result of these delays, Secretary Byrnes warned, in a radio report to the American public on the work of the conference, that the United States might have to adopt a new course of action. "When a world short of goods and short of food is crying for the return of conditions of peace," he declared, "we can not indefinitely delay the making of peace and the withdrawal of troops from occupied areas. The four Allied governments can not indefinitely delay the making of peace with countries which they have long ceased to fight, simply because they can not agree among themselves on peace terms."

In order to assure the speedy conclusion of the peace treaties, Byrnes stated that "the United States will feel obliged to request the General Assembly of the United Nations under Article 14 of the Charter to make recommendations with respect to the peace settlements" if a peace conference were not called during the summer of 1946. (Article 14 of the United Nations Charter provides: "Subject to the provisions of Article 12, the General Assembly may recommend measures for the peaceful adjustment of any situation, regardless of origin, which it deems likely to impair the general welfare or friendly relations among nations, including situations resulting from a violation of the provisions of the present Charter setting forth the purposes and principles of the United Nations.") Byrnes added, however, that he hoped it would be unnecessary for the United States to request the United Nations Assembly to take action on the peace treaties, and he expressed confidence that the peace conference would be held soon.

At the third session of the Council of Foreign Ministers, held in Paris June 15–July 12, 1946, agreement was reached upon a number of the controversial questions posed by the peace treaties, and on July 4 France, as the inviting power, was authorized to send invitations to the general Peace Conference. Before this session of the Council ended, however, M. Molotov insisted upon a point which, it seemed for a time, might lead to another period of extended debate among the great powers. He declared that the general Conference should follow rules drawn up by the Council of Foreign Ministers rather than those which it might formulate for itself. The Soviet Union thus indicated its concern lest the small nations invited to the Conference fundamentally change the arrangements tentatively agreed upon by the Big Four Foreign Ministers. The United States and Britain, on the other hand, hoped to give the smaller states a real voice in the making of the treaties, and they were disturbed by the Russian effort to curb the Conference even before it was convened.

According to the rules of procedure for the general Peace Conference, as agreed upon by the Big Four, July 8, 1946, a two-thirds majority was required on all major questions upon which the Council of Foreign Ministers had not already agreed, and a simple majority on matters of procedure. However, these rules did not make it entirely clear how much weight a decision of two-thirds of the Conference would have in determining the final action of the Foreign Ministers.

At the beginning of the Paris Conference (July 29–October 15, 1946) Paul-Henri Spaak of Belgium proposed that the Big Four should agree to be bound by any recommendations the Conference adopted by a two-thirds majority, even if these recommendations upset previous decisions of the Big Four. The adoption of this suggestion would have enabled a two-thirds majority of the Conference, rather than the Council of Foreign Ministers, to write important sections of the five peace treaties under consideration.

Secretary Byrnes immediately welcomed the Belgian suggestion and urged its acceptance as a means of permitting the 17 smaller countries present at the Conference to take an active part in arranging the peace settlement. M. Molotov, however, objected to the proposal, and successfully contended that the final responsibility for the drafting of all portions of the treaties must rest with the Big Four. Thus ended an effort on the part of the smaller powers, supported by the United States, to give the Paris Conference more than merely advisory functions. Thereafter the smaller nations could only hope that the Big Four might voluntarily heed the recommendations of the Conference, especially when they were made by a two-thirds majority and upon points which had not been previously agreed upon by the Council of Foreign Ministers.

The sessions of the Paris Peace Conference were held against a background of tension between Russia and the Western powers. While the delegates in the Luxembourg Palace were discussing the terms of peace with the former Axis satellites, they were constantly reminded by a series of controversies and incidents of the sharp differences between East and West. During the period the Conference was in session the United States and Russia expressed disagreement over such important issues as Germany, the Dardanelles, and foreign trading policies. Yugoslav attacks on American airplanes also embittered relations between the United States and the pro-Soviet regime in Belgrade. Closely linked with the Conference, moreover, was the Wallace–Byrnes controversy over the conduct of American foreign policy. (See "United States and Europe.")

As required by the rules laid down by the Big Four, the Paris Conference referred its recommendations to the Council of Foreign Ministers, which met Nov. 4–Dec. 12, 1946 in New York City. At this, the fourth session of the Council, the final drafting of the peace treaties was completed.

POSITIONS OF THE GREAT POWERS ON TRIESTE

The ancient and picturesque Adriatic port of Trieste, which had been under Austrian rule for 500 years before the First World War, except for a brief period in the Napoleonic era, and ceded to Italy in 1919, presented the most tangled of all the peacemaking issues. Not only was there a violent Italo-Yugoslav conflict over Trieste and Venezia Giulia, but there was bitter rivalry between Russia and the Western powers for control of this strategically important area. The Soviet Union, hoping to secure an outlet to the Mediterranean by way of the Adriatic Sea, supported Yugoslavia's claims to the port of Trieste and its hinterland. Britain and the United States, on the other hand, were unwilling to permit Russia to gain a key position on the Adriatic, and they accordingly supported Italy's claim Under these conditions it was hardly surprising that the four-power commission of experts which visited the disputed area during the spring of 1946 to investigate the Italo-Yugoslav frontier question failed to agree and instead proposed four different boundary lines.

The Russian members of the commission took the view that Venezia Giulia should be treated as an inseparable whole, in which case the Yugoslav population would unquestionably outnumber the Italian population. The representatives of the United States, Britain, and France contended, on the other hand, that the area should be divided in such a way as to leave a minimum of the smallest possible number of either Italians or Yugoslavs under alien rule. The American delegation further proposed that a plebiscite should determine the fate of the area lying between the two boundary lines suggested by the United States and the USSR. However, M. Molotov refused to hold a plebiscite unless it was applied to the entire area of Venezia Giulia.

At the third session of the Council of Foreign Ministers a compromise was finally reached whereby all territory east of a boundary line which the French had proposed would be ceded by Italy to Yugoslavia. According to this arrangement, approximately 3,000 square miles of territory, including the Izonzo Valley, Istria, and the ports of Pola and Fiume were to be ceded to Yugoslavia. The port of Trieste and its immediate hinterland, estimated at 300 square miles, were to form "The Free Territory of Trieste."

The Yugoslav representatives at the Paris Peace Conference attempted to secure a revision of this proposed Italo-Yugoslav frontier, and at the fourth session of the Council of Foreign Ministers in New York the representatives of both Yugoslavia and Italy sought support for their conflicting points of view. The Big Four nevertheless adhered to the "French line," and this boundary was accordingly written into the Italian peace treaty.

The willingness of both Russia and the Western powers to agree to the "French line" between Italy and Yugoslavia depended upon the attainment of a mutually satisfactory arrangement for the administration of the Free Territory of Trieste. Britain and the United States pressed for the administration of the area by a United Nations governor with strong powers, subject to the direction of the Security Council rather than to that of a popularly elected Trieste Assembly. In this way the Western Allies hoped to prevent a local contest for power between pro-Yugoslav and pro-Italian forces which might lead to the establishment of Yugoslav control over the port. Conversely, Russia wished to have the

Free Territory administered by a governor who would be responsible to a popular Assembly elected in the Free Territory and who would merely report to the United Nations Security Council.

At the Paris Conference the position of Britain and the United States on the question of how the Free Territory of Trieste should be administered was upheld by a vote of 15 to 6. However, at the ensuing session of the Council of Foreign Ministers, a compromise was worked out between the Soviet and Western points of view. According to this arrangement the governor was to be appointed by the Security Council, "after consultation with the Italian and Yugoslav Governments," and he was also made directly responsible to the Security Council. Despite the existence of a local Council of Government, a Popular Assembly elected by the people of the territory, and a Judiciary, the governor was given broad executive and emergency powers. In matters affecting the integrity and security of the territory and the civic and human rights of its inhabitants, he was empowered to issue decrees with the force of law and to suspend local administrative measures which in his opinion conflicted with the permanent Statute of the Free Territory.

The decision to turn Trieste into an international free zone under a governor appointed by the United Nations satisfied none of the Big Four, and it was generally feared in Washington at least, that this arrangement constituted the main source of potential future friction in connection with the peace treaties. Not only did the decision to internationalize the area take away from Italy approximately 330,000 Italian citizens and place them under a governor to be appointed by the United Nations, but it failed to guarantee the economic future of the port. In the past the prosperity of Trieste has depended on the support not only of Italy but of central and eastern Europe. If the new pro-Soviet states in this area should refuse to make a series of export and import agreements with the Free Territory, the area might become an economic as well as a political liability to the United Nations, as the Free Territory of Danzig was to the League of Nations after the First World War.

THE DANUBE

The Danube, which has been controlled by Russia since the end of the war because of the presence of Red Army troops in Hungary, Rumania, and Bulgaria, presented another controversial peacemaking issue. Britain and the United States contended that there should be freedom of navigation of the Danube not only for riparian states but for all countries interested in using this international waterway. The Western powers argued further that the Big Four should call a conference of the major powers, as well as the nations through which the river flows, in six months to set up an international regime for the control of Danubian traffic. In order to strengthen this international regime, the United States and Britain wished to embody the provisions for its establishment in the peace settlements rather than in a separate agreement, on the assumption that an agreement included in the treaties would carry particular weight. Russia, on the other hand, contended that there was no need to include references to the Danube or its navigation in any of the treaties and argued that the administration of the river's navigation was of concern to none but the riparian states themselves. At the Paris Conference, votes of 15 to 6 upheld the recommendations of Britain and the United States concerning the Danube, but at the final peace-drafting session of the Council of Foreign Ministers, the Western powers agreed to a compromise with the Soviet Union. According to this compromise, a provision for the free navigation of the Danube was written into the treaties with Rumania, Bulgaria, and Hungary. "Navigation on the Danube," according to this provision, "shall be free and open for nations, vessels of commerce and goods of all states on a footing of equality in port and navigation charges and conditions for merchant shipping, the foregoing not to apply to ports if in the same state." The last phrase was intended to prevent foreign ships from competing with local shipping within the territorial waters of the states concerned. However, in deference to the Soviet Union's objections to the inclusion in the peace treaties of arrangements for the establishment of an international regime for the Danube, the Western powers agreed to a separate Allied declaration calling for a Danube conference. According to this declaration the conference on the Danube will be held six months after the treaties come into force, and the participating states will be the Big Four, Ukranian SSR, and the riparian states, Rumania, Bulgaria, Yugoslavia, Hungary, Czechoslovakia, and Austria when the treaty with the latter former enemy country has been negotiated and signed.

SETTLEMENT OF DISPUTES ARISING UNDER THE TREATIES

On the question of how differences encountered in implementing the treaty provisions should be settled, the Western powers and Russia also found themselves at odds during the extended treaty negotiations. Britain and the United States urged that disputes should ultimately be sent to the International Court of Justice, while Russia insisted that the court of last resort should be a council of the Ambassadors of the Big Four in the capital of the country involved. At the Paris Peace Conference the British and American view was upheld by a vote of 15 to 6, but when the Russians refused to accept this proposal, the Council of Foreign Ministers found it necessary to strike a compromise. According to the agreement worked out in New York and included in the five peace treaties, economic disputes and disputes over interpretation and execution of the treaty clauses will be handled in three stages: first, by direct negotiation between the two disputants; second, if after two months they have arrived at no decision, the dispute shall be referred to the Ambassadors of the Big Four; third, if the Ambassadors are unable to reach a settlement within two months, either party to the dispute may ask the Secretary General of the United Nations to appoint a neutral umpire to make a binding decision.

REPARATIONS

One of the most sharply disputed points in connection with the discussion of the peace treaties was the amount of reparations which the various former Axis satellites should be required to pay. In connection with Italy particularly, the United States declared in the spring of 1946, that "in the interest of peace," it preferred to dismiss reparations charges, pointing out that it had already advanced directly or indirectly $900,000,000 to tide the Italian people over their economic crisis. After the second session of the Council of Foreign Ministers, however, Secretary Byrnes indicated that the United States would be willing to agree to "limited reparations," provided they did not deprive Italy of resources "necessary to enable her to subsist without external assistance." Under the agreement reached by the Big Four on the eve of the Paris Conference, Italy was to pay Russia the sum of $100,000,000, largely out of current production, over a period of seven years. Italy was not required to make payments from current production during the first two years, however, and Russia was to furnish the raw materials for the goods which Italy thus produced for Soviet reconstruction. To the Italians this latter provision was particularly objectionable since it seemed to offer Russia a possible means of interfering in Italian economic life on the pretext of collecting reparations.

During the final stages of the drafting of the Italian treaty the United States made one of the most important concessions at the Big Four meetings when it agreed that Italy, in addition to paying $100,000,000 reparations to Russia, should pay an additional $260,000,000 to Greece, Yugoslavia, Albania, and Ethiopia. In the case of the other former satellite states, particularly Hungary and Finland, the United States attempted to secure a reduction in reparations, but without success.

From the point of view of the former Axis satellites the reparations called for by the treaties represented a heavy burden, and none of the Allied powers defended the claims they made as being within the probable capacity of the former enemy nations to pay. From the point of view of the receiving powers, the provisions for reparations were also far from satisfactory. Even in the case of the Soviet Union, the largest recipient, the $900,000,000 worth of reparations it was scheduled to receive from Italy, Finland, Hungary, and Rumania represented only token payments for the vast damage the USSR had suffered during the war.

The problem of how much compensation should be paid to Allied property owners who had suffered wartime losses in former enemy states was also a source of inter-Allied debate. The United States favored 25 per cent compensation, as did the Soviet Union, while France and Britain, whose pre-war property holdings in the Balkans were considerably larger, pressed for 75 per cent compensation. After months of deadlock on this question, the United States and Russia finally agreed to 66 2/3 per cent compensation in the case of all five former Axis satellite states.

SUMMARY OF THE PEACE TREATY WITH ITALY

Territorial Changes.—France was awarded the small Alpine districts around Bridga and Tenda, near Nice, containing important hydroelectric developments. The French also secured small border rectifications in the region of the Little St. Bernard Pass, the Mont Cenis Plateau, and Mont Thabor.

Greece secured the Dodecanese Islands, located in the eastern Aegean. It was provided that these islands should remain demilitarized.

Albania received the Island of Saseno, situated at the narrowest point of the Strait of Otranto.

Yugoslavia secured the Adriatic ports of Pola and Fiume, two-thirds of the Istrun Peninsula, and most of Venezia Giulia, to the north of Trieste.

African Colonies.—Italy renounced all rights to its African colonies of Libya, Eritrea, and Italian Somaliland, which, pending their final disposal, are to remain under British military control. The final disposition of these possessions is to be determined by the Big Four powers within one year after the Italian treaty comes into effect. If the Big Four should be unable to agree within a year on the future of the colonies, the question of the ultimate disposal will be decided by the United Nations General Assembly, with advance concurrence by the Big Four.

Trieste.—Trieste was constituted a Free Port in which special harbor facilities were to be provided for both Italy and Yugoslavia. The city and its immediate hinterland were formed into a demilitarized and neutral Free Territory, in which the governor, who was made directly responsible to the United Nations Security Council, was given sweeping executive and emergency powers.

Military Clauses.—Italy's permanent frontier fortifications were to be destroyed, and Pantellaria and other formerly fortified islands were to be demilitarized.

The Italian army was limited to a force of 185,000 combat, service and overhead personnel and 65,000 Carabinieri (armed police).

The Italian navy was restricted to two battleships, four cruisers, four destroyers, 16 motor torpedo boats, and 19 corvettes, with a maximum naval personnel of 25,000 officers and men. Remaining units were to be placed at the disposal of the governments of the Soviet Union, United States, Britain, and France within three months after the coming into effect of the peace treaty. These provisions concerning the Italian Navy constituted the most important of the military clauses written by the Allies in the peace treaties, for they reduced the Italian navy to a point that would prohibit Italy from exercising anything resembling her old naval influence.

The Italian air force was limited to 200 fighter and reconnaissance aircraft and 150 transport and liaison aircraft. and air force personnel was restricted to a total of 25,000. Bombers were prohibited.

Reparations. — Italy's total reparations bill was set at $360,000,000, to be paid largely in goods over a period of seven years. Of the total bill, $100,000,000 is to be paid to the Soviet Union from such sources as equipment designed for the production of war material, Italian assets in Rumania, Bulgaria, and Hungary, and, after the first two years, current industrial production. In order to facilitate the collection of reparations from this last source, the Soviet Union agreed to furnish to Italy, on commercial terms, the materials which are normally imported into Italy and which are needed for industrial production. Payments for these materials shall be made by deducting the value of the materials furnished from the value of the goods delivered to the USSR.

In addition to paying $100,000,000 reparations to Russia, Italy is to pay $125,000,000 to Yugoslavia, $105,000,000 to Greece, $25,000,000 to Ethiopia and $5,000,000 to Albania. The quantities and types of goods and services to be delivered to these smaller powers shall be determined by agreements between the governments entitled to receive reparation and the Italian government. The treaty also declares that deliveries shall be scheduled in such a way as to avoid interference with the economic reconstruction of Italy.

HUNGARY

Territorial Changes. — Rumania was awarded Northern Transylvania. Rumania had received this territory, which has a predominantly Rumanian population, from Hungary under the Treaty of Trianon of 1920, but had been forced to relinquish it to Hungary at the demand of Hitler in 1940. Czechoslovakia was awarded a small Danubian bridgehead and three villages on the southern bank of the Danube.

Military Clauses.—The Hungarian army was limited to 65,000 men; the air force to 90 planes and 5,000 men. Bombers were prohibited.

Reparations. — Total reparations payments in kind of $300,000,000 are to be made over an eight-year period, from Jan. 20, 1945. The reparations are to be divided as follows: $200,000,000 to the Soviet Union, $50,000,000 to Yugoslavia, and $50,000,000 to Czechoslovakia.

BULGARIA

Territorial Changes.—Bulgaria lost no territory, and it acquired southern Dobruja from Rumania. Despite Greek claims to considerable frontier adjustments and a demand for three small changes as a protection for the seaport of Salonika, the Council of Foreign Ministers decided to make no change in the pre-war boundary between Greece and Bulgaria because of the tense situation on the Greek-Bulgarian frontier.

Military Clauses.—The army was limited to 55,000 troops, the navy to 7,250 tons and 3,500 men, the air force to 90 aircraft and 5,200 men, with bombers prohibited. Fortifications along the Greek-Bulgarian frontier were forbidden.

Reparations.—The treaty provided that Bulgaria should compensate Yugoslavia and Greece for the losses resulting from its military operations and occupation. At the same time, however, the parties to the treaty agreed that, in view of Bulgaria's withdrawal from the war against the United Nations and its participation in the war against Germany, Bulgaria should pay only $70,000,000 in reparations over a period of eight years beginning from the coming into force of the peace treaty. Of this sum, $45,000,000 was to be paid to Greece and $25,000,000 to Yugoslavia.

RUMANIA

Territorial Changes. — The Soviet Union secured Bessarabia, which had formed a part of the Czarist Empire before the First World War, and Northern Bukovina, which had belonged to the Austro-Hungarian Empire until 1918. Rumania was also obliged to cede the area of Southern Dobruja to Bulgaria. This territory which had been transferred by Bulgaria to Rumania in 1913 during the Balkan wars, and recovered by Bulgaria in 1918, had again been lost to Rumania, when the Treaty of Neuilly was made with Bulgaria in 1919.

Military Clauses.—The Rumanian army was limited to 120,000 troops of all types, the navy to 15,000 tons and 5,000 men, and the air force to 150 aircraft and 8,000 men. All bombers were prohibited.

Reparations.—Rumania is to pay a total of $300,000,000 in reparations to the Soviet Union over a period of eight years, from Sept. 12, 1944. Payment is to be made in oil products, grain, timber, seagoing and river craft, sundry machinery, and other commodities.

FINLAND

Territorial Changes. — Russia secured the Karelian Isthmus and the Arctic province of Petsamo, and a 50-year lease to the naval base at Porkkala.

Military Clauses. — More severe military restrictions were made upon Finland than upon any of the other former Axis satellites. The army was restricted to 34,400 men, the navy to 10,000 tons and 4,500 men, and the air force to 60 aircraft and 3,000 men, with bombers prohibited.

Reparations. — Finland was required to pay a total of $300,000,000 to Russia over a period of eight years from Sept. 19, 1944 in timber products, paper, cellulose, seagoing and river craft, sundry machinery, and other commodities.

CLAUSES COMMON TO ALL THE TREATIES

Withdrawal of Allied Troops.—All the treaties provided for the withdrawal of Allied troops within 90 days after the treaties went into force. In the case of Hungary and Rumania, however, Russia was permitted to maintain lines of communication through these countries with the Soviet-occupied zone of Austria. The number of troops Russia would be permitted to maintain for this purpose was unspecified. This meant that until a treaty was signed with Austria, Hungary and Rumania would remain under Soviet military occupation. In the case of the Free Territory of Trieste, moreover, the governor was authorized to decide within 90 days after the coming into effect of the Italian peace treaty whether Allied occupying troops were still required, and if not they were to be withdrawn within 45 days. If, on the other hand, he should decide that troops are still required, the British and American forces in Trieste would be retained until 45 days after he states that their presence is no longer required.

Forbidden Weapons.—All five of the former Axis satellites were forbidden to have atomic weapons, self-propelled or guided missiles, any guns with a range of more than 30 milimeters, and any non-contact type of mines or torpedoes capable of being manned.

Economic Clauses.—All five countries undertook to return property removed from the territory of any of the United Nations; to waive all claims against Allied powers arising from the war; to restore all legal rights and interests of United Nations and their nationals; to surrender any property or assets in Allied nations wanted for the settlement of war claims; to compensate two-thirds of the losses suffered by United Nations holders of property in the respective countries before the war.

Human Rights. — The treaties required all to take any measures needed to guarantee enjoyment of human rights and fundamental freedoms, including free speech, press, religion, political opinion, and public meetings. All five were also admonished to stamp out the remnants of Nazism and Fascism within their countries.

TOWARD PEACE WITH GERMANY AND AUSTRIA

Having reached agreement on the peace treaties with the former Axis satellites, the Big Four turned to the key problem of Germany and Austria. On Dec. 9, 1945, the Foreign Ministers decided to hold their fifth session in Moscow on March 10, 1947, for the purpose of discussing the peace settlement with the Germans and Austrians. As 1946 ended, therefore, the Allies were preparing to face an even more complex set of issues than that which had confronted them in connection with Italy and the Axis satellites.

THE UNITED STATES AND EUROPE

By Winifred N. Hadsel
Research Associate, Foreign Policy Association

U. S.–SOVIET POLICY

The major task confronting the United States in Europe during 1946 was that of bridging the gap between its own policies and those of the Soviet Union toward the Continent in order to establish a firm basis for world peace and security. The sharp differences between Moscow and Washington were underlined by Generalissimo Stalin when he declared in a speech to the Russian people on Feb. 9, 1946 that the "capitalist system breeds crises which lead to war." In the United States Senate, Senator Arthur H. Vandenberg (Mich.) promptly expressed concern over the apparent belief on the part of the Soviet leader that capitalism and communism were incompatible. In a speech on Feb. 27, Senator Vandenberg observed: "I read in every newspaper: 'What is Russia up to now?' It is the supreme conundrum of our time."

American official policy toward Russia was stated by Secretary of State James F. Byrnes on Feb. 28, 1946 when he remarked: "We will not and we can not stand aloof if force or the threat of force is used contrary to the purposes and principles of the (UN) Charter." This statement by Byrnes marked the beginning of what came to be known as the "firm" American attitude toward Russia. Throughout the negotiations on the peace treaties with the former Axis satellites and in other dealings with Russia, Secretary Byrnes adhered to this policy, and in doing so he received the support of the Administration and of Republican leaders as well.

THE WALLACE CONTROVERSY

On Sept. 12, however, Henry A. Wallace, then Secretary of Commerce and the only "left-wing" Democrat who remained in President Truman's Cabinet, made a speech at Madison Square Garden, New York City, strongly criticizing United States' policy toward Russia. Wallace seemed to suggest that the world should be divided into orbits and that the United States should not interfere in Russia's sphere any more than Russia should interfere in that of the United States. Although President Truman had previously approved Wallace's speech, he called for and received his resignation (Sept. 20) when the attack on Secretary Byrnes' policy caused a worldwide controversy as to how far the American people had reached fundamental agreement on the role of the United States in world affairs.

Either because of this indication that the United States intended to adhere to its firm policy toward Russia, or because of the Soviet Union's preoccupation with its own internal problems of reconstruction, Generalissimo Stalin made a statement on Sept. 24 which indicated a shift in Russian foreign policy. In a special and highly publicized interview, the Generalissimo declared that he saw "no threat of war," and he insisted that capitalism and communism could collaborate peacefully. He also hinted that Russia would welcome economic assistance from the West.

Following this statement by Stalin, there was a noticeable decline in tension between the USSR and the United States. Although the two major powers remained deadlocked on many important issues, a period of better feeling prevailed between Moscow and Washington during the last few months of 1946 than had existed at any time since the end of the war.

EASTERN EUROPE

Throughout 1946, however, the United States and Russia continued to find it difficult to reconcile their views as to the "democratic" nature of Communist-dominated regimes in eastern Europe. At the Moscow Conference of the Big Three Foreign Ministers in December 1945, the United States and Britain had attempted to secure the inclusion in the Bulgarian and Rumanian governments of important elements of the democratic opposition as the basis for American and British recognition of these former enemy states.

RUMANIA AND BULGARIA

In Rumania this effort met with a certain degree of success. During the first week of January 1946, two representatives of the Opposition parties were admitted to the government, and official assurances were given that free elections would be held. Accordingly, the United States and Britain recognized Rumania on Feb. 4, 1946. In Bulgaria, however, the Opposition leaders, in the belief that joining the government without guarantees of free elections would be tantamount to unconditional surrender, refused to accept an offer of the government which precluded any change in official policies. The Bulgarian government, supported by the Soviet Union, thereupon took the view that it had fulfilled its obligations under the Moscow agreement by making a proposal to the Opposition, whether or not the offer was accepted. The United States and Britain expressed their disagreement with this view on Feb. 22, and declared that recognition would not be forthcoming until two Opposition leaders joined the government on a mutually acceptable basis. The Bulgarian government, confident of Soviet backing, ignored the objections of the Western powers, and no further progress was made during the year toward removing Big Three differences over Bulgaria.

"FREE AND UNFETTERED ELECTIONS"

Repeated efforts by the United States to persuade the governments of Bulgaria, Rumania, and Poland to hold "free and unfettered elections," as provided in various Big Three agreements at the Yalta, Moscow, and Potsdam conferences, met with little success. In the case of the Bulgarian elections of Oct. 27, the United States issued no official comment, since the Bulgarian government had not secured American recognition following a pledge to hold free elections. The State Department indicated unofficially, however, that it did not regard the results of the poll—in which the Communists received 277 of the 465 seats in parliament, while the four other parties belonging to the Fatherland Front coalition won only 87 seats and the Opposition obtained 101 places—as an accurate reflection of Bulgarian sentiment.

In the case of the Rumanian elections of Nov. 19, the United States was more outspoken in its criticism. In these elections the Communist-controlled government bloc received 4,766,360 votes, while all other groups received 1,931,167 votes. In a formal statement issued on Nov. 26, Acting Secretary of State Dean Acheson charged the Rumanian government of electoral malpractices and refused to accept the voting as a fulfillment of Rumania's pledge to hold fair elections. Despite this American contention that Rumania had not complied with the promises on which United States recognition had been based, Washington did not sever diplomatic relations with Bucharest.

As the Polish government prepared to hold elections on Jan. 19, 1947, the United States notified the government in Warsaw, on Nov. 22, that it had received "disturbing reports" concerning the preparations for the elections. The American note firmly reminded the Polish government that the United States expected all anti-Nazi and democratic Polish parties to enjoy equal rights both in the electoral campaign and in the elections. Toward the end of the year, American journalists in Poland reported mass arrests of Opposition leaders and numerous attacks on Stanislav Mikolajczyk, the leader of the Peasant party, as the "tool" of "British and American imperialism" in Poland.

As the year ended, therefore, American efforts to secure "free and unfettered elections" in eastern Europe had failed in many important respects. The United States maintained hope, however, that Russia, if assured of security, might eventually be induced to permit greater political freedom in eastern Europe, and that local non-Communist groups might then be able to cooperate in establishing genuinely representative governments.

YUGOSLAVIA

Strained relations existed between the United States and Yugoslavia during most of 1946. On Aug. 19, five American airmen were killed when their unarmed plane was shot down over Yugoslavia by a Yugoslav fighter plane. The State Department, in a strongly worded note of Aug. 21, demanded indemnity from the Tito government and investigation of the circumstances attending the tragedy. The incident was formally closed Oct. 9, when the Yugoslav government assured the United States that orders had been given that American planes were not to be fired upon in the future and agreed to pay $150,000,000 indemnity for the loss of American lives and property.

During the later summer and autumn, additional friction developed between the United States and Yugoslavia as a result of the decision of the Yugoslav government to close the United States Information Service in Belgrade. The trial of Archbishop Aloysius Stepinatz, Roman Catholic Primate of Zagreb, on charges of wartime collaboration with the pro-Nazi Ustashi group, also incurred American protests. On Oct. 11, when the Yugoslav court pronounced the Archbishop guilty and sentenced him to 16 years in prison, Acting Secretary of State Acheson officially expressed "concern and deep worry" over the manner in which the trial had been conducted.

CZECHOSLOVAKIA

Relations between the United States and Czechoslovakia, which had traditionally been very close, also deteriorated during 1946. In September, the State Department cancelled $40,000,000 of a $50,000,000 loan the United States had extended to Prague for the purchase of United States Army surplus goods in Europe, and suspended negotiations for an additional $50,000,000 credit from the Export-Import Bank. One reason given by the United States for its action was that the Czechoslovak government had made plans for reselling U. S. Army surplus goods to Rumania without informing Washington. A more important explanation, however, was that offered by Secretary Byrnes Oct. 22, when he declared that the United States did not wish to extend loans to countries which might feel "enslaved" by these loans. This explanation was generally interpreted as a reference to the attacks which had recently been made by the Czechoslovak Communist press upon American "policies of economic imperialism" in eastern Europe.

GREECE

The United States, along with Great Britain and France, participated in the Allied Mission for Observing the Greek Elections on March 31, 1946. This Mission was formed in accord with the terms of the Yalta agreement, which provided that the major Allies should assist the liberated countries in holding free elections, if requested to do so by the nations concerned. Russia, however, refused to participate in observing the elections, on the ground that such observation would curb the sovereignty of Greece.

The Allied Mission, in its formal report, declared that the elections, in which the Populist (Royalist) party won a small majority, were "on the whole free and fair, and the results represent a true and valid verdict of the Greek people." At the same time, the Mission acknowledged the existence in Greece of intense emotions, the difficulty of establishing the validity of electoral lists, and the fact that the extreme Left had boycotted the elections. In the opinion of the Mission, however, the full participation by the Left "would not have altered the general outcome."

During April 1946 the *U. S. S. Missouri,* the battleship on whose decks the armistice with Japan had been signed in 1945, visited Greek waters on a "goodwill mission." This mission clearly revealed the determination of the United States to participate in eastern Mediterranean affairs and to warn the Soviet Union that the United States would oppose any efforts on the part of Russia to gain control of the Dardanelles. (See Dardanelles.)

On Sept. 1, 1946, a plebiscite on the return of King George II was held in Greece, and the pro-monarchist forces won approximately 72 per cent of the ballots cast. Since no Inter-Allied Mission had been responsible for the observation of this election, the United States made no formal statement on the conduct of the plebiscite.

The United States viewed with concern the repeated incidents which took place during the year along the northern frontiers of Greece and between "rebels" and Greek government forces throughout the country. Accordingly, the American representative on the Security Council proposed that the United Nations hold an inquiry into the causes of these disturbances. The Soviet Union, which had previously questioned the presence of British troops in Greece, opposed this proposal, unless Bulgaria and Albania, which were not members of the United Nations, were invited to participate in the investigation. When a majority of the Security Council refused to include Bulgaria and Albania on the commission of inquiry, Russia finally agreed to the naming of an investigatory body consisting of representatives of each of the 11 nations belonging to the 1947 Security Council, provided Bulgaria and Albania would be permitted to make declarations to the commission. At the end of December this commission, which was the first United Nations body instructed to carry out an investigation on the spot for the Security Council, was named. Mark Ethridge, publisher of the Louisville (Kentucky) *Courier Journal,* represented the United States on the commission.

DARDANELLES

On the issue of the control of the Dardanelles, the United States took the lead in opposing the Soviet concept that the Straits were of interest only to the Black Sea powers, and hence the proper subject of virtual Russian control. In a firm note to Moscow Oct. 9, 1946, the United States insisted that "the regime of the Straits is a matter of concern not only to the Black Sea powers but also to the other powers, including the United States." Washington accordingly declared that the United States did not consider that the agreement reached at the Potsdam Conference of the Big Three in August 1945 for the revision of the Montreux Convention prejudiced the participation of the United States and Britain in a new Straits regime. In a concluding paragraph which clearly revealed the determination of the United States to prevent Russian control of the Dardanelles, the American note declared: "My Government also feels that it would be lacking in frankness if it should fail to point out again at this time . . . that in its opinion the Government of Turkey should continue to be primarily responsible for the defense of the Straits and that, should the Straits become the object of attack or threat of attack by an aggressor, the resulting situation would be a matter for action on the part of the Security Council of the United Nations." Britain, as a Mediterranean power and an ally of Turkey, also supported the view that the control of the Straits was of concern to nations other than those adjoining the Black Sea, and it joined the United States in protesting the Soviet attitude. By the end of the year, however, no arrangements had been made for calling an international conference instructed to revise the Straits Convention.

GERMANY

In Germany, the problems of accommodating the political, ideological, and economic interests of Russia and the Western powers were even more difficult than they were in eastern Europe. The continued division of Germany into occupational zones reflected the inability of the Allies to agree on the future of this still powerful country of 142,000 square miles and an estimated population of 59,500.000 in the heart of Europe.

The most important inter-Allied debate on Germany took place during the final meetings in Paris of the third session of the Council of Foreign Ministers, which had been discussing the treaties with the former Axis satellites. The Foreign Ministers' discussion indicated that all three major powers agreed that it was neither desirable nor practical to strip Germany of productive capacity and reduce it to an agrarian state. As Foreign Minister Molotov declared on July 10, "such a course would result in undermining the economy of Europe, in the dislocation of world economy, and in a chronic political crisis in Germany that would spell a threat to peace and tranquility." This pronouncement by the Soviet representative bore a close resemblance to numerous British and American statements on Germany's economic needs. Moreover, the Russian suggestion that the "level of industry proposal" for Germany, announced by the Allies on March 28 and designed to reduce Germany industry to half its pre-war production by 1949, might have to be revised upward, met with the approval of the Western powers.

Despite this show of Allied agreement that German economic revival was essential to the self-sufficiency of the occupied country itself and the reconstruction of Europe as a whole, the Western powers and Russia favored the economic recovery of Germany for such different reasons that their unanimity on the diplomatic level had no practical effects on administrative practices. To the British and Americans, whose zones were deficient in essential food production, it was important that the Germans in the western areas be permitted to become industrially active and exchange their local production for food, raw materials, and essential consumer goods which might be available either in the Russian zone or abroad, in order to become self-supporting. The United States found that the food and other forms of relief it was obliged to send to its occupied zone in order to maintain the Germans at a bare subsistence level cost approximately $200,000,000 per year, and Britain found that its annual financial burden in Germany amounted to approximately $320,000,000. The Russians, on the other hand, held that the economic revival of Germany, and particularly the heavily industrialized Ruhr, was desirable because the Soviet Union needed virtually unlimited quantities of German manufactured goods and wished to secure these goods free as reparations.

Where the Western powers and Russia differed most sharply, however, was on the kind of Germany they wanted to see achieve economic and political unity. The Russians wished to establish in Germany a regime composed of "friendly" elements—a Communist-dominated coalition. The Western powers, on the other hand, favored a "democratic" Germany, and they hoped that, by improving economic conditions in Germany, they might avert the spread of Communist influence in Germany.

Having failed to achieve Big Three agreement on the immediate establishment of economic unity in Germany, the United States took the initiative in securing whatever degree of unification might be possible in order to improve conditions in Germany.

On July 11, Secretary Byrnes announced that the United States proposed to "join with any other occupying government in Germany for the treatment of our respective zones as an economic unit." Although Britain alone among the other occupying powers accepted this proposal, the United States decided to proceed with this limited unification. Negotiations thereupon took place in Washington during November and December for the economic merger of the British and American zones, and on Jan. 1, 1947, the economic unification of these areas of western Germany was formally announced.

Lest the Germans become convinced that it was only by establishing a strongly centralized Communist regime that they might regain national unity, Secretary Byrnes, in an address delivered at a special meeting of Allied and German officials at Stuttgart Sept. 6, indicated that the United States opposed not only Germany's economic disunity, but its lack of political unity as well. To achieve this unity, Byrnes suggested that a German National Council composed of "democratically responsible" officials should be established as soon as possible. He made it clear, however, that the establishment of this central administrative body must not be permitted to lead to German military resurgence. As a means of preventing this result he repeated the proposal, which he had previously made on April 29, for a 25-year alliance of the Big Four. Although the suggestion met with approval in London, it was coolly received both in Paris and Moscow, and no additional efforts were made during 1946 to implement this proposal.

By expressing disapproval of far-reaching territorial changes in Germany, Secretary Byrnes brought out into the open some of the most delicate questions posed by the German problem. Since the Soviet proposal for "the ultimate transfer to the Soviet Union of the City of Koenigsberg and the area adjacent to it" had been approved in principle at the Big Three Conference at Potsdam in August 1945, Byrnes declared that "we will certainly stand by (this) agreement." However, as far as Poland was concerned, he pointed out that the Potsdam Declaration had stated that "Pending the final determination of Poland's western frontier," certain specified German territories, including the portion of East Prussia not placed under the administration of the USSR and including the former free City of Danzig, "shall be under administration of the Polish State." As Byrnes declared, the phrasing of the Potsdam agreement clearly left the way open for revision of what had been intended as a tentative border settlement. Although, therefore, the United States was willing to support revision of Poland's northern and western frontiers, Byrnes declared that "the extent of the area to be ceded to Poland must be determined when the final settlement is agreed upon." This statement indicated that the United States would regard the question of Poland's western boundary a proper subject of discussion when the Council of Foreign Ministers considered the German peace treaty at their next meeting scheduled to be held in Moscow in March 1947. Since, however, Poland viewed its acquisition of German territory as final, particularly since the Soviet government had promised this territory as compensation for the areas of eastern Poland which Russia annexed at the end of the war, it appeared that the United States might find its attitude toward the German territorial settlement seriously challenged.

NUREMBERG TRIBUNAL'S JUDGMENT

In a document of 50,000 words the Nuremberg International Military Tribunal passed judgment Oct. 1, 1946 on the major Nazi leaders who had gone on trial before the court nearly a year before.

The penalty of death by hanging (carried out Oct. 16) was decreed for 12 of the defendants. Those condemned were Hermann Goering (who committed suicide in his cell a few hours before the executions, thus fulfilling his boast that the Allies would never succeed in hanging him), Joachim von Ribbentrop, Field Marshal Gen. Wilhelm Keitel, Ernst Kaltenbrunner, Dr. Alfred Rosenberg, Hans Frank, Wilhelm Frick, Julius Streicher, Fritz Sauckel, Col. Gen. Alfred Jodl and Arthur Seyss-Inquart. Martin Bormann, who succeeded Rudolf Hess as Deputy Fuehrer and who was tried in absentia owing to the lack of conclusive evidence of his death, also was sentenced to death by hanging if he should ever be apprehended.

Three others—Dr. Hjalmar Schacht, Franz von Papen and Dr. Hans Fritzsche—were acquitted by the Tribunal over the dissent of the Soviet Member of the court.

Life imprisonment was meted out to Hess, Walther Funk, and Grand Admiral Erich Raeder. The Soviet judge likewise dissented from his colleagues' judgment on Hess, expressing the opinion that he had merited death. Baldur von Schirach and Albert Speer each received 20-year terms. Baron Constantin von Neurath received the comparative mild sentence of 15 years imprisonment. The lightest punishment of all fell to Grand Admiral Karl Doenitz, who was given a term of ten years in prison.

Concerning the lesser German war leaders who had not been tried by the Nuremberg Tribunal, Justice Robert H. Jackson, chief United States counsel for the prosecution at Nuremberg, declared in a report to President Truman that "there are many industrialists, politicians, diplomats, and police officials whose guilt does not differ from those who have been convicted except that their parts were at lower levels and have been conspicuous." He recommended that each occupying power try these cases within its own zone. Within the American zone alone there were approximately 80,000 accused Nazi leaders in prison camps awaiting trials. Since the Nuremberg Tribunal held, in a decision from which the Russian judge dissented, that entire Nazi or German groups could not be condemned, individual members of organizations, such as the Elite Guard, the Storm Troopers, and the General Staff, must be tried separately.

PRECEDENTS SET BY THE TRIBUNAL

The Nuremberg Tribunal, which had been established by an agreement of Aug. 8, 1945, among the governments of 23 Allied nations, had been invested by its Charter with power to try and punish persons who had committed crimes against peace, war crimes and crimes against humanity. In exercising these powers, the Tribunal laid down at least two major precedents, perhaps the most far-reaching being that individuals might be held personally responsible for the actions of the state they represent. Precedents were adduced to show that, even though the subjects of international law are not individuals but states, individuals have been regularly held criminally accountable for breaches of this law. Accordingly, the argument that responsibility for a sovereign act of a State can not be placed upon the Ministers who ordered the action was overruled.

The court laid down a second precedent of importance when it decided that the levying of aggressive war is a crime. This ruling rested upon a succession of treaties and agreements, to which Germany was a party, and which culminated in the Kellogg-Briand Pact of 1928 outlawing war as an instrument of national policy. On the basis of this ruling, the court held that the subversion under threat of war of the independence of Austria and Czechoslovakia, as well as the armed invasion of a long list of countries from Poland in 1939 to the Soviet Union in 1941, were criminal acts of the Nazi State.

OBJECTIONS BY SENATOR TAFT

Senator Robert A. Taft of Ohio, a Republican leader frequently mentioned as a possible presidential candidate, was the only prominent American leader who publicly took issue with the precedents laid down by the Nuremberg court. In a speech at Kenyon College on Oct. 5, Senator Taft charged that the verdict at Nuremberg represented a miscarriage of justice which the American people would long regret. The Nuremberg Tribunal, he declared, had violated "that fundamental principle of American law that a man can not be tried under an *ex post facto statute*." He stated, moreover, that no trial of the vanquished by the victors could be impartial no matter how it was hedged about by the forms of justice. "In these trials," he charged, "we have accepted the Russian idea of the purpose of trials, Government policy and not justice, having little relation to our Anglo-Saxon heritage."

DOCUMENTARY EVIDENCE PRESENTED AT NUREMBERG

In addition to passing judgment on the major Nazi leaders and setting precedents of international law, the Nuremberg court brought to light many important facts about Germany's war plans, for much of the evidence presented to the Tribunal consisted of German documents captured by the Allied armies. Some of the most important revelations made during the course of the trials were the following:

Czechoslovakia. — Documents reviewed at the trials revealed that on April 21, 1938, Hitler and Keitel fully considered preparations for an attack on Czechoslovakia by means of "Operation Green." On May 28, 1938, Hitler ordered that preparations should be made for military action against Czechoslovakia by Oct. 2, and from that date onward the plan to invade Czechoslovakia was constantly under review. On Aug. 31, 1938, Hitler approved a memorandum by Jodl concerning the timing of the order for the invasion of Czechoslovakia. The documents also revealed that, shortly after the conclusion of the Munich Pact which provided for the annexation of the Sudetenland to the Reich as the Basis for a Czechoslovak-German settlement, Hitler had no intention of adhering to this agreement and instead gave orders for the "liquidation of the remainder of Czechoslovakia."

Poland.—On May 23, 1939, Hitler announced at a military conference his decision to attack Poland by "Operation White," and he indicated that he was fully aware that the attack would probably lead to war with France and Britain. He declared, however, that this was a risk he was willing to take.

Belgium, Holland and Luxembourg.—The captured German documents also revealed that the plan to seize Belgium and The Netherlands was considered in August 1938, when the attack on Czechoslovakia was being formulated and the possibility of war with France and Britain was contemplated. In May 1939, when Hitler decided to attack Poland and realized that war with England and France was not only possible but practicable, he declared that "Dutch and Belgian air bases must be occupied . . . Declarations of neutrality must be ignored."

USSR — Evidence presented at the Tribunal indicated that the USSR had "unmistakably" conformed to the terms of the Soviet-German non-aggression pact of Aug. 23, 1939. The German government itself had been assured of this fact by the highest Russian sources. Nevertheless, as early as the late summer of 1940 Germany began to make preparations for "Operation Barbarossa" against the USSR, and the plans were finally completed at the beginning of November 1940, and on Dec. 18, 1940 Hitler issued directives calling for completion of all preparations connected with the Operation. Immediately after the invasion, Rosenberg, following conferences with Keitel, Jodl, Raeder, Funk, Goering, Ribbentrop, and Frick, worked out a plan for the future political and economic organization of the occupied Soviet Territories. These plans outlined the destruction of the Soviet Union as an independent state, and its partition, the creation of so-called Reich Commissariats, and the conversion of Estonia, Latvia, Byelorussia, and other territories into German colonies.

United States.—From the conclusion of the Tripartite Pact on Sept.

27, 1940, German leaders encouraged the Japanese to attack Singapore and other British possessions in the Far East and assured them that, if such an attack led to war with the United States, Germany would "strike without delay." Ten days before Pearl Harbor, Ribbentrop told the Japanese Ambassador in Berlin that if Japan attacked the United States, Germany would at once join in war against the United States. Accordingly, four days after the Japanese attack on the American fleet in Pearl Harbor, Germany declared war on the United States.

U. S. LENDING POLICY—RUSSIA

The question of whether the United States should extend loans on a purely commercial basis or should use its financial power to implement the broad political and economic objectives of this country was the subject of important public and private debates during 1946.

In the case of Russia the debate was particularly heated. Under the leadership of Henry A. Wallace, prior to his resignation from the Cabinet on Sept. 20 (see Wallace Controversy), the Department of Commerce maintained that the United States should grant the USSR a loan on a strictly commercial basis and should not use its economic power for the purpose of inducing Russia to modify its restrictive trade arrangements in eastern Europe. In a letter to President Truman on July 23, setting forth his views on foreign policy, Wallace declared that "the question of a loan (to Russia) should be approached on economic and commercial grounds," since in this way the United States would be able to demonstrate that it is "not attempting to use its economic resources in the game of power politics."

The State Department, on the other hand, which drafted the correspondence Washington carried on with Moscow concerning a possible $6,000,000,000 American loan to Russia, insisted that the credits should be granted only after a satisfactory arrangement had been reached regarding Soviet trading practices, such as bilateral trade agreements, which ran counter to American foreign economic policy. Despite continued unofficial indications from Russia that the Kremlin would welcome a loan from the United States, Moscow had sent no reply by the end of 1946 to Washington's last note, dated June 13, on this subject. In Washington, Moscow's silence was interpreted as meaning that the Soviet Union was unwilling to grant the United States larger trading opportunities in eastern Europe, at least at a moment when the Russians were deeply conscious of their inability to compete with American exports.

LOAN TO GREAT BRITAIN

The credit of $3,750,000,000, which the United States advanced to Britain in 1946, constituted the largest and most important loan which this country made during the year. After months of negotiation, a tentative agreement between the United Kingdom and the United States had been reached Dec. 7, 1945, and on Jan. 30, 1946, President Truman requested Congress to approve this arrangement. On May 10, the Senate agreed to the proposal by a vote of 46 to 34, and on July 13 the House adopted the measure by a vote of 219 to 155.

The loan to Britain was originally designed as the major item on Washington's post-war program for reestablishing multilateral world trade. To this end Britain agreed that, if it received the American credits, it would consider reduction of its imperial preferences and relax exchange controls over the sterling area. Before the loan agreement was finally passed by Congress, however, it had taken on political implications. For the belief that Britain, if it received American financial aid, would be in a stronger position to counterbalance Russia's economic and political power, played an important part in securing Congressional approval for the loan.

EXPORT-IMPORT BANK LOANS

During 1946 the United States Export-Import Bank, which had been established by Congress in 1945, continued to be the major source of American loans to liberated and war-devastated countries. The European nations which secured credits from the Bank during 1946 were the following:

Czechoslovakia.—In May 1946, a $20,000,000 credit for the purchase of American cotton was extended to Czechoslovakia, and in October an additional credit of $2,000,000 for the purchase of tobacco was authorized. However, approximately $40,000,000 of a $50,000,000 credit for the purchase of U. S. Army surplus goods in Europe was cancelled in September, and negotiations for an additional $50,000,000 loan from the Bank were suspended (see Czechoslovakia).

Finland.—A $35,000,000 credit from the Export-Import Bank was extended to Finland in January 1946 for the purchase of American supplies, materials, equipment, and services. This credit was in addition to an allocation during 1945 of $5,000,000 to Finland for the purchase of American cotton.

France.—In May 1946, France received a credit of $650,000,000, one of the largest loans made by the Export-Import Bank, for the purchase of American equipment and materials required for the reconstruction and modernization of French industry Since Leon Blum, veteran leader of the French Socialist party, represented France during the loan negotiations in Washington, the loan assumed political significance and was widely interpreted as an effort on the part of the United States to encourage moderate political groups in France. This $650,000,000 credit was in addition to that for $550,000,000 authorized by the Bank in 1945.

Greece.—The Bank approved a credit of $25,000,000 to Greece in January 1946 to finance the purchase of American materials required for the restoration of productive facilities in Greece.

Italy.—During 1946, the only credit the United States extended to Italy was a cotton credit of $25,000,000.

The Netherlands.—A credit of $200,000,000 to The Netherlands was approved by the Bank in April 1946. This credit was in addition to the two loans, totaling $100,000,000, extended by the Bank during 1945. The 1946 credit was notable because private capital participated in the loan to the extent of approximately 50 per cent, thus indicating the confidence of American investors in the financial soundness of the Netherlands.

Turkey.—Turkey received a $25,000,000 credit in September 1946.

Poland.—The Bank approved a credit of $40,000,000 to Poland in April 1946 for the purchase in the United States of locomotives and coal cars for the Polish State Railways. The economic purpose of the credit was not only to assist in the rehabilitation of Poland but to provide the means of transporting Polish coal to other European countries where coal was a prime requirement for reconstruction.

OCCUPIED JAPAN

By PAUL M. A. LINEBARGER

PROFESSOR, SCHOOL OF ADVANCED INTERNATIONAL STUDIES

GENERAL

Throughout 1946, Japan remained under occupation by the Allied powers. The United States continued to be the power chiefly responsible for both military occupation and political tutelage. The year was marked by an uneventfulness almost unprecedented in the history of military government; General of the Army Douglas MacArthur was in immediate charge of both military and administrative phases of the occupation. With the title, Supreme Commander for the Allied Powers, he has the Japanese emperor, government, and people under his immediate authority. The title, abbreviated to

SCAP, is widely used to indicate not merely the general himself but his organization as well.

Hirohito, Emperor of the Age of Showa, has retained his throne despite previous wartime incumbency. He lost his previously alleged Shintoist divinity through voluntary disavowal early in the year; later in the year he lost his constitutional position as the source of Japanese sovereignty. He continues to reign as monarch, subject to the unqualified authority of the Allied powers through SCAP.

Economically and politically Japan has benefited under the American occupation. Her condition is in striking contrast to that of the surrounding countries. Since no general political settlement has been achieved or even sought in the Far East by the Big Four powers, acting together, China has remained in turmoil despite General George C. Marshall's prolonged mediation between Nationalists (Kuomintang) and Communists (Kungchantang). In Korea, divided between United States and Soviet commanders at 38° N. latitude, the country has been separated by a virtual blockade line along the inter-zone frontier. In Indonesia, the Philippines, Indochina, and (to a lesser extent) Malaya and Burma, wartime turbulence continued into 1946. Only Siam and Japan were quiet, orderly, and unified. Japan under MacArthur has been spared civil war, famine, and pestilence; the only major disasters were storms and an earthquake.

AUTHORITY OF SCAP

American policy toward occupied Japan was defined by a document entitled, "United States Initial Post-Surrender Policy for Japan," jointly prepared by the State, War, and Navy Departments and approved by the President, Sept. 6, 1945. This basic charter for SCAP applied throughout 1946. In essence, it declares that the United States desires to cooperate with the other Allies in the occupation of Japan, but that the United States assumes primary responsibility, and if the powers differ in their views of the occupation, "the policies of the United States will govern."

SCAP was installed as superior to the Japanese government. It was rigorously denied that the act of surrender had a contractual character or that the Allies' authority in Japan was limited except for such self-imposed limitations as they might apply. The Japanese were permitted to use their own government for purposes of administration; this was not a political right conceded to them but merely a convenience established by the Allies themselves.

The basic policy provided also for disarmament and demilitarization of the Japanese armed forces, trial and punishment of war criminals, removal of dictatorial and tyrannical laws and officials, encouragement of political freedom and responsibility, resumption of peaceful economic activity, and extirpation of militarism and ultra-nationalism from Japanese business, politics, thought, and social life.

These American policies were not initially ratified by the other United Nations. However, the creation of inter-Allied machinery extended a general international acquiescence in the authority and policies of SCAP.

INTER-ALLIED CONTROLS

The United States desired to avoid the appearance of unilateral action; it was at the same time necessary to avoid impeding occupation, since a slip in initial arrangements might have led to misunderstanding, catastrophe, or massacre. The United States pressed merely for a Far East Advisory Commission in the autumn of 1945. This functioned without USSR participation and was therefore unsatisfactory.

In December, 1945, the Moscow meeting of the Council of Foreign Ministers arrived at a working solution. A Far Eastern Commission was established. With members representing 11 of the governments which participated in war against Japan, it was designed to meet in Washington. Excluded from the scope of its authority were military problems and territorial adjustments. *De jure* policy-making, the Commission was in fact consultative. General MacArthur's authority over communications with Japan made it highly improbable that the Commission's investigators could operate in the field. The Commission itself visited Japan at the time of its transformation from FEAC to FEC.

Throughout 1946, the Commission met in the former Imperial Japanese Embassy in Washington, D. C. It was staffed by distinguished American and Allied experts, among them Sir George Sansom, the outstanding British authority on Japan. Any member might call for the review of any topic. Topics discussed with considerable effect were the elections, the political tone of the occupation, and the constitution.

Allied policy decisions concerning Japan move, therefore, through the following five steps: (1) the Far Eastern Commission may review or initiate policy which is communicated through (2) the United States Government to (3) the Supreme Commander for the Allied Powers, who may or may not consult with (4) the Allied Council for Japan, before relaying the policy to (5) the Imperial Japanese Government to be put into effect.

The Allied Council for Japan is a four-power body meeting in Japan. Its function has been overtly consultative. British, Dominion, Chinese, and Soviet comment have been offered frequently to General MacArthur. The Council has not had a broad scope of formal authority like that delegated to the Commission by participating governments.

MILITARY GOVERNMENT

Within Japan, General MacArthur maintained his HQ SCAP throughout the year. Communications from the United States Government are received through War Department or State Department facilities. Work on policy or supervision within the Headquarters is performed by nine staff sections: Economic and Scientific, Civil Information and Education, Natural Resources, Government (for supervision of the Japanese administration), Legal, Civil Intelligence, Public Health and Welfare, Civil Communications, and Statistical and Reports. In addition to these, General MacArthur has the nucleus of a normal military staff. Attached to his headquarters is the International Military Tribunal for the Far East; directly under him is the United States section of the prosecution staff, along with prosecutors from the other Allies, the International Prosecution Section.

The chief political adviser to SCAP is George Atcheson, an American career diplomat with long residence in the Far East, affable manners, and a capacity to speak forthrightly when aroused.

Underneath GHQ SCAP, the military government functions through the military commands of the occupying forces, chiefly the American Eighth Army. When action is needed at the provincial, prefectural, or local level, the appropriate command is transmitted to the Allied military officer on the spot. However, most activities are carried on by action of the Japanese government in Tokyo using its own facilities to instruct local and subordinate Japanese agencies.

PROCEDURE IN TRANSMITTING COMMANDS

The Japanese established a Central Liaison Office in 1945 for the express purpose of accepting commands from the Allies and routing them to the appropriate portion of the Japanese government for action. Normally, Allied commands go from this CLO to the appropriate ministry of the Japanese government, although occasional commands may need action by the Emperor, the Diet, or other agencies.

There has been no single instance of a direct Japanese refusal to obey an Allied command. There have been occasional protests from the Japanese, and occasional complaints from SCAP that specific directives, previously given, were not properly fulfilled. None of these led to a crisis.

THE POST-SURRENDER GOVERNMENT

Immediately following surrender, the Japanese were commanded to abolish all militaristic portions of the Japanese government, such as the High Command (Imperial Headquarters), Board of Marshals and Fleet Admirals, War Ministry, Navy Ministry, Office of the Lord Keeper of the Privy Seal, secret and special police. reservists and underground military organizations, and wartime economic controls.

The War Ministry was transformed into a First Demobilization Ministry; the Navy Ministry, into a Second Demobilization Ministry. In June, 1946. these were further reduced to Boards. They had the task of discharging repatriated Japanese military and civil personnel, and of mustering out the Japanese armed forces into civilian life in an orderly, recorded, official manner.

The Japanese government, during 1946, operated under the pre-war 1889 (Meiji) constitution, and in a juristic sense was the same government which had made war against this country. However, the constitutional and political changes prepared during 1946 led the way to drastic, thoroughgoing structural reforms in 1947. Even with the old machinery of state, the Japanese complied readily with Allied control.

THE EMPEROR

Though Hirohito ruled, his own proclamations changed the nature of his role. In two historic documents. the Japanese monarchy was transformed into a defined office with determinable political status.

On Jan. 1, 1946, Hirohito issued a rescript which reminded his people of the progress toward modernization and constitutionalization in the nineteenth century under his grandfather and then flatly disavowed his divine status: "We stand by the people and We wish always to share with them in their moment of joys and sorrows. The ties between Us and Our people have always stood upon mutual trust and affection. They do not depend upon mere legends and myths. They are not predicated on the false conception that the Emperor is divine and that the Japanese people are superior to other races and fated to rule the world."

The new constitution (see p. 111) provided that the Japanese Emperor should be recognized only as receiving his authority from the sovereign will of the Japanese people, added that the Emperor should act in political matters only with the advice and approval of the Cabinet, and that he should exercise no power not specifically assigned to him under the new provisions.

In his personal conduct, Hirohito complied with the spirit of the times. Instead of remaining aloof like an Asiatic god, he visited his people in their homes and on the street, traveling simply and unostentatiously. It was widely believed by Allied observers that Hirohito himself enjoyed the greater freedom which this new status gave him. An American woman (Mrs. Elizabeth Gray Vining) was taken into the Imperial Household to tutor the Crown Prince.

Retention of the Emperor has been wholly voluntary on the part of the Japanese people. The United States declaration of initial post-surrender policy made it plain that the Emperorship was to be abolished or reformed as the Japanese people might choose. Except for the Communists, the Japanese have almost unanimously chosen to retain the Throne while curtailing its "divinity" and privileges.

THE JAPANESE CABINET

Japan had only two prime ministers during 1946. The first post-surrender premier, Baron Kijuro Shidehara, continued in office until May 20th, when he resigned, to be succeeded by Shigeru Yoshida, another old-line official who had succeeded in avoiding the Allied purge lists. The election which led to this shift in premiers and reshuffle of the cabinets was held April 10. The delay was owing to the uncertainty of the official character of the Shidehara administration: was it a caretaker government designed to remain in office until a new constitution came into effect, or merely one more cabinet subject to fluctuations in popular opinion as reflected by the vote? The latter alternative was decided upon after Japanese political leaders protested against Shidehara's interpretation of his own role.

Parliamentary traditionalism in Japan thus proved to be stronger than Allied observers had dared to hope. In the technical sense of having monolithic authoritarian parties resting on fanatical dogma and asserting their authority above that of the state itself, Japan never did become fascist, even during the war. It had become a reactionary, semi-fascist, repressive constitutional monarchy. Hence the Japanese parties, though they failed to survive the war under their own names (except the Communist Party based in Red China), left a legacy which survived the partial, ill-meant but ineffective repressions of Tojo. Koiso, and the other wartime premiers. The cabinets of 1946 behaved much like their predecessors. Japan continued to change premiers more often than England but less frequently than France.

JAPANESE PARTY POLITICS

In the first post-war elections held in Japan, the people on April 10 elected a new Diet. It had been six years since the last previous use of political parties in a national election. All the pre-war parties had been legally consolidated in 1940 into the Imperial Rule Assistance Association, superseded in 1942 by the Imperial Rule Assistance Political Society. This was abolished in 1945 upon surrender.

The new elections were criticized by Soviet and Leftist commentators because it was alleged that the post-war parties were mere fronts for the wartime cliques which had existed within the "unified" wartime party. General MacArthur and the United States Government took the view. however, that the Japanese had to learn freedom by using it practically and that nothing was to be gained by keeping an unrepresentative group in control and ruling solely through Imperial edict. In a sharply worded reply to the Far Eastern Commission (March 29), General MacArthur pointed out that further delay would not necessarily liberalize the election.

The results of the election and behavior of the Diet appear to have justified General MacArthur's position. The five major parties emerged as follows in terms of parliamentary seats: Liberals, 141; Social Democrats, 93; Progressives, 92; Cooperatives, 16; and Communists, 2. There was also a large number of splinter parties, some of which had higher representation than the Communists, but who could not compare with the Communists in popular influence, party discipline, and rigorous fanaticism.

The Liberals and Progressives represented the conservative elements. The Social Democrats, weakened somewhat by schism, held the middle Left. The Communists appealed to the extreme Left. The extreme Right was suppressed by order of General MacArthur. For the first time, a Women's Party took part in an election.

For the remainder of 1946, most observers believed a swing to the left to be taking place. In the absence of national elections this was difficult to demonstrate. The Communists remained both vociferous and effective.

THE NEW CONSTITUTION

SCAP and the Japanese political leaders both frankly confessed that 1946 was merely a transition period. Hopes for real political democratization were pinned upon the new constitution. The meeting of the Diet concerned with the constitution was the longest such session in Japanese history (June 20-Oct. 12).

Progress toward the new constitution was started on Oct. 11, 1945, when SCAP indicated to the Japanese government the Allied expectation that fulfilment of the Potsdam terms would involve a "liberalization of the constitution." The Emperor ordered establishment of a Constitutional Problem Investigation Committee. A

Japanese government draft appeared on March 6, 1945 and was generally approved by all sectors of Japanese public opinion except the Communists. This draft included five main points, which were retained throughout further drafts and are in the new constitution as it now stands: 1. Redefinition of the powers of the Emperor; 2. Renunciation of war; 3. Provision of a bill of rights; 4. Abolition of the former House of Peers and its replacement by a House of Councillors; and 5. Reform of the judicial structure.

Eight months were required for the detailed discussion of the points of the new constitution. Additional safeguards were installed. A few matter-of-fact commentators objected that no new constitution was needed, since the spirit and not the letter of the law created democracy, and, if properly interpreted, the 1889 constitution, still in effect, could be construed to be democratic. The Communists continued to object to the timing, content, and intent of the new constitution.

The final draft was approved by solemn procedure and was proclaimed by the Emperor Nov. 3, 1946. It is to go into effect April 3, 1947.

NEW CONSTITUTIONAL GOVERNMENT

The new constitutional government will retain the Emperor but with strictly limited powers. He will continue to have a minor utility, as does the British king, in appointing incoming prime ministers, but most of his governmental and all his Shintoist functions are taken from him. Sovereignty is explicitly declared to rest in the people, not in the Emperor.

The bill of rights guarantees the Japanese everything which the 1889 constitution assured to the people. The most important provision is equal rights for women. The usual well-meant but vague provisions concerning freedom of property, collective bargaining, freedom of occupation, etc., so common in twentieth-century constitutions, are also included, giving the document a mild Socialist tinge.

The House of Councillors emerges with considerable resemblance to State Senates in the United States. The House of Representatives is made more flexibly parliamentary and is given undisputed primacy in the government.

The principle of Cabinet responsibility is adapted squarely from the British model. Both the premier and the cabinet ministers must be selected from among members of the lower House.

The judiciary is given the power of review on constitutional grounds, a provision which will be somewhat unrelated to the general tradition and background of Japanese administrative law.

Criticism of the constitution involved the point that the document sounded as though it had been translated from English, and bore little resemblance to the kind of institution on which the Japanese themselves would rely. Defense of the document involved reference to its ready amendment and to the fact that China and the USSR both possessed elaborate democratic constitutions and nevertheless appeared able to operate their governments in manners peculiar to themselves.

RENUNCIATION OF WAR

The most striking provision of the new constitution is its renunciation of war. Article IX is the first enactment of its kind by a modern sovereign state, declaring:

"War, as a sovereign right of the nation and the threat or use of force, is forever renounced as a means of settling disputes with other nations. The maintenance of land, sea and air forces, as well as other war potential, will never be authorized. The right of belligerency of the state will not be recognized."

Critics, including the celebrated liberal constitutional jurist Dr. Minobe, were quick to point out that the provision seemed as noble as it was impractical and that even Japan had a right to exist.

DEMOCRATIZATION

Apart from disarmament, demilitarization, and governmental reform, democracy in Japan was sought through the elimination of propaganda, opening up of free news facilities, promotion of education, liquidation of reactionary cartels and combines, encouragement of labor unionism, and land reform. American policy generally took into account the fact that, if Japan were to become truly democratic, the change would have to occur from within the Japanese mind.

Among the United Nations, debates concerning Japanese democratization chiefly involved the degree of depth to be reached. The Communists and other Left-liberals urged that social and economic reform of a thoroughgoing order had to underlie political and educational reform; conservatives and self-styled realists advocated the remedy of Japan's worst social abuses, but held that social revolution would lead only to totalitarianism of the Left replacing totalitarianism of the Right.

TRIALS AND PURGES

To remove the malign influence of Rightist extremism, the Allied powers placed the major Japanese militarists on trial before the International Military Tribunal for the Far East. The latter part of 1946 was concerned with the trial. Local trials in southeast Asia and elsewhere had meanwhile disposed of cases having only regional interest; in Manila, two Japanese generals, Yamashita and Homma, were put to death.

Within Japan, SCAP has issued repeated directives designed to purge from positions of honor, trust, influence, or profit all Japanese who led the militarist drive for war. Business, publications, schools, government, and the professions are alike to be closed to ultra-militarist and nationalist elements. Concurrently, positive steps are being taken to build up free institutions, including the press.

NEWSPAPERS

Three newspapers now practically blanket Japan. *Asahi,* with a 3,200,000 circulation in three cities, supported the Democratic Front (union of Social democratic Left and the Communists). *Yomiuri Hochi,* formerly the house organ of militarism, is now sympathetic to the Communists; its November (1946) circulation was 1,800,000. The *Mainichi* pursued its traditional middle course and retained a 3,000,000 circulation in Osaka and Tokyo. The leading Japanese newspaper is *Akahata,* 300,000 circulation, which appears every three days. The official Domei news agency and the government propaganda monopoly of radio were both dissolved and were replaced by facilities having a more normal commercial basis.

EDUCATION

At the invitation of General MacArthur, an Education Mission arrived in Japan in March. Its report recommended decentralization of educational administration, introduction of parent-teacher associations, extension courses, and free libraries. It also recommended relinquishment of the traditional Chinese ideographic script.

The report supplemented the routine educational reform which had been supervised by SCAP. A continuous process of screening teacher staffs to eliminate militarist, fascist, or other Rightist elements continued. The use of geography, morals, and Japanese history textbooks was suspended until suitable material could be printed. SCAP helped the Japanese to get the new democratic texts out punctually. All restrictions on the use of library books were removed.

The textbook program was generally approved by observers, but the teacher purges were considered inadequate. By Sept. 30, 1946, only 107 teachers out of the 200,000 examined had been removed.

ZAIBATSU

Zaibatsu ("wealth-clique") is the Japanese term applied to the class of monopolist entrepreneurs who led Japan from feudalism to modern industrialism and thence to war and to destruction. All shades of Allied opinion desired removal of the great Japanese cartels, such as the family-trusts of Mitsui and Mitsubishi; administrative and policy difficulties arose when the question came up of how far capitalism itself was to be broken down or fragmented.

Official American policy was directed against the Zaibatsu in terms of ownership combines, not as private individuals. The Japanese capitalists, realizing that their trusts were to be broken up, submitted a voluntary plan for liquidation to the Japanese government. The Yasuda group presented the plan not only on its own behalf but spoke for Mitsui, Sumitomo, and Mitsubishi as well. A Mission on Zaibatsu was sent out to Japan by the War Department. It reported to SCAP in March. Various specific financial procedures were recommended to supplement the Yasuda report, which proposed in essence that holding company shares be taken over by the government and paid for through the use of blocked bonds. Since even bank accounts have been limited to scheduled withdrawals, this provided a basic check.

On April 20, 1946, the Japanese government promulgated a Holding Company Liquidation Commission ordinance, providing standards for liquidation of the combines; on Sept. 30, the Commission took over the affairs of Mitsui, Mitsubishi, and Yasuda. The list of examined and scheduled companies grew throughout the year. It was anticipated that such companies would be reconstituted through sale of shares for suitable operating units to be public.

LABOR UNIONS

To balance up the other end of the economic scale, Allied policy, through SCAP, undertook the encouragement of labor unions in Japan. The imitation-totalitarian Labor Front (Sangyo-hokoku-kai) of 1940 was dissolved. Wartime ordinances providing for illimitable mobilization and for a forced "Volunteer Corps" were also cancelled.

The Japanese are credited by historians with a talent for combination. They showed this throughout 1946 in the constant multiplication of labor organizations, in the brisk activity shown by workers in fighting for higher wages, and in the novelty of the devices employed by labor in strikes. One of these was "production control." When a given mine or factory went on strike, the workers, instead of stopping production, undertook the management of the plant and sought to break all previous production records as a means of making the management "lose face" while retaining public opinion in favor of the strikers. Since this in effect separated capital from ownership, even though initially on a temporary basis, it amounted to grass-roots socialism. It was informally prohibited by an expression of SCAP disapproval on June 10, but the Japanese Diet evaded the responsibility of legislating against it and left to the first new constitutional Diet of 1947 the responsibility of framing a precise legal code for the definition of strikes.

Organizationally, the most important confederation of Japanese labor unions is the Japanese Congress of Industrial Organizations which in October had an estimated membership of 1,600,000. Closely connected with the Communist Party and controlling only a small minority of Japanese labor, it held the great Hokkaido coal strike. Its future appeared uncertain.

LAND REFORM

Feudalism, as a legal institution, had been abolished by Japan in the 19th century. A majority of the farmers remained closely bound to the land by indebtedness or by outright tenancy. One of the forces behind Japanese militarism before Pearl Harbor was the appeal which the Army had for impoverished farmers. Their discontent made them listen to fascist-type promises of prosperity. Accordingly, farm maladjustment has been not merely an economic problem but a political one as well.

SCAP and the Japanese government undertook elaborate negotiations on the subject during the winter and spring of 1945-1946. The Japanese proposals seeming insufficient, SCAP asked the advice of the Allied Council. The Soviet member recommended confiscation of all landholdings above a certain size, without remuneration. SCAP held that this violated due process of law and was therefore undemocratic.

In September, the Japanese Diet finally passed a land reform act of the type desired by the Allies with the exception of the Russians. The law provided for public assistance to farmers in making land purchases, limited the size of holdings, cut down absentee ownership, and established local boards in each community to proceed with the practical business of underwriting purchase of land by specific Japanese families.

GENERAL ECONOMIC CONDITIONS

For a country which has been bombed, burned, blasted with atomic bombs, defeated, surrendered, and occupied, Japan did relatively well. No widespread starvation occurred. Inflation was continuous, though it never reached breakneck speed. A shortage of raw materials prevented part of the existing plant facilities from operating; uncertainty concerning reparations, Japan's post-war trade, the length of the occupation, the financial future, and the price controls kept many additional facilities away from full exploitation. Toward the end of the year, American unofficial observers commented that the Japanese authorities appeared, in many cases, to acquiesce in bad economic conditions because they could then call upon the Allies either to remedy the conditions or to withdraw.

REPARATIONS

Initial Allied directives involved the closing or sequestration of arsenals and other military plants immediately following surrender in 1945. Since Japan was heavily militarized, this involved setting aside extensive facilities for destruction or for removal by reparations. The vast Japanese developments in Manchuria were carried away or wrecked by the Soviet authorities.

Additional Japanese reparations remained a moot question. Interim plans failed to enumerate the factories specifically enough to release the others to free, confident Japanese enterprise, nor were questions of sharing settled between the Allies themselves. General MacArthur, by November, had designated about 1,100 plants for seizure, 660 of which were currently working on orders for the occupation authorities.

At the end of the year, reparations policy was still on the agenda of the Far Eastern Commission in Washington.

DEFENSE AND FOREIGN POLICY

In 1946, Japan had no independent defense facilities and no separate national foreign policies. The questions of Japan's future defense and future diplomacy had not been taken up by any responsible public official.

REPUBLIC OF THE PHILIPPINES

By BERNABE AFRICA

UNDER SECRETARY OF FOREIGN AFFAIRS, REPUBLIC OF THE PHILIPPINES

THE HISTORICAL ASPECT

The similarity in the dates of the proclamation of the independence of the Philippines and of the United States—July 4—will be noted, but the similarity ends there. While the fight for American independence was bloody, that for the Philippines was bloodless. On July 4, 1946, Manuel Roxas, President of the Republic of the Philippines stated: "The President of the United States has proclaimed our independence. The Republic of the Philippines has now come into being, under a constitution providing for a government which enthrones the will of the people and safeguards the rights of men. This historic event has been completed."

They were significant words for they summarized the historical process accompanying the emergence of the first new independent state from the vast colonial regions of southeast Asia. These words could also be taken as a tribute to America's enlightened colonial policy and tutelage.

REHABILITATION AND RECONSTRUCTION

The Philippines to which President Sergio Osmeña returned in September, 1944, was one of ruin and desolation. Dramatic evidences of the tremendous loss of life and property greeted the President's eyes. Historical landmarks and public buildings had been razed to the ground; public projects were irreparably destroyed; the people were homeless, in rags, and hungry. Assisted by the United States Army, President Osmeña's Administration began the back-breaking task of rehabilitation and reconstruction. From March, 1945, when President Osmeña completed the formation of his cabinet, the reestablished Commonwealth Government restored peace and order, faced the delicate issue of collaboration, and tackled the problem of immediate relief of the masses in prostrated areas.

President Sergio Osmeña was at the head of the reestablished Commonwealth Government in Manila from February 27, 1945 to May 28, 1946. He faced two problems. One involved the formulation and execution of policies designed for rehabilitation and reconstruction; the other his candidacy for the presidency against General Manuel Roxas. From January to July 3, 1946, President Osmeña's Administration was subjected to the compelling demands of relief for the people and the necessity of planning a long-range program for their welfare. At the same time, in anticipation of independence, it had to attend to the preliminary work incident to the relations of the Philippines with foreign countries.

REPRESENTATION IN UN GENERAL ASSEMBLY

Philippine Resident Commissioner Carlos P. Romulo was authorized by President Osmeña to represent the Philippine Commonwealth in the first regular session of the United Nations General Assembly held in London, January, 1946. The Philippine membership in the International Civil Aviation Organization was approved by President Osmeña on March 21, 1945.

UNITED STATES COOPERATION

The multiple aspect of the outstanding problems faced by the Osmeña Administration was not unknown to the United States Government. There were several outspoken critics in the Islands and abroad of the methods pursued by the Commonwealth in the handling of such issues as rehabilitation and relief and the collaboration issue. President Truman himself, however, issued a significant announcement on Feb. 15, declaring that his government had adopted a "hands-off" policy in connection with Philippine political affairs.

At the same time, the American Government helped in the training of Filipinos so that they could subsequently be assigned to Philippine diplomatic missions and consular offices. The Office of Foreign Relations gave examinations for Filipino foreign service *pensionados* in accordance with a plan of the U. S. Department of State. The State Department also handled the grant of scholarships to 15 Filipino students who would study in American colleges and universities, pursuing courses along fields that would help in the early adjustment of Philippine economy.

In March, the standard of living in the Philippines was relieved by the arrival of more than 100,000 sacks of rice from the United States. The Emergency Control Administration—later replaced by the Philippine Relief and Rehabilitation Administration—handled the distribution of the rice, in addition to its duties of giving essential commodities to the needy.

LABOR DIFFICULTIES

In the industries, the social consciousness of the masses as in other countries, manifested itself. Faced with the high cost of living and desirous of better treatment, workers in government corporation and private firms, and even dock workers connected with the United States Army, walked out. The months of February and March saw the rise of strikes. The shipping strike in Manila temporarily tied up the unloading of cargo on piers and caused a logjam. Government employees also felt the rise in living costs. President Osmeña responded to the clamor of government workers by releasing 5,000,000 pesos in March as bonuses for them. He also signed the bank bill, setting aside 10.000.000 pesos for the rehabilitation of local banks.

FILIPINO WAR VETERANS

The problem of the Filipino war veterans also came to the fore. Filipino and American high officials worked and are still working for the grant of benefits to the veteran who fought in Bataan and Corregidor, suffered in the jungles and mountain fastnesses during the enemy occupation, and helped the American troops liberate enemy-held areas. United States High Commissioner Paul V. McNutt, speaking at the guerrilla convention in Camp Murphy early in 1946, repeated assurances that the United States Government was going to extend aid to members of the Filipino war veterans. At the end of that month, the Military Police Command was transferred to the Philippine Commonwealth by the United States in anticipation of the grant of Philippine independence.

WAR CRIME EXECUTIONS

As a piece of poetic retribution, General Tomoyuki Yamashita, last commander-in-chief of the Imperial Japanese Forces, was hanged in Laguna province on Feb. 23, 1946, while General Masaharu Homma, first commander-in-chief of the Imperial Japanese Forces, who was directly responsible for the infamous "death march" from Bataan after its fall. was executed in April. These executions came as a direct result of the trials held by the U. S. War Crimes Commission which had been going on for some months in Manila. During the first three months of 1946, the Philippine Government continued mopping up operations against thousands of Japanese stragglers in the wilderness of Luzon. By the year's end, practically all Japanese had been captured and interned.

NATIONAL ELECTIONS

The bitter struggle for presidential power, which has simmered since the Commonwealth Government was reestablished, began with the proclamation of the candidacies of Senators Manuel Roxas for president and Elpidio Quirino for vice-president. Both represented the Liberal faction of the Nacionalista Party. The candidates for the other wing of the same party were President Osmeña and Senator Eulogio Rodriguez.

The results of the national elections held on April 23, 1946 showed that the Filipinos had repudiated President Osmeña. The Roxas-Quirino ticket won the election by more than 200,000 votes, and obtained a majority in both houses of Congress.

PHILIPPINE TRADE ACT

On May 1, President Truman signed the Philippine Trade Act of 1946 and the War Damage Act. The first, sponsored by Representative C. Jasper Bell of Missouri, provided for trade relations between the United States and the Philippines, imposing quotas on Philippine principal exports free of duty for eight years, beginning 1946, and thereafter imposing a graduated 5 per cent duty yearly, beginning in 1955; and allowing Americans the same rights as the Filipinos in the exploitation of natural resources and operation of public utilities; the second, sponsored by

Senator Millard Tydings of Maryland, provided for the compensation of war damage and the restoration and improvement of public property and essential public services in the Philippines.

AMERICAN LOAN

The first week of May saw the proclamation of Manuel A. Roxas as president of the Republic of the Philippines. On May 8, he left by airplane with High Commissioner McNutt for the United States for a conference with President Truman and other key American officials on the problems confronting the Philippine Republic after the grant of independence on July 4. Upon his return in June, he repeated the necessity of a $400,000,000 American loan to the Philippines, which he said was so economically crippled that it could not possibly hope to avert the tide of disaster unless helped financially.

INAUGURAL OF PRESIDENT ROXAS

President Roxas was inaugurated on May 28. In his inaugural address he reiterated the loyalty of the Filipino people to the American flag and urged continued relations with the United States on friendly terms and for mutual advantage. He emphasized the two aspects of Philippine freedom: the Philippine Republic was face to face with the harsh fact of a ruined and bewildered world in search of peace and security from war; it was challenged by social insecurity, hunger, unemployment, internal disorder, disrupted educational institutions, and paralyzed communications.

He declared that "a new era has come to the Orient" and that the Philippines is committed to the cause of world peace and to follow the international program of the United States; today, he added, "the concept of independence is overshadowed by the dynamic growth of international interdependence." He minced no words in presenting the broad social problems confronting an independent Philippines and said that only work and more work by the people could save the people from want.

Because of these facts, he took the first steps regarding the international relations of the new Republic. He signed Republic Act No. 1 creating the Department of Foreign Relations.

TREATIES WITH THE UNITED STATES

On the day that the Philippines was granted her independence, she entered into a treaty of general relations with the United States, under which the latter agreed, among other things, to recognize the independence of the former as a self-governing nation and to represent the interests of the Republic in the countries where there are as yet no Philippine representation. Other treaties and agreements since then have been concluded between the two countries, among them the copra and oil agreement, and that providing for the transfer without cost to the Philippines of United States surplus property with a book value of over 1,000,000.000 pesos; and the Philippine Military Assistance Act, passed by U. S. Congress on July 31, 1946 and accepted by the Philippines, giving to the latter certain equipment, supplies, material, and technical advice on condition that the Philippines will not transfer or dispose the same without previous consent of the United States nor disclose any information concerning the same.

Vice-President Quirino and F. S. Tomlinson, British Chargé d'Affaires of the British Consulate General in the Philippines, exchanged notes in August and September regarding the succession of the Philippines to the United States in the ownership and administration of the Turtle and Mangsee islands north of Borneo after giving one-year notice beginning on Sept. 19, 1946 as stipulated in the treaty between the United States and Great Britain in 1932.

An air pact with the United States, pledging reciprocal air landing facilities to the airstrips of both countries, was concluded.

MILITARY AND NAVAL BASES

Negotiations for the grant of military and naval bases to the United States were also taken up in a long series of conferences between high Filipino and American officials since July 4, and details were taken up by Ambassador McNutt with President Truman in the early part of December. A mutual agreement on the matter is expected to be reached by next year, since details only remain to be worked out.

GOVERNMENTAL ORGANIZATION AND APPOINTMENTS

Vice-President Elpidio Quirino wa appointed Secretary of Foreign Affairs on June 29, 1946. The Department of Foreign Affairs was organized with Dr. Bernabe Africa as Under Secretary. Dr. Carlos P. Romulo was appointed early in July to represent the Philippines in the United Nations General Assembly Joaquin M. Elizalde was named Philippine Ambassador to Washington a few days later. In early September, José P. Melencio was named Philippine Consul General in New York, and in November Judge Roberto Regala was appointed Philippine Consul General in San Francisco

Three months after the recognition of the American embassy and consulate general's office in the Philippines, Chen Chih-Ping was recognized by the Philippine Republic as Chinese minister. Gaston Willoquet who previously represented France as chargé d'affaires was raised by his government to the rank of minister in November. Linton Harry Foulds was recognized as British minister to the Philippines in the last week of October. Dr. Vittorio Strigare was recognized as Italian chargé d'affaires in November.

APPOINTMENT OF UN DELEGATES

Philippine participation in the United Nations General Assembly was reinforced by President Roxas when he appointed on Nov. 1 Senators Mariano J. Cuenco, Pedro Hernaez, Representatives Raul Leuterio and Lorenzo Sumulong as Philippine delegates to the General Assembly to assist chief Philippine delegate Carlos P. Romulo. A week later, Senators Proceso Sebastian, Salipada Pendatun, Representative Francisco Ortega, Dr. Gabriel Mañalac, and Dr. Encarnacion Alzona were named to compose the Philippine delegation to the United Nations Educational and Scientific Conference in Paris on Nov. 21, 1946.

RELATIONS WITH THE UNITED STATES

As President Roxas has rightly said, the Philippines as a member of the family of free nations could not afford to isolate herself. He has repeatedly advocated close and intimate cooperation with the foreign policy of the United States. "As we turn to build the foundations of our Republic," he declared in a radio broadcast to the United States, "and establish economic and diplomatic relations with all the other free nations of the earth, we are pledged and will remain pledged to the maintenance of friendly ties with America as the cornerstone of our foreign policy."

FOREIGN POLICY

In another address he elaborated this thesis and said: "We will be as wholehearted as any nation in our devotion to the ideals of an indivisible peace and indivisible world. We will maintain with all our strength and all our power our obligations to the United Nations and to the causes set forth in the United Nations charter to which we are a signatory. In the same way, we will maintain friendly and honorable relations with all our neighbors and look forward to the day when peace and security will be maintained by mutual consent and by the collective conscience of mankind."

INDUSTRIAL RECONSTRUCTION

First and foremost of these problems was rehabilitation. The two bills passed by the United States Congress—the Bell Trade Act and

War Damage Act—are expected to go a long way in the reconstruction of what has been destroyed or damaged during the war. Even then, at the year's end, a move was under way to correct the deficiencies and inequalities contained in these two measures.

To meet the pressing need of rehabilitation and reconstruction of war-destroyed industries as well as their expansion, the Congress of the Philippines passed a bill approved by President Roxas on Oct. 29, creating the Rehabilitation Finance Corporation. The capital of this corporation has been placed at 300,000,000 pesos. This capital will be taken from the resources of the Government's Agricultural and Industrial Bank and from the balance of the surplus property turned over to the Philippine Government by the U. S. Army. The Rehabilitation Finance Corporation will lend capital to businessmen and government entities which are self-liquidating and wish to engage in any enterprise in the free and open market. The beneficial effect of this gigantic corporation on the national economy cannot be overestimated. Observers predict that, when the corporation starts operation, the hum of activity in trade, commerce, and industry will start.

WAR PROFITS TAXES

To raise much needed revenue, and penalize war profiteers during the Japanese occupation, the War Profits Tax bill became a law in September. The law taxes persons who have accumulated property between Dec. 8. 1941 and Aug. 4, 1945 in excess of 6,000 pesos. A 50 per cent tax is placed on property in excess of 6,000, but below 50,000 pesos; 60 per cent on that in excess of 50,000, but below 100,000; 70 per cent in excess of 100,000, but below 300,000; 80 per cent in excess of 300,000, but below 500,000; 90 per cent in excess of 500,000 but below 1,000,000; and 95 per cent in excess of 1,000,000.

PUBLIC MARKET STALLS

Republic Act No. 37 gives preference to Filipino citizens in the renting of public market stalls in order to encourage Filipinos in the small-scale retail trade and to enable them to better compete with aliens in the retail merchandising field. Aliens in the Philippines control about 75 per cent of the volume of domestic trade today. The intent of the law is to see that more of the Philippine business should be in Filipino hands. According to this act, the aliens have until Dec. 31, 1946 to hold their present public market stalls. However, if there should not be enough Filipinos to apply for the stalls now held by aliens, the latter may continue to hold the same until Filipino applicants register for them. The act took effect on Jan. 1, 1947.

PHILIPPINE GI BILL OF RIGHTS

The President approved late in 1946 Republic Act No. 37 known as the "Philippine GI Bill of Rights." This law created the Veterans Board and set aside ₱20,000,000 to meet veterans' claims. Among the benefits to be derived from the local counterpart of the GI Bill of Rights are: 1) payment of tuition fees and book allowance for veterans at government expense; 2) hospitalization for the sick and disabled; and 3) priority in the distribution of public lands by the National Land Settlement Administration; and 4) credit from any banking institution to be guaranteed by the Government.

NATURAL RESOURCES AND PUBLIC UTILITIES

The parity question, or the grant of equal rights to Americans in the development of the natural resources and in the operation of public utilities, was discussed with much heat by administration leaders and the minority party at the close of the year. This concession was the result of the executive agreement entered into between the Presidents of the United States and the Philippines pursuant to a provision of the Philippine Constitution. The provisions of the Philippine Trade Act of 1946, known as the Bell Act, were approved as a constitutional amendment by the Congress of the Philippines and called for a plebiscite on March 11 1947 to adopt or disapprove such amendment. The equal rights provision of the Trade Act of 1946 is Section 341—"Rights of United States Citizens and Business Enterprises in Natural Resources" which states: "The disposition, exploitation, development, and utilization of all agricultural, timber, and mineral lands of the public domain, waters, minerals, coal, petroleum, and other mineral oils, all forces and sources of potential energy, and other natural resources of the Philippines, and the operation of public utilities, shall, if open to any person, be open to citizens of the United States and to all forms of business enterprises owned, controlled, directly or indirectly, by United States citizens."

UNEMPLOYMENT

By the end of 1946, the unemployment problem taxed the minds of high government officials. The withdrawal of many U. S. armed forces units from the Philippines and the demobilization of Philippine Army personnel were factors that added to the aggravating problem. The reorganization of the government was expected to be finished by early next year.

MAINTENANCE OF PEACE AND ORDER

Another problem of pressing importance is that relating to the maintenance of peace and order. In a land that has been overrun by the enemy and where, as a result, looting and plunder have been regarded as virtues to be prized, it was not easy to restore internal peace and reestablish a reign of law and order, especially in view of the thousands and thousands of firearms held by unauthorized individuals, weapons which had been distributed freely and indiscriminately by American troops to Filipinos during the liberation. In Central Luzon, dissident elements known as *Hukbalahaps* paid little or no attention to the appeal of the Government to surrender their arms. Contrary to the opinion prevailing in some quarters, especially in some sections of the American press, the peasant elements in Central Luzon, from whose ranks the *Hukbalahap* organization has grown, are definitely not in revolt against the Government nor is the pacification campaign directed against them. The Government started its social justice program to alleviate the economic injustices, which have plagued the Filipino peasants for centuries, by outlining and putting into effect the purchase of big landed estates for eventual redistribution to tenants. The Administration, in cooperation with the Congress of the Philippines, has undertaken reforms in agrarian legislation, one of which is the revision of crop-sharing by allotting 70 per cent of the crop to tenants and 30 per cent to landlords.

Complex as the problems are which face the Republic of the Philippines, President Roxas' Administration is confident that it will ultimately emerge victorious in the struggle for reconstruction and in its efforts to provide the most ample opportunity to the masses of the people for a better economic and social life. The Republic of the Philippines knows that it faces another year of readjustment but is confident that conditions will improve and the terrible scars of a war-ravaged land will be slowly effaced.

THE UNITED STATES AND LATIN AMERICA

By Graham H. Stuart
Professor, Stanford University

GOOD NEIGHBOR POLICY

During 1946 it appeared that the good neighbor policy instituted by President Franklin D. Roosevelt in 1933 and maintained with considerable success throughout the period of the Second World War had begun to deteriorate. The failure of the United States to bring about a cooperative relationship with Argentina was undoubtedly the principal cause of the unsatisfactory development. In a radio broadcast in January, 1946, Assistant Secretary of State Braden, speaking on the subject "What Is Our Inter-American Policy," declared that the United States does not favor a policy of unilateral intervention but one of joint action. For that reason we approved the proposal of the Foreign Minister of Uruguay which declared that notorious and repeated violations of human rights by any country endangered the peace and was a matter of concern to other countries. In other words we felt that collective multilateral action was justified after full consultation.

It soon became evident that the other Latin American states were not enthusiastic over intervention of any sort and consequently the conference, which was scheduled to meet early in 1946 to make the Act of Chapultepec into a permanent treaty, was indefinitely postponed. However, in its relations with the Latin American Countries other than Argentina, the United States continued to make every effort to retain their confidence. For example, when Assistant Secretary of State Braden was chosen Chairman of the Governing Board of the Pan American Union he refused to accept on the ground that the principle of rotation which had been determined upon at the Rio Conference should be instituted immediately. As a result Dr. Antonio Rocha, the Special Ambassador of Colombia to the Pan American Union, was elected Chairman of the Board.

U. S. RETURN OF MILITARY AND NAVAL BASES

Another effort to strengthen the confidence of the Latin American states in United States fair dealing was the returning of military and naval bases acquired for the protection of the continent during the war. The long delay in the peace negotiations and the failure to end the war legally gave rise to a fear lest the United States might take advantage of the situation to retain these strategic areas. The bases in Brazil were of considerable size and importance and, as an evidence of her policy, the United States had returned all of them to Brazil by the end of 1945, and by Feb. 1, 1946, with the return of Salinos to Ecuador, all military bases on the South American mainland had been given back. The base in the Galapagos Islands, of vital importance in the protection of the Panama Canal, was retained until July 1 when the last of the American forces were withdrawn. The El Pato air base in Talara, Peru, was returned Oct. 29, 1946.

On May 20, 1946, the last of the military bases in Cuba, including the San Antonio de los Baños air base near Havana, valued at about $20,000,000, was turned back, thus leaving only the Guantanamo Naval Base which has been held ever since Cuba obtained her independence. In June, the United States turned over to the Nicaraguan government the $2,000,000 naval base at Corinto and at the same time offered a huge amount of surplus property in exchange for a tract of land suitable for a new United States Embassy. In the first nine months of 1946 the United States had turned back to Panama some 71 defense sites and promised to return 27 more before the end of the year.

INTER-AMERICAN MILITARY COOPERATION

For many years the United States had been sending military and naval missions for instructional purposes to those Latin American countries that requested it. This policy was actively pursued during the Second World War, and in February, 1946 the United States had 17 military missions in 13 Latin American countries. The program still holds, and in June, 1946 a military mission was sent to Venezuela and in October a naval commission to Colombia. The military aviation mission to Bolivia, arranged for in 1941, was renewed early in 1946. Under the authority of the Surplus Property Act, the Navy continued to send small ships and planes to Latin American countries even after the war was over. However, the Second World War showed that still greater coordination was necessary, and in the Conference on Problems of War and Peace, held in Mexico City in October, 1945 by the terms of the Act of Chapultepec, a mutual assistance pact was signed which obligated the member governments to assist one another to meet an attack or threat of aggression from any source whatsoever. It was further agreed that the pact would be implemented by the creation of a permanent military agency which would be charged with the preparation of proposals for a closer military collaboration among the republics.

In accordance with those agreements President Truman, on May 6, 1946, submitted a bill to the Congress authorizing a program of military collaboration with the other American states, including the training, organization, and equipment of the armed forces of those nations. The Inter-American Defense Board had recommended that it was highly desirable to standardize military organization, training methods, and equipment. The act permitted the Army and Navy to prepare a continuous general program, to provide additional training activities, and it authorized the President to transfer military and naval equipment by sale or otherwise to the countries participating.

On May 29, Secretary of State Byrnes appeared before the Committee on Foreign Affairs of the House of Representatives and declared that the Act of Chapultepec placed upon each of the American republics a responsibility to collaborate in the common effort to maintain the peace and security of all the Americas. This act was designed to permit the United States to play its part effectively in the general cooperative undertaking.

Although the seventy-ninth Congress came to an end without passing the bill, the War Department expected to have it re-introduced in the eightieth Congress. It felt that effective defense of the Panama Canal against such new agencies of warfare as the atomic bomb and guided weapons would require close military cooperation with the American Republics within 1,000 miles of the Canal Zone in every direction.

The only noticeable opposition to the bill from Latin America appeared in *La Epoca* of Argentina, which declared President Truman's plan to furnish arms and instructors for all Latin American armies anti-national and aggressive. Nevertheless in June, former Chief of Staff Carlos von der Becke visited the United States to discuss military cooperation. He was apparently given a friendly reception by Generals Eisenhower and Brett, but on June 18 the Department of State told General von der Becke that the way to get arms from the United States was to get rid of Nazis in high places. In fact, so long as Argentina refused to cooperate wholeheartedly in hemispheric defense, the Department of State felt that military aid to her might endanger the United States.

ECONOMIC COLLABORATION

The United States continued its financial and economic assistance throughout 1946. In the first six months, the Export Import Bank loaned over $15,250,000, largely to Brazil, Colombia, and Mexico. Mexico also requested a loan of $20,000,000 in order to purchase United States equipment for an electrification program. Chile wanted a credit of $3,400,000 for petroleum exploration and $13,000,000 for refining installations. Negotiations were conducted with Peru for a $30,000,000 credit; Ecuador wanted $4,000,000 for a new water supply; Nicaragua wanted a similar sum for an agricultural bank. In a supplementary lend lease arrangement, Brazil obtained $1,000,000 worth of industrial equipment and the same amount in ordnance and air force equipment.

TRADE AGREEMENTS AND INVESTMENTS

Among the commodity arrangements was a very important one with Cuba signed July 22, 1946, which would amount to over $2,000,000. The United States contracted to purchase the 1947 Cuban sugar crop of about 4,500,000 tons at 3.675 cents a pound with the possibility of a raise if the cost of living should rise. It was also agreed that the United States would purchase the 1947 crop of from 5,000,000 to 5,500,000 tons at the highest 1946 price. In addition, the United States agreed to purchase a substantial amount of industrial alcohol and blackstrap molasses.

The Department of State, through Assistant Secretary Braden, emphasized the necessity of private capital again playing a more important role in the development of the Americas, and pointed out that "except in the crisis of war, government, with manifest exceptions, does not belong in business other than for legitimate and essential regulation or cooperation." In an effort to eliminate fears of economic imperialism under the guise of big business he specifically declared that the State Department "disapproves and opposes most strongly any intervention in local political affairs by American businessmen or companies."

There were many indications that private business proposed to follow Braden's suggestion. The United Fruit Co. expected to spend $15,500,000 for new properties in Central America and to make large increases of its banana plantations in Costa Rica, Guatemala, Honduras, and Panama. The company is also completing the largest banana growing project in Latin America in the Dominican Republic at a cost of approximately $20,000,000. The United States Rubber Co. announced a doubling of its investment in Latin America. Republic Steel planned to develop its rich and extensive iron ore properties in Mexico. Johns-Manville announced the establishment of asbestos production factories in the Latin American countries, including Mexico, Argentina, Brazil, and Colombia. Sears Roebuck Co. scheduled the opening of three new stores, one in Mexico and two in Brazil, an investment of $7,000,000.

INCREASED SHIPPING FACILITIES

Perhaps the greatest business expansion from the north was in transportation. The Grace Line planned a new fleet of twenty "Santa" ships to the Caribbean and west coast of South America and its *Santa Luisa* sailed on Sept. 30 on its maiden voyage. Meanwhile it proposed to charter 20 ships until the fleet of post-war "Santa" vessels was completed. Biweekly runs to Venezuela, Colombia, and Curacao were to replace the pre-war weekly runs. Lykes Brothers Steamship Co. inaugurated a new service to operate regularly from Mobile, Ala. to the South American west coast. Standard Fruit and Steamship Co. resumed its New Orleans Panama Canal freight service on Oct. 18. Shepard Steamship Co. announced plans for a new freight service between the United States east coast ports and South America. The Alcoa Steamship Co. planned to offer an improved service in the Caribbean and to east coast ports with the installation of 16 modern United States flagships.

EXPANSION OF AIR TRANSPORTATION

An even greater expansion of transportation by airplane was inaugurated. The United States, through the Civil Aeronautics Board, authorized new and extended routes to nine airlines covering routes to Mexico and points south: American, Braniff, Chicago and Southern, Colonial, Eastern, National, Western, Pan American and Pan American-Grace, including a new trunk line to Rio de Janeiro and Buenos Aires by Braniff Airways in competition with Pan American. Pan American outlined a program for a multiple daily "aerial commuter service" to all Latin American capitals which would carry 2,000,000 passengers annually and move 30,000,000 pounds of freight. Braniff Airlines announced that, by Jan. 1, 1947, it hoped to establish routes to 10 Latin American countries, including Bolivia, Brazil, Cuba, Colombia, Ecuador. Panama, and Peru. Panagra announced that New York–Santiago, Chile flight time would be cut to 40 hours, 15 minutes, and that it would extend its DC-4 service from Lima, Peru to Santiago, Chile. Avianca (Colombian Air Lines) began flights in December between Bogota, Barranquilla, and Miami, and Venezuela Airlines connected New York with Caracas *via* Havana. The airplane had placed the United States nearer than Europe to South America.

CULTURAL COOPERATION

The United States continued to expand its cultural cooperation activities. In the fiscal year 1945-46, the Department of State made grants-in-aid to send 47 American professors to American republics and brought seven Latin American professors to the United States. The United States Government also assisted in the maintenance of 27 independent and 20 branch cultured centers in the American republics. These centers served as important channels for scientific and cultural interchange between the people of the United States and those of Latin America, although the teaching of the English language to Latin Americans and Spanish and Portuguese to North Americans is the principal activity of these centers. The establishment of a representative library was also a vital factor in intercultural relations. In as much as cultural attachés have been assigned to most of our embassies and legations in Latin America, it is possible to direct the activities of a cultural nature so that the maximum results may be achieved.

RELATIONS WITH ARGENTINA

For the second consecutive year Argentina played the principal role in the relations of the United States with her Latin American neighbors, and the relationship was most unsatisfactory. The United States felt that Argentina was flagrantly violating the commitments made both at the Mexico Conference and at San Francisco, and the Péron government was blamed for this failure. On Jan. 17, 1946, the United States Chargé d' Affaires, John M. Cabot released to the Argentine press documents captured in Germany, proving that German money had financed the pro-Péron newspapers *El Pampero–Cabildo* and *Deutche La Plata Qeitung,* and he pointed out that the editors and staff of *El Pampero* were now the publishers of *La Epoca,* Péron's chief political organ, but this was a mere trial balloon.

On Feb. 12, 1946, 12 days before the presidential elections in which Péron was a candidate, at the order of Assistant Secretary of State, Braden, there was issued by the United States Government a memorandum on Argentina—the so-called Argentina Blue Book. Here in 131 pages of documented proof, largely from the files of the German Foreign Office, all of the top Fascist Argentine officials—Farrell, Péron, Ramirez, Castillo—were seriously implicated in a conspiracy with the Nazis to undermine the governments of the neighboring South American countries. It was conclusively proved that Colonel Péron and his aids had provoked a successful pro-Nazi revolution in

Bolivia and had almost succeeded in Chile. The Colonel's clique had furnished both political and economic aid to the enemy, had protected German agents, had permitted the German Embassy to subsidize pro-Nazi newspapers, and had allowed some 200 Nazi-controlled schools to remain open until late in 1945.

This "second atomic bomb" aroused mixed emotions in South America. *"La Prensa"* of Argentina expressed shame at the revelations, while *La Epoca* called the publication intervention and imperialism. The Péron group denounced the publication as an attempt to smear Péron on the eve of elections and aroused the patriotic nationalism of the people by shouting "Péron or Braden." Even the democratic papers, while conceding that the actions of Argentina were deplorable and inimical to continental solidarity against the Axis, were worried over the aspect of intervention and the time of publication.

The election results showed the unwisdom of the publication of the Blue Book. In a free election guaranteed by the army with the largest vote in Argentina's history cast, Juan Péron defeated José Tamborini by 1,479,000 to 1,210,000 popular votes but by the much more overwhelming electoral vote of 304 to 72. Apparently the Argentine people so resented outside interference that they supported a Fascist pro-Nazi government, for Péron won both houses of their Congress by large majorities.

Under the circumstances the United States could do nothing but accept the verdict although it brought Uncle Sam's prestige to an all-time low. Secretary of State Byrnes on April 8 declared that the United States would welcome Argentina into the fold if she would fulfill her promises under the Act of Chapultepec and clean up Axis influences. Foreign Minister Juan Cooke declared that the statements in the Blue Book were ridiculous and that Argentina had ousted the Nazis. The Péron press was more bitterly sarcastic and suggested that Byrnes and Braden be dismissed and a good neighbor ambassador sent to Buenos Aires.

Apparently the United States was a bit uncertain as to how to proceed. George Messersmith, who had served as Ambassador to Cuba, then to Mexico and previously as Assistant Secretary of State, was sent to Buenos Aires to cultivate more friendly relations. At the same time, Spruille Braden, Péron's bitter antagonist, remained as Assistant Secretary of State in charge of Latin American relations. Although General von der Becke was unable to obtain much satisfaction in his quest for arms in the United States—he was refused supplies until Argentina rid herself of Axis elements —the United States agreed to release approximately $700,000,000 Argentina gold frozen in the United States. Although Ambassador Messersmith seemingly proved himself *persona grata* with Péron it was announced in the press late in October that a presidential decree had freed Luding Freude, listed by the Blue Book as No. 1 Nazi, absolved him of all charges of espionage, and returned to him all his properties and funds. Early in December another Fascist named in the Blue Book, José Figuerola, was declared by Péron as administrator of Argentina's five-year social-military plan.

Shortly afterwards Ambassador Messersmith was recalled to Washington for consultation, and at the end of the year it was not clear whether Braden or Messersmith would prevail in the State Department's policy towards Argentina.

THE UNITED STATES AND THE MIDDLE EAST

By Vernon McKay
Research Associate, Foreign Policy Association

INTERNATIONAL RIVALRIES

Strategic considerations and oil resources gave the Middle East great prominence in 1946 as an area of international rivalries. Britain sought to reconcile imperial strategy with Arab nationalism, apparently basing this policy on the premise that Britain must have Arab friendship if it is to retain the strength and prestige of a major power. For Zionist aspirations in explosive Palestine, the British hoped to find a solution compatible with this premise. The French, resentful of their forced departure from Syria and Lebanon, and fearful of widespread discontent among the Arabs of North Africa, struggled to devise a new colonial system that would restore France's prestige as an imperial power. Meanwhile the influence of the Soviet Union and the United States in the Middle East became increasingly evident, with Washington showing a tendency to back Britain as a bulwark against Russian expansion. Although aggressive toward Iran and the Dardanelles, Moscow was cautious in the Arab states, leaving Britain and the United States to suffer the consequences of their Palestine policies. The Russians expressed concern for both Jews and Arabs, while extending their propaganda activities in the Arab world by publishing, in Arabic, writings which eulogized life among the 23,000,000 Moslems in the Soviet Union.

In an address delivered Sept. 19, Loy W. Henderson, Director of the Office of Near Eastern and African Affairs in the Department of State, declared that the main objective of the United States in the Near and Middle East is "to prevent rivalries and conflicts of interest in that area from developing into open hostilities which eventually might lead to a third world war." To achieve this objective, he said "our primary policy . . . is to take whatever measures may be possible and proper to promote directly and indirectly the political and economic advancement of the Near and Middle Eastern peoples and to support in that area the principles of the United Nations."

PALESTINE PROBLEM

Jewish terrorism reached new peaks of violence in Palestine, but further proposals to solve the problem were unsuccessful. The publication on April 30 of the 4,000 word report of the 12-member Anglo-American Committee of Inquiry marked a greater American role in the search for a solution. The ten recommendations of the report favored the Jews to the extent of suggesting removal of the 1939 British White Paper restrictions on Jewish immigration and land purchases, but struck at the heart of Zionist political aims by advocating that Palestine "be neither a Jewish nor an Arab State." The American Zionist Emergency Council, spokesman for 600,000 Zionists, was joined by other leading Jewish groups in approving removal of the White Paper restrictions but attacking the longer-range proposals as an infringement of Jewish rights. The Arabs promptly attacked the report by calling a protest strike of an estimated 1,000,000 people on May 3 in Palestine, Syria, and Lebanon. At various times thereafter the Arabs threatened to resort to arms, to refuse oil and other commercial concessions, to seek Russian help, to appeal to the United Nations, and to assault Jewish communities in other Arab states.

In recommending that 100,000 Jews be transferred to Palestine "as rapidly as conditions will permit," the Committee of Inquiry unanimously endorsed a suggestion made by President Truman eight months earlier. The President, in a statement accompanying publication of the report on April 30, expressed himself as very happy at this step, but declared that "the report deals with many other questions of long range political policies and questions of international law which require careful study and which I will take under advisement." British Prime Minister Attlee asserted the following day, however, that his country would take no action until it could "ascertain to what extent the United States will be prepared to share the resulting additional military and financial responsibilities."

In July came a significant new development—revival of the idea of partition of Palestine between Jews and Arabs. Dr. Chaim Weizmann, President of the Jewish Agency, declared on July 9 that partition "must not be rejected as a possible solution." New Anglo-American discussions beginning in London on July 12 produced the Morrison-Grady Provincial Autonomy plan which would have divided Palestine into four areas under a British central administration. This too proved unacceptable to both Arabs and Jews. The Jews objected both to the small size of the proposed Jewish Province and to the fact that the British would retain control of immigration. Some Zionists continued to demand the whole of Palestine, but Dr. Weizmann on Aug. 16 informed the British that the Jewish Agency would discuss partition if the establishment of "a viable Jewish state in an adequate area of Palestine is the purpose of the discussions."

Invitations to a new conference in London were rejected, however, by both Jews and Palestine Arabs. When this conference opened on Sept. 9, representatives of the Arab League states were the only parties present to deal with the British. The Arab answer to the Morrison-Grady plan was a counter-proposal advocating a provisional government of seven Arab and three Jewish ministers until the establishment of Palestine as an independent unitary state not later than Dec. 31, 1948. A legislature would be created in which Jewish membership would total not more than one-third, while any future Jewish immigration would require the approval of a majority of the Arab members of the legislature. Late in September the British adjourned the conference temporarily. President Truman expressed his regret at this action on Oct. 4, and called for immigration at once without waiting for a solution of the Palestine problem. The United States, he declared, "is ready to lend its immediate assistance." Sharp conflicts of opinion broke out among the Jews at the World Zionist Congress meeting in Basle, Switzerland in December, but the Congress closed on Dec. 24 with a reaffirmation of Zionist principles and a refusal "in the existing circumstances" to join in new Palestine talks scheduled for January, 1947 in London.

ARAB LEAGUE POLITICS

The Council of the youthful League of Arab States (Egypt, Syria, Lebanon, Iraq, Saudi-Arabia, Transjordan, and Yemen) held three sessions in 1946, the most publicized of which was an extraordinary session at Bludan, Syria, June 8-13. The Bludan delegates adopted a comprehensive ten-point program to defend the Arab position on Palestine. They also reiterated the League's support for Egypt's demand for evacuation of British troops and for union of the Anglo-Egyptian Sudan with Egypt; agreed to do their utmost to win independence for the former Italian colonies of Cyrenaica and Tripolitania; and agreed to work for the complete independence of other Arab countries (meaning the French and Spanish possessions in North Africa).

A boycott of Palestine Jewish products by the seven states of the Arab League was inaugurated on Jan. 1, 1946. Although it was chiefly significant as a political move enhancing hostility between Arab and Jew, the Palestine Government's trade figures for the first quarter of 1946 revealed that, while Palestine's exports were 31 per cent greater in value than exports for the same period in 1945, trade with the boycotting countries fell from one-fourth to one-twentieth of the total. According to an estimate based on Jewish industrial production for 1944, however, only 4.6 per cent of the total Palestine production is exported.

The Arab League states demonstrated their unity and intensity of purpose in fighting foreign domination of Arab lands, but contented themselves with planning rather than action in carrying out the second aim announced in the League's charter, namely, the promotion of economic and social development. The cultural committee of the League proposed a draft treaty for a unified educational system, including the exchange of students and teachers, and the development of museums and research. The committee on commerce, agriculture, and industry agreed that the Arab states should develop trade and communications, exchange commercial representatives and information; encourage tourists; establish chambers of commerce and industrial exhibits, fairs, and institutes; coordinate technical and scientific research; and unify Arab weights and measures. Other committees discussed the possibilities of a postal union, a customs union, a common citizenship and passport system, and a unified communications system. The Charter of the League requires, however, that such committee plans must be approved not only by the Council but by the individual states.

EGYPT

In Egypt, leading state in the Arab League, there were sporadic outbreaks of anti-British violence by nationalists who demanded withdrawal of British troops and incorporation of the Anglo-Egyptian Sudan into Egypt. The Cairo administration negotiated throughout the year for revision of the Anglo-Egyptian treaty of 1936, which authorized the maintenance in Egypt of 10,000 British troops and 400 Royal Air Force pilots with auxiliary personnel. Egyptian negotiators were continually embarrassed by irresponsible violence on the part of extremists in the political opposition at home. A cabinet crisis in February 1946 culminated in the resignation of Prime Minister Nokrashy Pasha's coalition government on Feb. 15. With considerable difficulty, 71-year-old Sidky Pasha formed a new ministry which, in turn, fell in December when Nokrashy Pasha returned to power. No treaty was completed, but Britain was reported to have accepted in principle the demand for withdrawal of its troops. On the Sudanese question, however, Britain insisted that the people of the Sudan should have the right to determine their own future, while Egypt continued its demands for recognition of Egyptian sovereignty. Sudanese opinion was divided between two factions, each claiming about 2,000,000 followers. One group sought independence for the Sudan while the other joined in Egypt's demand for "unity of the Nile valley."

IRAN AND THE BIG THREE

Outside the Arab states, the interests of the Big Three came into conflict in two other Middle Eastern countries—Iran and Turkey. The Iranian crisis was precipitated by an Iranian appeal to the United Nations Security Council on Jan. 19 for removal of Russian troops from the northern Iranian province of Azerbaijan, where a leftist revolt had culminated in the creation of an autonomous republic in defiance of the central government at Teheran. Russia was interested in acquiring oil concessions in Azerbaijan and in establishing a "friendly government" in an area bordering the U. S. S. R. Despite Gromyko's "walk-out" on March 27, 1946, during Security Council discussions of the problem, the Council refused to remove the Iranian appeal from its agenda. Meanwhile, negotiations between the Soviet Union and Iran produced an agreement for withdrawal of Russian troops and an oil concession to Russia, subject to approval by the Iranian parliament. The oil agreement, published April 8, provided for the formation of a joint Soviet-Iranian oil company with a 50-year concession, at the end of which Iran could either buy up the Russian holdings or extend the period of the joint company's operations. On May 23, the Moscow radio announced that all Russian troops had been withdrawn from Iran by May 9.

In May, it thus appeared that while the Soviet Union had withdrawn its troops from Iran, it had achieved its objectives of acquiring an oil concession and establishing a "friendly government" in Azerbaijan. As the end of the year approached, however, a striking new development came. With the Russians showing no signs of intervention, Iranian Premier Ghavam dispatched government troops into Azerbaijan, driving out the rebel government and restoring his own authority on Dec. 13. The Iranian parliament had yet ratified the oil agreement with Moscow.

TURKEY AND THE STRAITS

Another sharp difference between Russia and the West arose over the long-standing problem of controlling the Straits which link the Black Sea with the Mediterranean. At the Potsdam Conference in August, 1945, the Big Three had agreed in principle upon the revision of the Montreux Convention of 1936, which had given Turkey the right to remilitarize the Straits and had turned over to the Turkish government the functions of the international commission that had governed the Straits since 1923.

It was on August 7, 1946, almost a year after the Potsdam Conference, that the Soviet Union submitted to the Turkish government five proposals for revision of the Montreux Convention. The first three of these proposals dealt with the passage of commercial and naval vessels through the Straits, and coincided with American views. Opposition of the Western powers was aroused, however, by two additional Soviet requests designed to realize Russia's historic aim of controlling the Straits. The Soviet Union asked that the administration of the Straits be placed in the hands of "Turkey and the other Black Sea Powers," and that Turkey and Russia should "organize by joint means the defense of the Straits." The United States government, in a note handed to Russian Chargé d'Affaires, Fedor Orekhov, responded that "Turkey should continue to be primarily responsible for the defense of the Straits," and also rejected the Soviet proposal for control of the Straits by the Black Sea powers. Control of the Dardanelles, the American note suggested, "should be brought into the appropriate relationship with the United Nations."

After consultations with the United States, Britain, and France, the Turkish government on Aug. 22 rejected the Soviet proposals. Moscow answered on Sept. 24 by warning that, if Turkey were to take military measures in the Straits in common with certain non-Black Sea powers, this step would be considered to be a clear contradiction of the security interests of the Black Sea powers. Accepting the principle that an international conference should decide the problem, the Russian note maintained that the summoning of such a conference should be preceded by direct conversations between Russia and Turkey. Britain, however, notified the Russians on Oct. 9 that it could not agree to direct Russo-Turkish negotiations and saw no need for or purpose in continuing direct correspondence, but that His Majesty's Government was ready to attend an international conference to consider revision of the Montreux Convention.

DEADLOCK ON THE ITALIAN COLONIES

The political and strategic rivalries of the great powers were also strikingly demonstrated in the dispute over the disposition of the Italian colonies. After nearly a year of shifting proposals and counter-proposals to solve this problem, the Big Four Foreign Ministers could agree only on taking the colonies from Italy and postponing for another year the decision on their future.

It is of interest to note that the independence of Transjordan, formerly a British mandate, was formally announced in Amman on May 25 when the Emir Abdullah was acknowledged as King. Moreover, the last contingents of French troops withdrew from the newly independent states of Syria and Lebanon during 1946. On Sept. 19, King Abdullah, on returning from a visit to the Regent of Iraq, announced that Iraq and Transjordan were planning to form a union. These steps toward Arab freedom had significant repercussions in North Africa where the Arabs of Libya continued to demand independence and those under French rule expressed mounting discontent.

OIL AND MIDDLE EASTERN POLITICS

Although the strategic location of the Middle Eastern states at the crossroads of three continents would make them an area of great power rivalry even if they had no oil resources, the existence of rich oil deposits accentuates this conflict. In the background of the political disputes over the area in 1946 were a series of multi-million dollar international oil deals. The Standard Oil Co. of New Jersey and the Socony-Vacuum Oil Co. made arrangements to receive a share of the oil produced both by the Anglo-Iranian and Arabian-American companies (The Texas Co. and the Standard Oil Co. of California control Arabian-American). The British Government, which is the majority stockholder in Anglo-Iranian, contends that the agreement with the two American firms is purely a "commercial proposition." On Dec. 28, it was reported that the Iranian parliament will probably ratify the oil agreement with Russia, but that many Iranians favor inviting American oil interests into southeastern Iran in order to counterbalance Soviet influence.

STRENGTHENING OF U. S. MIDDLE EAST TIES

Many steps were taken by the United States in 1946 to strengthen its ties with Middle Eastern countries. Payne Field in Cairo, the largest and most modern air base in the Middle East, was formally turned over to the Egyptian Government on Dec. 15, but American civil aviation was assured full rights to use the airport, and American military aircraft were assured transit rights for six months with possible renewal thereafter. Meanwhile, the United States Army was developing the large airport of Dhahran on the Persian Gulf coast of Saudi-Arabia as the most important American air base in the Middle East.

The growing importance of the Middle East in American opinion was also signified by the strengthening of our diplomatic relations with the Arab countries. The United States legations in Egypt and Syria were elevated to embassies; the joint mission to Syria and Lebanon was terminated when Washington decided to appoint separate ministers to these two countries; and diplomatic relations were inaugurated with Saudi Arabia and Yemen.

THE FOREIGN SERVICE OF THE UNITED STATES

By Selden Chapin

Director General of the Foreign Service, State Department

THE FOREIGN SERVICE ACT OF 1946

The Foreign Service of the United States underwent a fundamental reorganization in recent months as a result of the passage, by the Seventy-Ninth Congress, of the Foreign Service Act of 1946. This act, which is the basic legislation for the Foreign Service as it operates today, represents a great advance from the point of view both of personnel management and administration.

It gathered together all previous legislation in one basic charter. It set up five basic groups of personnel: Ambassadors and Ministers, Foreign Service officers, Foreign Service Reserve officers, Foreign Service staff officers and employees, and alien personnel. This was a very important step, for the structure of the Foreign Service, through the addition over a period of years of various small categories, had become complex, difficult to administer, and in some cases inequitable.

The act also set up a new pay scale, bringing to date pay scales some of which had previously been set in 1855. The legislation also provided authority for the payment of needed allowances for Foreign Service personnel living abroad, in addition to the already existing representation and cost of living allowances. The new allowances included a transfer allowance, a maintenance allowance for residences of principal officers abroad, and the authority to reimburse expenses resulting from illness or injury incurred in line of duty.

In order to provide for a more highly trained Foreign Service, the bill established a Foreign Service Institute which, like the Army and

Navy Staff Colleges, will train Foreign Service personnel progressively through their careers. The bill also provided that personnel should receive home leave after two years abroad, as compared with the former requirement of three years, and specified that three of the first 15 years of service of each Foreign Service officer must be spent in the United States.

In addition the new legislation set up a promotion-up and selection-out procedure by which it was hoped to keep Foreign Service officers developing continuously and to prevent the accumulation of personnel who had passed their peak of performance.

DUTIES OF THE FOREIGN SERVICE

The Foreign Service of the United States on December 31, 1946, numbered approximately 11,000 persons including ambassadors, ministers, Foreign Service officers, Foreign Service Reserve officers, Foreign Service staff officers and employees including clerks and guards, alien clerks and employees, and consular agents.

The officers and employees of the Foreign Service protect the interests of the United States in accordance with treaties and international law, and advise, protect, and assist American citizens resident, traveling, or having interests abroad. They seek to prevent or to correct practices which might discriminate against the United States or its citizens.

They negotiate treaties, conventions, and protocols regarding international intercourse, tariffs, shipping, commerce, and the preservation of the peace in accordance with the instructions of the Secretary of State and the President. They observe, analyze, and report on significant political, social, and economic conditions and trends in the country to which they are assigned. Since an important function of the Foreign Service is the promotion and protection of the foreign trade of the United States, trade inquiries, trade disputes and market conditions are the subject of numerous communications.

AMBASSADORS AND MINISTERS

Ambassadors and ministers are appointed by the President by and with the advice and consent of the Senate, some being career members of the Foreign Service and others appointed from private life. In January 1947, about 60 per cent of the ambassadors and ministers were appointed from the career Foreign Service.

Historically, embassies headed by ambassadors were maintained in the larger foreign countries and legations in smaller countries. In recent years. however, the United States has maintained embassies in all the other American republics and in some of the smaller countries abroad, so that the size or importance of a country no longer necessarily determines whether a minister or ambassador is appointed

Ambassadors and ministers receive salaries in four classes depending upon the salary classification of the post to which they are assigned. These classes are $25,000, $20.000. $17,500. and $15,000. In addition, they receive allowances which vary from post to post and from year to year.

FOREIGN SERVICE OFFICERS

Foreign Service officers are appointed by the President, by and with the advice and consent of the Senate Normally candidates take both written and oral examinations, and upon successfully passing these examinations are placed upon the eligible list from which the President makes nominations to the Senate. Under certain circumstances individuals may be appointed Foreign Service officers after serving specific periods of time in either the Department of State or in other branches serving in the Foreign Service.

Foreign Service officers are usually commissioned both diplomatic and consular officers and, aside from those who may be Chiefs of Mission (Ministers or Ambassadors) hold the titles of Minister,* Counselor, First, Second, and Third Secretary, Consul General, Consul or Vice Consul. according to their rank and the posts they occupy. It is usual for officers to have both consular and diplomatic titles simultaneously if they are assigned to an embassy or legation.

Except for officers who qualify for appointment after serving abroad either in the Reserve or Staff branches or in the Department of State, all Foreign Service officers start in Class 6, the lowest class. Salaries range from a minimum of $3,300 in Class 6, to a $13,500 maximum in Class 1 and the Class of Career Minister. Depending upon the post and its duties, Foreign Service officers serving overseas may receive, in addition to their pay, allowances for rent, cost of living, and representation. Promotion is determined on the basis of merit with a certain time in grade required in each class. Foreign Service officers are expected to progress through the grades, and a "promotion-up or selection-out" system is now in effect which automatically retires officers who fail to win promotion within a stipulated number of years. The age of retirement is normally 60, and upon retirement an officer is provided with an annuity, out of an annuity fund toward which he has contributed 5 per cent of his salary.

During an officer's career in the Service he is expected to serve where he is needed in positions for which he is deemed best qualified. Officers are utilized interchangeably in consulates, diplomatic missions, and in the Department of State, and are normally moved from one post to another and from one position to another every few years.

FOREIGN SERVICE RESERVE OFFICERS

Foreign Service Reserve officers are appointed by the Secretary of State for non-consecutive periods of not more than four years each. They may be assigned from other government agencies or from private life, and are appointed to any one of the six classes of Foreign Service Officers appropriate to their age, qualifications and experience. They must have outstanding qualifications of a specialized nature. Normally they specialize in economic, cultural, agricultural or other types of work requiring experience and special training.

---

* Certain senior Foreign Service officers are appointed to the class of Career Minister when their duties are such as to be comparable with those of an ambassador or minister. Examples are the second ranking officer at the American Embassy in London, the Consul General in Shanghai, and the directors of certain offices in the Department of State, all of whom hold the rank of minister.

Included in this category at the present time are a number of public affairs, cultural relations, and information officers. These officers may hold diplomatic titles such as Counselor, First, Second or Third Secretary or Attaché, and they handle informational and cultural work for their chiefs of mission.

FOREIGN SERVICE STAFF OFFICERS AND EMPLOYEES

Foreign Service staff officers and employees include all personnel other than Foreign Service officers and Foreign Service Reserve officers. They are appointed by the Secretary of State without special examination, appointments being based upon age, qualifications and experience. This group includes administrative officers and assistants, disbursing and accounting personnel, clerks, receptionists, code clerks, file clerks, guards, couriers and translators.

Members of the staff corps receive annual salaries according to a scale of 22 classes with a top of $10,000 and a bottom of $720. The usual starting pay of clerical personnel is $2,160 in Class 14. Staff corps members receive the same leaves of absence as Foreign Service officers, and also receive certain allowances depending on their duties and the conditions at the posts to which they are assigned.

ALIEN CLERKS AND EMPLOYEES

Alien clerks are appointed in the field, and salaries are determined by the local rates prevailing. The category includes clerks, translators, interpreters, custodians, messengers, chauffeurs, porters, doormen, guards, janitors and charwomen, electricians, telephone operators, gardeners, investigators, watchmen and maintenance men.

ADMINISTRATION OF THE FOREIGN SERVICE

The Foreign Service is administered by the Director General of the Foreign Service who is appointed by the Secretary of State from among Foreign Service officers in the Class of Career Minister or Class 1. He is assisted by a Deputy Director General, and the Office of the Foreign Service, a part of the Department of State. Within the Office of the Foreign Service there are six divisions: The Division of Foreign Service Personnel, the Division of Foreign Service Administration, the Division of Foreign Service Planning, the Division of Foreign Service Reporting, the Division of Training Services, and the Division of Foreign Buildings Operations.

The Board of the Foreign Service is an interdepartmental board charged with making recommendations to the Secretary of State concerning the functions of the Service. Policies and procedures governing the selection, assignment, rating and promotion of Foreign Service officers fall within its province as well as those governing the administration and personnel management of the Service. The Board is made up of three Assistant Secretaries of State, the Director General of the Foreign Service, and representatives from the Departments of Agriculture, Commerce and Labor.

DISSOLUTION OF THE LEAGUE OF NATIONS

By Arthur Sweetser
Chief, Washington Information Office, United Nations

"THE LEAGUE HANDS OVER"

Amidst the kaleidoscope of dramatic events which crowded the world's stage during 1946, one of the most permanent and far-reaching was the final and very orderly replacement of the League of Nations by the United Nations. During that twelve-month, the international agency which had grown out of the

First World War became history, while that which had grown out of the Second World War entered upon its detailed activities. The passage from one to the other was accurately, even nostalgically, conveyed in the title which the League authorities chose for their final pamphlet: "The League Hands Over."

The details of this transition were complicated. What to do, for instance, with the League's superb buildings and equipment at Geneva, with its staff and personnel, with the obligations entrusted to it in countless treaties, with special problems such as mandates, and finally with its own Covenant now superseded by the Charter? How fit into the situation the two greatest members of the United Nations, the United States and Soviet Russia, one of which had sponsored but never joined the League and the other had joined but subsequently been declared no longer a member?

These problems were taken up one by one, in separate committees of the two agencies, in occasional joint committees, and ultimately in the respective Assemblies. As a result of steady, cautious, and conciliatory negotiations extending over the whole year in London, Geneva, and New York, a very satisfactory transfer was made; the League was able to "hand over" with appropriate solemnity and dignity; and the United Nations was given the advantage of the League's remaining assets and resources.

THE UNITED STATES POSITION

The United States was in a curious situation during these discussions. Initiator of both agencies, it was called upon, as a leading member of the United Nations, to take a decisive part in the termination of the League of Nations which it had never joined. The reversal in America's policy towards world organization between 1920 and 1946 was most succinctly expressed by President Truman, when, standing on the rostrum before the delegates of 51 nations at the inaugural session of the General Assembly in New York on Oct. 23, he said: "After the First World War, the United States refused to join the League of Nations and our seat was empty at the first meeting of the League Assembly. This time the United States is not only a member; it is the host to the United Nations."

This statement was received with close attention. It was recalled with even closer interest when, two weeks later, another national election reversed the political control of Congress, as it had with such awesome consequences in 1918. Opinion was widespread, however, that there would not be this time the same sharp reversal of foreign policy as had thrown the United States into isolation in 1920. Instead, it was generally agreed there would be a continuation of the bipartisan approach initiated by President Roosevelt, maintained by President Truman, and fully shared by responsible Republican leaders. The American people had learned through two world wars that they could not find safety in isolation; they had dedicated themselves to the opposite policy of international cooperation.

The American Government, during 1946, took the position of leadership in the United Nations which in 1920 she had denied herself in the League of Nations. American delegations were present in all fields of international action. The year opened with American attendance at the first part of the General Assembly of the United Nations in London and closed with her continued attendance at the second part in New York. The United States contributed nearly three-quarters of the immense sum needed for the emergency work of the United Nations Relief and Rehabilitation Administration; welcomed the World Bank and Fund and the United Nations Food and Agriculture Organization when they established headquarters in Washington; took an active part in the United Nations agencies for civil aviation and for educational, scientific, and cultural cooperation; and, in the two pre-war agencies associated with the League of Nations, continued its membership in the International Labor Organization and assumed membership in the International Court of Justice. In all fields of international cooperation, the United States pursued an active policy in sharp contrast to that following the First World War.

It was natural, then, that, when questions arising from the dissolution of the League of Nations and the transfer of its functions and assets came before the United Nations, the United States, though a non-member of the League, should take part. This began in the Executive Committee of the Preparatory Commission in London, continued through the plenary Commission and the Assembly sessions in London and New York, and carried over into the committees constituted to negotiate with the League, Swiss, and Dutch authorities. It was explained as follows in a comprehensive article, "Transition from League of Nations to United Nations," by Henry Reiff in the *State Department Bulletin* (April 28 and May 5, 1946):

"The United States, as an important member of the United Nations, as a party to numerous separate treaties referring to the League or entrusting to it various non-political and technical functions, particularly those dealing with the control of narcotics, and as having displayed as a non-member of the League considerable interest in its humanitarian and economic work, particularly in the fields of health and women and children, was represented on each of these United Nations committees."

TRANSITION NEGOTIATIONS

The spirit of these negotiations, which the American representatives shared equally with representatives of League Member States, was well expressed by Mr. Rieff. "It was necessary," he said, "to effect a transition of limited scope between a general international organization about to be liquidated and a general international organization in process of being constituted. In the generation since World War I the functions, activities, powers, and duties of the League had proliferated amazingly both under the Covenant and in pursuance of several hundred separate treaties." While "it was agreed that, wherever possible, the United Nations should within its competence facilitate a dignified and speedy dissolution of the League," there was "a strong current of belief that undignified or inconsiderate treatment of the interest of the League and its members could hardly redound to the credit of the new Organization to which the loyalties of many governments and individuals were being transferred."

Many weeks passed in these negotiations. They eventually resulted in a "Common Plan for the Transfer of League of Nations Assets" approved by the United Nations Committee and the League's Supervisory Commission. This plan transferred to the United Nations the material assets of the League, which, with the Rockefeller Library and other gifts, totaled around 50,000,000 Swiss francs, and made other necessary provisions. It was accepted without change by the United Nations General Assembly in London on Feb. 12, 1946.

THE LAST ASSEMBLY'S CHALLENGE

On April 6, the twenty-first and last Assembly of the League came together in Geneva. Its purpose was not only to consider this Plan, dissolve the League, and transfer its assets to its successor; it gave many of the delegates the occasion to look back nostalgically at what might have been and forward hopefully at what could be. No American representative was present, however, at this last session to meet the question in many minds as to how different world history might have been if America had at the outset taken her place in the agency which she had formed. Instead, there stood outside, in the calm and tranquillity of the Court of Honor, a memorial to Woodrow Wilson, former President of the United States and the generally accepted founder of this first world agency for peace.

The Assembly concluded with a challenge for the future. Its spirit was perhaps best expressed in the final Report presented by Sean Lester, who had held to his post as Acting Secretary General throughout the war years and who was confirmed as Secretary General as from Sept. 1, 1940. His summation, repeated in different words by many delegates, opened as follows:

"The peoples of the world, searching for means to avoid the inhumanity and folly of war constantly becoming more terrible and destructive, made a covenant and a league of peace. They did not keep the covenant; they broke the league; and a new war smashed across Europe and leaped the oceans. Aggression and ambition, on one side, timidity of Governments and short-sighted vision of the peoples themselves, on the other, led straight to the catastrophe.

"The League of Nations as an organisation no doubt had faults, but it is dangerous nonsense to say that war came because of those faults. The League did not fail; it was the nations which failed to use it. That is the lesson of the last ten years and it is a vital and terrible warning for the next ten years. The old League of Nations is going and the new League takes the centre of the world's stage. Whether, in many respects, it is better than the machine which is being discarded is not the most important thing. Success will depend on how it is used, on the justice, wisdom and courage of leaders and, above all, on the vision and determination of the common people. Such truisms cannot be too often repeated in view of the immensity of the task which again faces humanity. The new generation of builders and makers must not be misled into thinking that any defect in the ideals or organization of the League of Nations was the cause of humanity's tragic failure. That failure was due rather to the statesmen and peoples of the League of Nations that contented themselves with lip-service, that could not face the lesser sacrifices to avoid the greater, and to those peoples and States which foolishly imagined they could be lookers-on."

The League Assembly confirmed the "Common Plan," and on April 19 the League became history. "The League," said the Assembly's President, Carl J. Hambro, "is handing over to the new body which has sprung from its loins and is to take over the work and traditions, made richer by the great adventure, made bolder by League timidity, wiser by League failures, and stronger by League frailty."

THE TRANSFER

Thereafter events moved rapidly. On July 19, 1946 representatives of the two agencies, League and United Nations, signed an agreement elaborating the details of transfer. On Aug. 1, the actual title to the superb buildings which the League had built on the shores of Lake Geneva finally passed, and this property became part of the United Nations. On that same date, also, 115 remaining officials of the League and many of its activities were transferred to the United Nations, the latter including Communications and Transit, Economic Intelligence Services at Geneva and Princeton, Opium Advisory Committee, Library Service, and Treaty Registration. On Aug. 8, the League's Secretary General notified all States Members that "The Treaty Registration Service of the Secretariat of the League of Nations was closed on July 1, 1946," and that future ratifications or registrations should be addressed to the United Nations; on Aug. 26, that all reports and information on the drug traffic should henceforth be sent to the United Nations; on Oct. 1, that as of August, the League "had had no further responsibility for activities in connection with communications and transit"; and on Oct. 16 that the League's health activities, temporarily transferred to the United Nations Department of Social Affairs on Sept. 1, and its responsibilities for epidemiological and public health statistics, were henceforth the responsibility of the

World Health Organization. On Dec. 7, the United Nations General Assembly in New York unanimously passed a resolution describing these arrangements as "final."

PRINCETON ACTIVITIES

A special glance should perhaps be directed retrospectively towards certain activities established in the United States in 1940 when the German armies threatened to engulf Switzerland. The Economic, Financial and Transit Department had been established at the Institute for Advanced Study in Princeton on the joint invitation of the Institute, Princeton University, and the Rockefeller Foundation. This action had contributed greatly not only to maintaining the League's valuable activities in the field but also to establishing the new technical agencies of the United Nations. The members of the group, which were officially described as having "enjoyed every facility for carrying on its research work and publications," were transferred almost *en bloc* to the United Nations; the League Assembly unanimously approved a warm resolution of appreciation to the three American institutions. Dr. Frank Aydelotte, Director of the Institute, made this further comment in his 1946 report:

"The members of the Economic Section of the League of Nations who have been in residence at the Institute since 1940 have now been appointed to the United Nations and transferred to the headquarters on Long Island. The members of this group were invited to Princeton in the dark days of 1940 when it looked as if the German armies might possibly invade Switzerland and when it seemed quite certain in any case that the war would seriously cripple their work in Geneva. Our purpose was to preserve the group intact in order that they might eventually be taken over by whatever international organization succeeded the League of Nations after the war, thus saving for the new organization the immense store of technical knowledge and experience gathered by these experts in twenty years of work for the League.

"It was by no means certain in 1940 that the Allies would win the war. No one could be sure at that time whether the League of Nations would survive or whether any similar international organization would be formed to replace it. Nor could we be certain in the third place that any such organization, if it came into being, would be prepared to take over intact the Economic Section of the League. It is a matter of great satisfaction to record that all three of our hopes have been fulfilled and that our purpose in bringing the members of the League Economic Section to Princeton has now been accomplished. The result is that the technical economic work of the United Nations can date its beginning not from 1946 but from 1920."

TRUSTEESHIP

The League activity which caused the greatest difficulty for the United States was the transfer of the mandates system into the trusteeship system. The American Delegation at the San Francisco Conference had taken a large part in the evolution of that system, but when it came to applying its provision to the Japanese mandated islands which were under naval occupation, a fundamental difference of opinion arose. Some wished to put the islands under the trusteeship system in line with what were felt to be commitments under the Atlantic Charter and elsewhere; others sought outright control or even annexation of territories which had cost many American lives and were considered vital to its future safety.

President Truman, early in January 1946, issued a statement calling for a strategic trusteeship, but the statement was not everywhere accepted as definitive, and the conflict continued. Just before the opening of the General Assembly, when it was hoped that all the trust agreements could be confirmed and the Trusteeship Council established, John Foster Dulles, American spokesman on the subject, stated that he would be embarrassed to take a position on other aspects of this question because of the lack of clarity of America's position towards its own claims. On Nov. 6, President Truman issued a fuller statement that the "United States is prepared to place under trusteeship, with the United States as the administering authority, the Japanese mandated islands" and other islands, and transmitted to the other members of the Security Council a draft agreement to that end, which, as he explained, would give the United States "administrative, legislative, and jurisdictional power" over the Marshall, Caroline, and Mariana islands as an "integral part of the United States," but within limits of provisions of the Charter of the United Nations. A trust area would be established embracing some 650 small islands with a population of 70,000, a land area of 1,049 square miles, and an ocean area of over 1,000,000 square miles.

This proposal raised further questions both domestically and within United Nations circles. The designation as a strategic area of so large a territory was unexpected; it had generally been thought such areas would be small localities. The United States did not, however, have to press the matter before the Trusteeship Committee of the General Assembly, as strategic areas were to be subject to the Security Council. Accordingly, the American Delegation played a large part in the general trusteeship debates in the Assembly and awaited the New Year to discuss its own project before the Security Council. With this exception and that of German South West Africa, the former League mandates were all taken over and the new United Nations Trusteeship system put into operation.

THE WORLD COURT

Nearly four decades embracing two world wars elapsed before the United States was able to assume its place in a world court of law first proposed to the other nations of the world by an American Secretary of State, Elihu Root, in 1907. "It should be your purpose," he instructed the American delegation, "to bring about in the Second Conference a development of the Hague Tribunal into a permanent tribunal composed of judges who are judicial officers and nothing else, who are paid adequate salaries, who have no other occupation, and who will devote their entire time to the trial and decision of international causes by judicial methods and under a sense of judicial responsibility."

Nothing effective happened, however, towards the creation of such a Court until the creation of the League of Nations provided a mechanism through which Secretary Root himself, sitting as an expert, could propose a method for selecting 12 judges from five times as many nations. For 20 years thereafter, every President and Secretary of State, whether Republican or Democratic, sought to effect American membership in the Court, but always without success owing to prejudice, mistrust, or misunderstanding in a Senate minority. When, however, a slightly amended statute was included as an integral part of the United Nations Charter, ratification became automatic, and the United States took its place as a member of the Court without any of the dire consequences predicted with such passion through two decades.

For the first time, on Feb. 6, 1946, the United States took part in the voting for the election of judges by the General Assembly and the Security Council of the United Nations meeting in London. America's interest was not merely passive; Secretary of State Byrnes was able to say in his report to President Truman that ". . . the final list of the fifteen Judges elected included twelve of the candidates for whom the United States Delegation, as instructed, had voted on the first ballot." Among them was a judge of American nationality, Green H. Hackworth, for many years Legal Adviser to the State Department. Judge Hackworth had been nominated in these new circumstances by the American group which had twice previously nominated Judge Manley O. Hudson, who had in turn twice been elected by the League Assembly and who had served on the bench for ten years.

The final step in completing America's membership in the Court came on Aug. 2 when the Senate, by the overwhelming vote of 60 to 2, accepted the so-called optional clause giving the Court compulsory jurisdiction in certain specified types of cases. This clause, also first proposed by Secretary Root in 1921, represented a step forward towards the establishment of a world law and jurisdiction, and an appreciable relaxation of uncontrolled national sovereignty. Its acceptance by the Senate almost without debate or opposition was another indication of the fundamental reversal in American foreign policy; it was fitting, in view of previous delays, that the United States should be amongst the first nations to deposit its ratification of this clause.

CONCLUSION

This last review in a series begun in 1930 could not end more appropriately than with the words chosen by Viscount Cecil of Chelwood, drafter of the Covenant and elder statesman of the League, to conclude his own last speech at the final Assembly: "The League is dead: long live the United Nations."

CHRONOLOGY OF INTERNATIONAL EVENTS, 1946

JANUARY

1—Siam terminates "state of war" with Great Britain and India.

2—War crimes trial of Nazi leaders reopens.

4—British Lieut. General Sir Frederick E. Morgan ordered to resign his position with UNRRA because of his previous announcement that Polish Jews were fleeing to American zone in Germany in order to leave Europe.

5—U. S. delegation to UN Assembly arrives in London.

8—President Truman endorses Big Three Moscow Agreement. General Morgan refuses to resign. British troops move against Indonesian rioters in Java.

9—Byrnes, American Secretary of State, announces that no atomic bomb secrets will be given away without Congressional approval.

10—UN General Assembly in London names Paul Henri Spaak, Belgian Foreign Minister, as President. Export-Import Bank lends $25,000,000 to Greece to buy supplies and equipment.

14—Secretary of State Byrnes asks General Assembly of UN to adopt Big Four's atomic resolution.

16—United States refuses to recognize acquisition of Indo-Chinese territories by Siam under Japanese occupation.

18—Council of Foreign Ministers meet in London to discuss peace treaty with Italy. Soviet Union's Gromyko appeals for support of Big Five veto power.

19—Iran asks Security Council to adjust her complaint of Russia's interference with her internal affairs.

20—Hungarian oil fields at Lispe seized by Red Army. Big Five meets in London. United Nations Security and Political Committee adopts a six-nation resolution on atomic energy.

24—General Assembly of UN passes a resolution to establish a commission to study control of atomic energy.

26—Moscow maintains that at Yalta conference, Russia had been promised Kurile Islands.

28—Discussion begins on dispute between Russia and Iran.

29—Trygve Lie of Norway named Secretary General of UN. General Morgan restored as Chief of Operations for UNRRA in Germany.

30—Great Britain announces that 1,500 Jews per month will be allowed to enter Palestine. Great Britain and Egypt agree to review their treaty status.

FEBRUARY

2—UN provisionally selects Westchester County, New York, as permanent headquarters.

6—Vishinsky withdraws charge that British troops in Greece constitute a threat to peace.

7—United States secures agreement of Russia and Great Britain to a temporary agreement of operation pending drawing up of a formal treaty with Italy.

8—Soviet Union opens its cases at Nuremberg against 21 Nazi leaders under indictment.

9—United States again bars Franco Spain from membership in the UN. Soviets ask $100,000,000 Italian reparations.

10—Vishinsky, Soviet Vice Foreign Commissar, renews his charge that British troops in Indonesia constitute a threat to world peace.

11—To provide full and free international air transportation, an Anglo-American air agreement is signed in Hamilton, Bermuda. To secure Russia's entry into the war, it is revealed that Roosevelt and Churchill in 1945, at Yalta, agreed to cede Kurile Islands to Russia; preserving *status quo* in Outer Mongolia; restoring Russian sovereignty over southern part of Sakhalin Island; restoring Russian lease on Port Arthur as a naval base; and, jointly with China, operation of Chinese and South Manchurian railroads.

12—UN votes consultative affiliation with Economic and Social Council of UN to World Federation of Trade Unions and American Federation of Labor. Along with 19 other Western Hemisphere Republics, the United States charges Argentine government with giving support to German war effort and refuge to Nazi politicos.

14—General Assembly of UN agrees on locating permanent headquarters in or about New York City.

15—UN Security Council agrees that British and French troops should be withdrawn from Syria and Lebanon.

18—Vatican raises 32 prelates to Cardinals; four from the United States.

20—Soviet Union admits securing secret data on atomic energy in Canada; brands what was secured as unimportant.

21—British Foreign Secretary Bevin offers to extend British-Russian treaty of alliance from 20 to 50 years.

23—London Conference of Jewish Organizations from 14 countries opens.

26—Moscow reports that greater part of Russian troops have been evacuated from Manchuria. French government orders closing of Spanish frontier.

27—Spanish close their side of Spanish-French border.

28—Great Britain and France sign civil aviation pact in London.

MARCH

1—Arab League backs Egypt, believing that Egypt acts within her rights.

2—Arab League demands abolition of British mandate over the Holy Land and calls for the creation of Palestine as an independent Arab state. Soviet Union announces beginning of withdrawal of its troops from Iran.

3—United States urges broadening of base of Bulgarian government —Russia admitted failure previously in this effort.

4—French Foreign Minister Bidault suggests a four-power conference on central administration for Germany. Great Britain, France, and United States join in urging people of Spain to throw Franco out by peaceful means.

5—Speaking at Westminster College, Fulton, Missouri, Winston Churchill suggests a fraternal association between the United States and the British Empire in order to stem "expansive and proselytizing tendencies" of the Soviet Union. Secretary Byrnes supports China for resisting Russian demands in Manchuria; he also protests Russia's retention of troops in Iran.

7—Soviet Union troops in Iran after March 2 deadline arouse ire of United States. Russia asks Turkey to return Kars and Ardahan regions.

8—Molotov charges United States with violating Moscow agreement by urging broadening of Bulgarian government. Zionists plead that 1,000,000 more Jews be brought to Palestine during next ten years. UN opens monetary conferences at Wilmington Island, Savannah, Ga.; two units in session—the International Monetary Fund and the International Bank for Reconstruction and Development.

11—Soviet Union offers France wheat and barley to overcome shortages. Secretary Byrnes denies Russian charge of violating Moscow agreement as regards Bulgaria. United States refuses to endorse French plan to bring Spanish affairs before UN Security Council. U. S. Secretary of Treasury, Fred M. Vinson elected Chairman of World Bank and Fund in session in Georgia.

13—Moscow press protests presence of American troops in Middle East.

15—Iranian Premier Ahmad Chavam protests continued presence of Russian troops in his country. UN Secretary, Trygve Lie, arrives in Washington, D. C. Churchill again urges Russia to capitalize on sympathy of English-speaking people for people of Russia. At opening meeting of UNRRA in Atlantic City, President Truman lauds UNRRA as the "best instrument . . . to deal with the critical situation."

16—Russian Ambassador Andrei A. Gromyko makes public plea for good relations among Great Britain, United States, and Russia. British Foreign Secretary Bevin reiterates his offer of a 50-year friendship treaty with the Soviet Union. With available grain supply 40% short of necessary requirements, UNRRA Food Boards draft a plan at Atlantic City to spread the supply to help the entire famine area.

17—Russia begins to evacuate Bornholm, Danish island at Baltic Sea entrance. Russia negotiating for Iran oil concessions. Uniate Church of the Ukraine, allied with the Roman Catholic Church since 1596, breaks that bond and rejoins the Russian Orthodox Church.

18—Vatican states that break of Uniate Church is invalid. Answering the United States White Book condemnation of Franco, the Spanish Foreign Ministry charges that the United States, in 1943, engaged in espionage activities in Spanish North Africa and had planned an invasion of the Iberian Peninsula. Speaking at Columbia University, Winston Churchill admonishes Communists to study the life of the white ant.

19—After a 22-year break, the Swiss resume diplomatic relations with Russia.

20—Ex-President Herbert Hoover arrives in Paris to begin his survey of food problems in critical areas.

21—United States announces that it will sign no treaty for maintenance of continental peace and security if Juan D. Perón, Argentina, be one of the signatories.

22—Premier Stalin lauds UN as best means of preserving peace in the world. Trans-Jordan, no longer a mandate, signs mutual assistance pact and alliance with Great Britain.

23—Iranian Premier Ghavam states no additional Russian troops have entered Iran since March 2. Chinese Foreign Minister Wang Shihchieh announces plan whereby all Russian troops will have left Manchuria by end of April. French and Lebanese agree on removal of French troops and matériel before Dec. 31, 1946.

25—American delegation at UNRRA conference in Atlantic City charges that Russian armies in Austria have seized enough land to feed hundreds of thousands; Russian member, N. I. Feonov, leaves the meeting. Iranian government denies existence of any secret agreement with the Soviet Union. UN Military Staff holds its first meeting.

26—Security Council, despite Soviet objections places Iran's charges on its agenda. An appeal made to Security Council to assure a fair trial for General Draja Mikhailovitch.

27—Failing to have discussion of Iranian affairs postponed until April 10, Gromyko stalks out of Security Council session. Yugoslavia warned to stay out of Venezia Giulia. Big Five meet for second time and begin planning an international police force. Peace treaty drafts for Bulgaria and Hungary presented, by Russian delegate, to Council of Foreign Ministers in London.

28—UNRRA, meeting in Atlantic City, adopts drastic food saving program. Iran recalled before Security Council of UN to answer specific questions on Iranian situation.

29—UN Security Council orders both Soviet Union and Iran to answer, by April 3, the charge of a secret agreement existing as to removal of Russian troops from Iran. Position of Director General of UNRRA accepted by Fiorello H. LaGuardia. Following Perón's election to Presidency of Argentina, all United States Blue Book charges are denied by Argentinian government.

30—China reports movement of Russian troops from Manchuria to Korea. Treaty of friendship signed by Turkey and Iraq.

APRIL

2—Russian troops leave Iran, crossing into Soviet Union territory. Bevin addresses British Parliament for revision of Anglo-Egyptian Treaty of 1936. India pleads for immediate food aid to prevent millions from starving. Firing squad executes General Masaharu Homma, notorious originator of the "Death March of Bataan."

3—Security Council receives replies of Iran and Soviet Union as to negotiations between them. May 6 pledged as date when all Soviet troops will have been withdrawn from Iran; no political or economic concessions involved. International Court of Justice of UN meets for first time in The Hague, Netherlands.

4—UN accepts Russia's promise of May 6 withdrawal from Iran. Despite United States condemnation of Perón, Brazil pledges continued friendly relations with Argentina. British, in view of hostile attitude of Albanian government, refuse to send a minister to that country, nor will they entertain one from Albania.

5—Iran announces complete agreement reached with Russia on all matters discussed between them.

7—Gromyko calls for removal of Iranian issue from UN Security Council agenda.

8—Final meeting of League of Nations Assembly opened by Norwegian Dr. Carl Hambro, President of the Assembly. Austria asks for a seat in the UN Assembly; Argentina walks out. In London, UN Special Committee on Refugees and Displaced Persons begins conferences. Perón's government advised that the United States will cooperate in hemisphere defense if Argentina will stamp out Nazi influences.

9—Gromyko resumes attendance upon UN Security Council sessions.

10—Nikolai V. Novikov named new Russian Ambassador to the United States; Gromyko relieved from the post in order to devote his full attention to UN.

13—Mikhailovitch, on trial in Yugoslavia, branded by Soviet newspaper as traitor war criminal, and German agent; United States criticized for not taking similar stand. LaGuardia appeals for immediate aid to avert European and Asiatic famine threat. Council of Arab League approves resolution providing common citizenship in all Arab states.

15—Civil war flares in China as Soviet troops begin to withdraw. Gromyko attacks Great Britain and United States, accusing both of using Iran as a pawn in power politics.

17—Franco government of Spain accused by Poland of creating international friction. Calls upon UN to sever diplomatic relations with Spain. Argentine government angling for restoration of good relationship with United States.

18—India renews plea for grain. UN petitioned to determine facts as to Spanish situation. Greece demands about 10% of Bulgaria's total land area. United States and Russia cooperate in attempt to establish a stable Korean government. League of Nations votes itself out of existence.

23—When Soviet Government fails to have Iranian question removed from UN agenda, Gromyko announces that Soviet Union will participate in no further Iranian discussion in the Council.

24—Contingent upon the holding of free elections, United States sets up a $40,000,000 credit for Poland.

25—Molotov, at opening session of Big Four Foreign Ministers' Conference in Paris, agrees to participation in all treaty discussions by all four countries.

26—Big Four meeting in Paris takes up Italian treaty and reparations problems. Bevin takes stand against decisions regarding Germany. Herbert Hoover stresses need for grain for India.

29—With the Soviet Union not voting, UN Security Council morally condemns Franco regime and asks for investigation of his government as a threat to international peace. Bevin asks that Libya be granted immediate independence. Byrnes brings up for discussion a four-power treaty to keep Germany disarmed for 25 years.

30—Austria's claim to South Tyrol rejected by Council of Foreign Ministers. UN begins formal investigation of Franco Spain. Great Britain seeks 50-year international regime for the Ruhr. Anglo-American Committee of Inquiry on Palestine rejects idea of a Jewish state but urges admission of 100,000 Jews into Palestine.

MAY

1—Zionist spokesmen criticize failure to back a Jewish state. Arab Higher Committee, protesting report on Palestine, calls a general protest strike for May 3.

2—International Military Tribunal for the Far East meets in Tokyo to arraign 28 major Japanese war criminals.

3—Big Four warned by Yugoslavia that no border adjustment will be accepted which would leave a Slavic minority under Italian rule. Announcement made that troops of Great Britain and France have been completely withdrawn from Syria.

7—Transylvania to be returned to Rumania per agreement reached by Council of Foreign Ministers.

10—Soviet Union agrees to placing Italy's African colonies under trusteeship of United Nations with Rome acting as administrator.

13—In his report on famine conditions, Ex-President Hoover asks for 3,500,000 tons of grain to prevent starvation.

15—Big Four agree on modified armistice for Italy whereby she gets control of all her affairs, except military.

17—Four-Power disarmament commission appointed to report on state of disarmament in four occupation zones of Germany. Franco Spain branded as a threat to world peace by UN Special Committee. United States and Canada work out a coordinating plan of handling their military forces to protect their joint interests in the North American continent.

20—Herbert Hoover asks for termination of UNRRA and urges establishment of a new international food agency.

21—Switzerland agrees to surrender $58,000,000 in looted gold shipped into her borders during war and also agrees to giving up 50% of Nazi capital in Switzerland. Iran announces Russian evacuation of Azerbaijan on May 6, as agreed upon.

23—Russian evacuation of Azerbaijan confirmed by Soviet Union.

27—Molotov charges that United States and Great Britain are trying to force his hand by insisting on a 21-nation peace conference in July; he insists on drafting of preliminary treaties before such a conference shall convene.

28—France and United States reach an agreement on settlement of war accounts; French reconstruction program is awarded $1,400,000 worth of American credits. Franco says his government is not engaged in atomic research. Seven Arab rulers meet in Cairo. Trade agreement signed by Soviet Union and Iceland.

31—United States demands that Groza government of Rumania hold free and fair elections. Great Britain does not subscribe to statement that government of Franco Spain constitutes a threat to world peace.

JUNE

1—Special committee of UN defines what persons are to receive aid under the Displaced Persons program.

3—Tokyo war criminals trial begins.

6—International Labor Office delegates, representing 32 nations, confer in Seattle, Wash. on minimum wage scale for seamen.

12—Bevin makes threat that Great Britain will sign separate peace treaties with whipped nations if Foreign Ministers fail to agree.

14—Bernard M. Baruch, speaking before United Nations Atomic Energy Commission, outlines position of United States as to atomic bomb.

17—UN Economic and Social Council adopts Russia's proposal that members of all Council commissions sit as governmental representatives.

19—Soviet plan for atom bomb control varies from that of Baruch. Russia wants to vest Security Council with the final authority, reserving power of veto to each of Big Four nations.

20—As 19-nation International Emergency Food Council is formed, the 3-nation Combined Food Board disbands. Draft constitution of International Refugee Organization adopted by UN Economic and Social Council. Foreign Ministers reach tentative agreement for eventual evacuation of troops from Italy and Bulgaria.

21—UN Economic and Social Council defeats Soviet proposal to accord World Federation of Trade Unions full participation, without vote.

24—Austrian claim for part of South Tyrol disallowed by Foreign Ministers sessions in Paris. On a seven to four vote, Security Council refuses to order UN members to sever diplomatic relations with Spain.

25—Committee established by UN Atomic Energy Commission to prepare draft of plan for world control and development of atomic energy.

27—Agreement reached by Foreign Ministers whereby Dodecanese Islands are given to Greece and Tenda and Briga area of northwest Italy to France.

JULY

1—Council of Foreign Ministers agrees to accept the ethnic line proposed by France as the western border of Yugoslavia.

2—Plans submitted by France and United States for international control of atomic energy. Paris conference deadlocked over Trieste question; Molotov objects to Byrnes' proposal that Trieste be directly responsible to UN Security Council.

3—Trieste to be established as internationalized free territory under UN Security Council.

5—Afghanistan seeks membership in UN.

8—A plan calling for establishment of an international atomic control agency is presented to the UN Atomic Energy Commission by Dr. Herbert V. Evatt, Australian Minister of External Affairs. Trans-Jordan applies for membership in UN.

10—Soviet Union makes its first clear declaration as to future of Germany; it opposes Morgenthau's plan for deindustrializing Germany; opposes federalization of Germany; and opposes French plan of detaching the Ruhr from Germany.

11—Russian Gromyko opposes Australian Evatt's control-of-atomic-energy plan. Byrnes and Bevin seek to hustle France and Russia into organizing their zones in Germany into a single economic unit.

12—Council of Foreign Ministers adjourns in Paris.

13—Siam presents border dispute with French Indo-China to UN for solution.

18—An agreement reached whereby Sweden shall account for all German assets in Sweden and turn over to the Allies $77,000,000 of such assets.

23—U. S. Ambassador to Russia, Lieut. General Walter Bedell Smith, protests in name of United States against use of Hungarian industrial production for Russian reparation payments and for maintenance of Soviet occupational forces. Arab League calls on England to install a new regime in Palestine before UN General Assembly meets in September, and, pending such action, that immigration and sale of Palestine land to Jews be regulated by British White Paper of 1939.

25—Gromyko rejects American proposal for semi-autonomous international atomic control agency.

26—Agreement reached by Great Britain, Canada, and the United States, contingent upon termination of UNRRA. Provisions of agreement were: (1) Creation of a new refugee organization to care for displaced persons; (2) the new World Health Organization to take over health activities of UNRRA; (3) the World Bank to take over rehabilitation functions of UNRRA; (4) the task of supplying food and other supplies for devastated areas to be a national matter, each nation finding aid wherever and however it could.

29—Paris Peace Conference opens for discussion of peace treaties with Italy, Rumania, Hungary, Bulgaria, and Finland. Australian Minister asks that every nation at the peace conference be on equal terms, making all recommendations by a simple majority vote.

30—Big Four Foreign Ministers present to Peace Conference the drafts of treaties for Bulgaria, Rumania, Hungary, Italy, and Finland.

31—Italy protests naval clauses in draft of treaty offered her.

AUGUST

1—Gromyko tells UN that American proposals for international inspection of atomic energy developments are contrary to the principles of state sovereignty. Russia claims that United States protest of Soviet policies in Hungary is groundless and rejects plan for American, British, and Russian joint commission for economic rehabilitation of Hungary.

2—Small nations lose fight to make Georges Bidault, President of France, the permanent Chairman of Peace Conference. British invitation to attend London Conference on Palestine accepted by Saudi Arabia, Trans-Jordan, Syria, and Lebanon.

3—Spaak of Belgium requests Peace Conference delegations to agree to acceptance of a two-thirds majority vote on all recommendations.

5—Jews vote to reject as unacceptable the British proposals as announced by Herbert Morrison. Yugoslavia and Netherlands sign a trade pact.

6—John Foster Dulles charges that behavior of Allied troops in Germany and the continued use of German prisoners of war for "slave labor" betrays Anglo-American promises made to the Germans. Entire captured reserve of the Hungarian National Bank, $32,000,000 in gold, returns to Budapest under Russian and American guard.

7—LaGuardia suggests dissolution of UNRRA by Oct. 1. Rules Committee of UN adopts British proposal for use of both two-thirds and simple majority voting in Peace Conference at Paris.

8—Yugoslavia demands reparations from Italy in the amount of $1,300,000,000. Molotov protests majority voting rule for Paris conference.

9—Uruguay and Russia sign a formal commercial treaty. Yugoslav fighter planes force U. S. plane down near Ljubljana.

10—UN proposal for an economic merger in part of German occupation zones rejected by France. Draft of Italian peace treaty denounced by Premier Gasperi.

12—In Paris conference, Albania, Mexico, Cuba, and Egypt are invited to express their opinions on Italian peace treaty.

13—Haifa Jews rebel against deportation by British of illegal immigrants.

15—Canada frees the last of its wartime conscientious objectors.

16—During a Moslem work stoppage (hartal) mass fratricide breaks out in India and streets of Calcutta are littered with corpses.

19—Yugoslavia aviators shoot down unarmed American transport plane; five fliers lose their lives.

20—UN moves into its new home at Lake Success, L. I. Italian amendments to draft peace treaty preamble rejected by 20-nation Italian commission.

21—Yugoslav Minister to Greece recalled in protest to "insults" in Greek press against Marshal Tito.

24—This date set as deadline for UN members to pay their dues. Turkey rejects Russian proposal for a joint Russo-Turkish defense of the Dardanelles.

26—France withdraws her offer of arbitration by the Hague Tribunal of her dispute with Siam over Cambodian boundary.

28—Paris peace conference defeats Australian reparations plan for Rumanian and Italian treaties.

29—Security Council admits Afghanistan, Iceland, and Sweden into UN membership; applications of Albania, Ireland, Outer Mongolia, Portugal, and Trans-Jordan are rejected.

30—Soviet Union voted $100,000,000 reparations by Italian Economic Commission in Paris.

31—Nuremberg trial of 21 Nazi war criminals ends. Palestine Arab Higher Committee rejects Great Britain's invitation to attend conference on Palestine.

SEPTEMBER

1—Street rioting in Bombay results in 60 deaths. Marshal Tito formally apologizes for death of five American fliers forced down in Yugoslavia.

2—Great Britain claims $11,520,000,000 reparations against Italy. UN Food and Agriculture Organization opens in Copenhagen.

8—Nine-year-old King Simeon of Bulgaria loses his crown as his countrymen vote to change to a Republic.

12—Henry Wallace, Secretary of Commerce, speaking at New York political rally, criticized for announcing views contrary to Secretary of State Byrnes' foreign policies.

20—Secretary Wallace dismissed from President Truman's Cabinet.

21—France's Constituent Assembly approves draft for a new constitution.

25—Feonoff, Russian representative, rejects report, made to UN, which calls for central commission to coordinate trade and industry among European nations.

27—King George II arrives at Elusis from London on his way to reassume Greek throne.

28—Australia holds triennial parliamentary elections in which the Labor party won.

30—Judges begin reading of judgments arrived at in trial of Nazi war criminals.

OCTOBER

1—Court imposes sentence on Nazi war criminals: Goering, Ribbentrop, Keitel, Kaltenbrunner, Rosenberg, Frank, Frick, Streicher, Sauckel, Jodl, Seyss-Inquart, death by hanging. Hess, Funk, Raeder, life imprisonment. Doenitz, 10 years imprisonment. Neurath, 15 years imprisonment. Schirach and Speer, 20 years imprisonment. Schacht, Papen, Fritzsche, acquitted. United States restores five-cent airmail rate, last used in 1932.

3—Secretary Byrnes, speaking to American Club in Paris, tries to allay French fears that the United States is on the verge of retreating into a policy of isolation. Canada settles its steel strike which had run since July 15.

5—Iceland's Parliament ratified treaty with United States allowing American military planes continued use of Meeks Field.

7—Vatican reports "minor excommunication" of Marshal Tito. Acting as a friend of both parties, Lord Killearn reopens negotiations in Batavia between the Indonesians and the Dutch. Japanese Diet, under leadership of Takeshi Yamazaki, adopts new national constitution.

11—Archbishop Aloysius Stepinac, after a twelve-day trial, is convicted of collaboration with the Germans and Croatian quislings; sentenced to 16 years at hard labor.

15—Paris conference ends. Hermann Goering, condemned Nazi, commits suicide in his cell in Nuremberg jail.

16—Remaining Nazi war criminals die on the gallows at Nuremberg.

20—American credits ranging from $25,000,000 to $50,000,000 extended to Turkey.

21—John L. Lewis, head of United Mine Workers in United States charges government with breach of contract and threatens soft coal strike.

22—Argentine Congress begins debate on President Perón's five-year plan for strengthening Argentina's governmental, social and industrial structure.

23—Addressing opening session UN General Assembly in New York, President Truman asks for speedy agreement on peace treaties by Big Four and also asks that UN act to remove war fears by breaking deadlock over plans for control of atomic energy. Col. Gen. Kurt Daluege, butcher of Lidice, hanged in Prague.

24—Led by Mexico, a group of little nations berate the big powers of their unsparing use of the veto in UN General Assembly. Winston Churchill charges that Russia has 200 divisions, more than 2,000,000 men on war footing in Soviet-occupied Europe. Trygve Lie condemns Franco regime in Spain and asks for restoration of democratic government in that country.

26—Chinese government troops capture Antung, strategic Manchurian port, opposite Russian-held

Northern Korea. Norway asks UN General Assembly to help Spanish people overthrow Franco's regime without bloodshed.

28—Prime Minister Attlee denies that Foreign Secretary Bevin had pledged Britain to acknowledge Egyptian sovereignty over the Sudan. Reds carry majority of votes for seats in Bulgarian Assembly.

30—United States outbids Russia in search for peace by recommending worldwide disarmament, backed by inspection system to ferret out hidden weapons.

31—Agreement reached among 18 nations to accept United States proposals for expansion of world trade and employment; full international conference ready to consider (1) international agreement on full employment policies; (2) trade barriers and discriminations; (3) restrictive business practices; (4) inter-government commodity arrangements; and (5) establishment as an agency of UN of an international trade organization. UN places three big issues on agenda for discussion in November: global disarmament, disposition of Franco Spain, and the veto power of the Big Five. House of Commons in England votes limited merger of army and navy.

NOVEMBER

1—United States balks at paying half of UN administrative costs in 1947. Belgium, Luxembourg and The Netherlands denounce Big Four domination of peace treaties.

2—Chinese government armies try to trap communist troops by gigantic battle offensive along 150 miles of Shantung's coast. Russia attempts to force UN into immediate discussion of world disarmament. UN Political Committee presented with two plans for concerted action against Spain. Holy Land virtually paralyzed by Arab strike on Balfour's declaration favoring a national home in Palestine for Jews.

3—President Truman takes firm stand to the effect that the United States will retain control of all Pacific bases needed for national security.

4—Council of Foreign Ministers of UN decides to hear representatives of Yugoslavia and Italy in bitter Trieste dispute.

5—In the United States, Republican party sweeps into control of both houses of Congress.

7—United States presents its own plan for UN trusteeship system and calls for decision on it by two-thirds of UN Assembly, denying other countries the right to try to shelve it by veto—as presented, Soviet delegates refused to comment on the plan.

8—Chiang Kai-shek orders government troops to cease firing; part of effort to arrive at revision of Chinese constitution. British troops in Palestine working under blackout conditions set up new guards for rail lines; Irgunists threaten further fighting and economic loss to British interests. United States withdraws its informal political mission from Albania—blow to hopes of that country to secure recognition. General MacArthur orders purge of over 250,000 Japanese rural officials who constituted the backbone of Japan's wartime jingoism.

9—President Truman erases wartime wage controls and nearly all remaining price controls in United States. United States plans $20,000,000 laboratory at Schenectady, N. Y., to study generation of power from atomic energy. UN admits Sweden, Iceland, and Afghanistan to membership.

10—UN rejects Trans-Jordan, Eire, Portugal, Albania, and Mongolia for membership.

12—President Truman approves former Attorney General Biddle's recommendation for establishment by the UN of a code of international criminal law. Announcement made that Rear Admiral Byrd will head a United States Navy task force in a combined training and scientific expedition to the Antarctic.

13—Lt. Gen. Lucius Clay, Deputy Commander of American occupation forces in Germany, reporting to President Truman, states that thus far America's outlay of $200,000,000 a year for occupation of Germany had only produced a trickle of products shipped to United States—$2,250,000 worth of hops. Not much hope of cutting expenses by putting Germany back on her feet again while Russia and France refuse to agree on plans for running Germany as an economic unit. British navy minesweepers sweep Corfu channel—Albania protests to UN.

17—Tentative agreement reached to settle United States west coast maritime strike, in effect since Oct. 1. Fear of general civil war sends commodity and currency prices to untold heights in Nanking and Shanghai; coal sold at $97 a ton, U. S. currency. Facing miners' strike, United States rations coal supply.

19—United States government issues writ to restrain John L. Lewis, Union boss, from precipitating soft coal strike. Communists lead in Rumanian voting. Moscow announces refusal to allow American and other foreign correspondents to make radio broadcasts from that city. UN General Assembly recommends that five little nations, previously denied admission, be received into membership, *viz.*, Albania, Outer Mongolia, Eire, Trans-Jordan, and Portugal.

20—John L. Lewis defies United States government injunction and soft coal strike begins at midnight.

21—China supports Russia in demand that reports be made to UN of disposition of all troops outside home borders and also backs demand of United States that such reports cover domestic forces as well. Britain's Bevin demands that UN begin immediate discussion of world disarmament problem.

22—Gems to the value of $25,000,000 unearthed by General MacArthur's agent in Japan. John L. Lewis, U. S. mine workers' Chieftain, served with writ charging contempt of court as 21 states adopt brownout regulations to conserve soft coal stocks.

23—United States initiates plan whereby noted German scientists are afforded chance, voluntarily, to come to America and eventually become American citizens. Molotov rejects all efforts to restrict use of veto in UN affairs. Greeks carry their border dispute problems to UN for settlement.

24—German voters in the United States occupation zone show the Communist Party a poor last in election returns. John L. Lewis, U. S. Mine Chief, appears in court to answer contempt writ; slated for later trial on the charge.

25—Russian scientists report new kind of disintegration of the atom nucleus. Poland notified that her failure to hold general elections has ruined her chances of further financial aid from the United States.

27—Egyptian students stage huge demonstration against their Premier and British Foreign Secretary Bevin.

28—Last of British troops to leave Java board their troopship at Batavia. Molotov accepts the principle of free navigation of the Danube River.

29—Greek rebel fighting breaks out on Turkish border. Russia agrees that Yugoslavia and Greece shall share equally in reparations from Italy and Bulgaria.

30—Perón announces five-year plan for development of Argentina. British military tribunal sentences General von Mackensen and General Maeltzer to death for civil massacre of 335 Italians in Rome's Ardeantine caves.

DECEMBER

1—King Michael of Rumania in opening Parliament pledges tie with Soviets. Miguel Aleman inaugurated as first civilian President of Mexico.

2—Byrd's Antarctic Expedition sails. United States invites Spain to unseat Franco. Britain and United States sign a provisional agreement for the economic fusion of British and American occupied zones of Germany.

3—John L. Lewis, United States Mine Union Labor Chief, found guilty of contempt of court in soft coal strike which threatens to cripple the United States. Socialist Vincent Auriol named President of new French National Assembly.

4—Court fines U. S. Mine Chief Lewis $10,000 and his Union $3,500,000 for guilty verdict in contempt of court case. Molotov agrees to United States arms reduction proposals as a basis for discussion and declares that the big-power veto would not apply to any system of controls and inspections in connection with arms limitation.

6—Greek Premier Constantin Tsaldaris arrives in the United States to confer with Secretary Byrnes about Albania, Bulgaria, and Yugoslavia supposedly inciting guerrilla warfare against Greek government. European satellite peace treaties virtually completed by UN. Some of the points agreed to were (1) Italy to pay $360,000,000 in reparations; (2) Italy to pay 66 2/3% of value of Allied property destroyed in Italy; (3) free use of the Danube River guaranteed; (4) denial of treaty benefits to any country which should refuse to sign a treaty; (5) fair prices to be agreed to by arbitration procedure for industrial equipment seized by Rumanian government for reparations to Russia; (6) motor torpedo boats to be permitted or denied uniformly in all treaties.

7—Martial law ordered by Iran in most of the principal towns in Mazandaran Province. Mine Chief Lewis orders United States soft coal miners to return to work. Secretary Byrnes proposes to Big Four Foreign Ministers Council to make slashing reductions in American, British, Russian, and French forces occupying Germany, Austria, Poland, and the Balkans.

8—The 54-nation full committee of UN calls upon Security Council to curb use of veto power.

9—UN Political Committee by 27 to 7 vote approves Belgian proposal for a partial, immediate diplomatic break with Spain. Council of Foreign Ministers agrees to meet in Moscow, March 10, 1947, to discuss treaties with Germany and Austria.

10—Azerbaijan Province in armed revolt against Iran government. Chinese Communists battle close to Paoting, capital of Hopeh Province. Attempt being made by 48-nation group to keep initial spirit of UNRRA alive. Great Britain creates furore in UN General Assembly with proposal for a complete accounting of all armies and armaments to be verified by a system of international inspection.

12—UN General Assembly votes to ask all UN members to recall immediately their ambassadors from Franco Spain. Socialist Leon Blum is elected head of French Government. Iranian Army moves on Tabriz, capital of Azerbaijan.

13—Russia yields to American demand that UNRRA be allowed to shift remaining relief shipments where needed. Paraguay quells uprising of anarchist elements which threatened to seize the government.

14—UN General Assembly votes to make its permanent capital in Manhattan's East Side; John D.

Rockefeller thanked for donating $8,500,000 towards purchase of necessary land and property.

16—UN assembly adjourns.

17—Russia asks UN General Assembly for more time to study whole question of atomic energy control. President-Premier Leon Blum forms all-Socialist Cabinet to run affairs of France. Turkish Army padlocks eight Communistic publications in Istanbul.

19—Churchill accuses British Labor Party of tyranny, conceit, and incompetence. United States, by offering huge credit to China, seeks to bring end to Chinese civil war. Two Swedish scientists, engaged in atomic research, produce the Aurora Borealis accidentally.

20—Russia rejects Canadian compromise calling for action on principles of American atomic control plan. Russia summarily orders United States submarine out of Darien.

21—Giant tidal wave, set in motion by earthquake, strikes southern Japan causing heavy property damage and loss of life.

22—Great Britain recalls her ambassador to Spain. Yugoslav court sentences 18 Nazi war criminals to death for Serbian murders. Great Britain and Russia sign an agreement opening way for unlimited trade between the two occupation zones in Germany.

24—Pope Pius XII declares that world stands in grave danger of new conflicts. Gen. Joseph McNarney grants amnesty to 800,000 "little Nazis" in American zone of occupation. France's Fourth Republic came into being. The provincial state of East Indonesia is formally proclaimed and becomes Asia's newest government.

26—Americans demand that French explain reports that they are stripping industries from French zone of occupation in Germany and transferring them to the Saar Basin.

27—U. S. Representative Bernard Baruch warns the UN that the United States will not give up the secret of the atom bomb unless a treaty for outlawing atomic weapons provides virtually automatic punishment of countries which break it.

28—General Charles de Gaulle refuses to be a candidate for President of France's Fourth Republic.

29—Members of Irgun Zvai Leumi, Jewish underground organization, kidnap a British major and three noncommissioned officers, strip them, and give them each 18 lashes as revenge for punishment meted out to one of their number while in a Jerusalem prison. Andrei Gromyko promoted to post of a Deputy Foreign Minister of Russia.

30—After more than six months of debate, the UN Atomic Energy Commission approves the United States Atomic Control Plan. Russia may use veto when it comes up before the Security Council.

31—President announces end of hostilities in Second World War as of noon.

PART TWO

AMERICAN GOVERNMENT

DIVISION III

THE NATIONAL GOVERNMENT

FEDERAL ADMINISTRATIVE ORGANIZATION

By William M. Schuyler
Editor, *The American Year Book*

THE PRESIDENT AND VICE PRESIDENT

President.—Harry S. Truman of Missouri (Democrat). Sworn into office as President of the United States, April 12, 1945, in succession to Franklin Delano Roosevelt, deceased on that date.

Vice President.—Vacant.

Executive Office of the President.—

White House Office—Matthew J. Connelly (Massachusetts), Charles G. Ross (Missouri), and William D. Hasset (Vermont), Secretaries.
Special Assistants to the President—John R. Steelman and Edwin A. Locke, Jr.
Special Counsel to the President—Clark M. Clifford.
Military Aide to the President—Major Gen. Harry H. Vaughan.
Naval Aide to the President—Rear Admiral James H. Foskett.
Executive Clerk in Charge of the White House Executive Offices—Maurice C. Latta.
Bureau of the Budget—James E. Webb, Director.
Council of Economic Advisers—Edwin G. Nourse, Chairman.
Liaison Office for Personnel Management—Raymond R. Zimmerman, Liaison Officer.
Council of National Defense—Secretaries of War, Navy, Interior, Agriculture, Commerce, and Labor.
Civilian Production Administration—J. D. Small, Administrator.
Office of Defense Transportation—J. M. Johnson, Director.
Office of Scientific Research and Development—Dr. Vannevar Bush.
Philippine Alien Property Administration—Vacant.
War Assets Administration—Robert M. Littlejohn, Administrator.

Presidential Vacancy.—By Act of Congress, in the case of vacancy occurring in the office of President through the death or removal of both the President and Vice President, the Cabinet Officers succeed to the Presidency in the order indicated in the arrangement of the following summary of the executive departments:

DEPARTMENT OF STATE

Secretary of State.—George C. Marshall.

Under Secretary of State.—Dean Acheson.

Under Secretary of State for Economic Affairs.—William L. Clayton.

Assistant Secretary of State for European, Far Eastern, Near Eastern, and African Affairs.—Vacant.

Assistant Secretary of State for Administration.—Donald S. Russell.

Assistant Secretary of State for American Republic Affairs.—Spruille Braden.

Assistant Secretary of State for Public Affairs.—William Benton.

Assistant Secretary of State for Occupied Areas.—John H. Hilldring.

Assistant Secretary of State for Economic Affairs. — Willard L. Thorp.

Legal Adviser.—Charles Fahy.

Special Assistants to the Secretary of State.—

Press Relations, Michael J. McDermott; Research and Intelligence, William A. Eddy; Special Assistants to the Secretary, Joseph W. Ballantine and R. Borden Reams.

Director General of the Foreign Service.—Selden Chapin.

Assistants to the Secretary of State.—Charles E. Bohlen, Blanche R. Halla, Carlton Savage, and Cassie Connor.

Offices and Their Directors.—European Affairs, H. Freeman Matthews; Far Eastern Affairs, John Carter Vincent; Near Eastern and African Affairs, Loy W. Henderson; American Republic Affairs, Ellis O. Briggs; Special Political Affairs, Alger Hiss; International Trade Policy, Clair Wilcox; Financial and Development Policy, Norman T. Ness; Economic Security Policy, Hamilton Robinson; Transport and Communications, Garrison Norton; Public Affairs, Francis H. Russell; International Information and Cultural Affairs, William T. Stone; Foreign Service, Julian F. Harrington; Departmental Administration, Carlisle H. Humelsine; Budget and Finance, J. Carney Howell (acting); Controls, Frederick B. Lyon; Intelligence Coordination and Liaison, Allan Evans (acting); Intelligence Collection and Dissemination, George R. Fearing, Jr.

DEPARTMENT OF THE TREASURY

Secretary of the Treasury.—John W. Snyder.

Charged with the management of the national finances; prepares plans for the improvement of the revenue and support of the public credit; superintends collection of the moneys paid from and into the Treasury; controls construction of public buildings, coinage and printing of money, *ex officio* chairman of the Federal Reserve Board.

Under Secretary of the Treasury.—Vacant.

Assistant Secretary of the Treasury.—Edward H. Foley, Jr.

Fiscal Assistant Secretary of the Treasury.—Edward F. Bartelt.

Special Assistant to the Secretary.—Andrew N. Overby.

Assistants to the Secretary.—Vernon L. Clark and Arthur Gardner.

Budget Officer.—Willard L. Johnson.

General Counsel.—Joseph J. O'Connell, Jr.

U. S. Secret Service.—James J. Maloney, Acting Chief.

Director of Public Relations.—Charles P. Shaeffer.

Administrative Assistant to the Secretary.—William W. Parsons.

Chief Clerk.—F. A. Birgfeld.

Commissioner of the Public Debt Service.—Edwin L. Kilby.

Commissioner of Accounts.—Robert W. Maxwell.

Director of Foreign Funds Control.—Orvis A. Schmidt.

Director of Monetary Research.—Harold Glasser.

Director of Research and Statistics.—George C. Haas.

Director of Tax Research.—Louis Shere (acting).

Comptroller of the Currency.—Preston Delano.

Has supervision of the national banks, their examination and reports; preparation and issue of national bank circulation; redemption and destruction of national bank notes. *Ex officio* member of the Federal Reserve Board.

Treasurer of the United States.—William A. Julian.

Charged with the receipts and disbursement of all public moneys deposited in the Treasury and Sub-

Treasuries and in national banks depositories.

Commissioner of the Bureau of Customs.—W. R. Johnson.

Commissioner of the Bureau of Internal Revenue.—Joseph D. Nunan, Jr.

Charged with general supervision of the collection of all internal revenue taxes, including the income tax, and the enforcement of internal revenue laws.

Director of the Bureau of the Mint.—Nellie Tayloe Ross.

Has general supervision of the mints and assay offices.

Commissioner of Narcotics.—H. J. Anslinger.

Director of the Bureau of Engraving and Printing.—Alvin W. Hall.

Produces all the securities and similar work of the Government printed from steel plates.

Director of Procurement.—Clifton E. Mack.

United States Coast Guard.—Admiral Joseph F. Farley, Commandant.

Committee on Practice.—John L. Graves, Chairman.

U. S. Savings Bonds Division.—Vernon L. Clark, National Director.

DEPARTMENT OF WAR

Secretary of War.—Robert P. Patterson.

Under Secretary of War.—Kenneth C. Royall.

Assistant Secretary of War.—Howard C. Petersen.

Assistant Secretary of War for Air.—W. S. Symington.

Administrative Assistant and Chief Clerk.—John W. Martyn.

Special Assistants to the Secretary of War.—Col. Tracy S. Voorhees, John H. Ohly, and Dean Rusk.

Executive Assistant to the Secretary of War.—Col. A. Robert Ginsburgh.

Office of Chief of Staff.—General of the Army Dwight D. Eisenhower, Chief of Staff; Gen. Thomas T. Handy, Deputy Chief of Staff.

Commanding General, Army Ground Forces.—Gen. Jacob L. Devers.

The Adjutant General.—Major General Edward F. Witsell.

The Inspector General.—Lieut. Gen. Daniel I. Sultan.

The Judge Advocate General.—Major Gen. Thomas H. Green.

The Quartermaster General.—Major Gen. Thomas B. Larkin.

Chief of Finance.—Major General William H. Kasten.

Surgeon General.—Major Gen. N. T. Kirk.

Chief of Engineers.—Lieut. Gen. R. A. Wheeler.

Chief of Ordnance.—Major General Everett S. Hughes.

Chief Signal Officer.—Major General H. C. Ingles.

Commanding General, Army Air Forces.—General Carl A. Spaatz.

Chief of the National Guard Bureau.—Major General Butler B. Miltonberger, Acting.

Chief of the Chemical Warfare Service.—Major Gen. Alden H. Waitt.

Chief of Transportation.—Major Gen. Edmund H. Leavey.

Provost Marshal General.—Brig. Gen. Blackshear M. Bryan.

War Department Special Staff.—Major General Willard S. Paul, Director of Personnel and Administration.

DEPARTMENT OF JUSTICE

Attorney General.—Tom C. Clark.

Represents the United States in all legal matters.

Solicitor General.—Vacant.

Assistant to the Attorney General.—Douglas W. McGregor.

Special Assistant to the Attorney General.—A. Devitt Vanech.

Assistant Attorneys General.—John F. Sonnett, Wendell Berge, Theron Lamar Caudle, David L. Bazelon, and Paul P. Rao.

Immigration and Naturalization Service.—Ugo Carusi, Commissioner.

Director of the Federal Bureau of Investigation.—J. Edgar Hoover.

Director of the Bureau of Prisons.—James V. Bennett.

Administrative Assistant to the Attorney General.—Salvator A. Andretta.

Director of Public Relations.—Timothy A. McInerny.

Chief of the Division of Accounts.—Eugene J. Matchett.

Chief Clerk.—Harvey C. Donaldson.

Librarian.—Matthew A. McKavitt.

Pardon Attorney.—Daniel M. Lyons.

Board of Parole.—T. Webber Wilson, Edward P. Reidy, and Douglas P. Lucas.

Board of Immigration Appeals.—Thomas G. Finucane, Chairman.

POST OFFICE DEPARTMENT

Postmaster General.—Robert E Hannegan.

Executive Assistant to the Postmaster General.—Frank Pace, Jr.

Special Assistant to the Postmaster General.—Samuel R. Young.

First Assistant Postmaster General.—Jesse M. Donaldson.

Second Assistant Postmaster General.—Gael E. Sullivan.

Third Assistant Postmaster General.—Joseph J. Lawler.

Fourth Assistant Postmaster General.—Walter Myers.

Director of Parcel Post.—Jesse C Harraman.

Director of Budget and Administrative Planning.—Joseph F. Gartland.

Chief Clerk and Director of Personnel.—Edgar B. Jackson.

Solicitor.—Frank J. Delany.

Chief Post Office Inspector.—James J. Doran.

Comptroller.—John J. Haggerty

DEPARTMENT OF THE NAVY

Secretary of the Navy.—James Forrestal.

Under Secretary of the Navy.—John L. Sullivan.

Assistant Secretary of the Navy.—W. John Kenney.

Assistant Secretary of the Navy for Air.—John Nicholas Brown.

FEDERAL JUDICIAL ORGANIZATION

By WILLIAM M. SCHUYLER
EDITOR, *The American Year Book*

SUPREME COURT OF THE UNITED STATES

Frederick M. Vinson (Kentucky), Chief Justice of the United States, appointed 1946.

Hugo L. Black (Alabama), appointed 1937.

Stanley F. Reed (Kentucky), appointed 1938.

Felix Frankfurter (Massachusetts), appointed 1939.

William Orville Douglas (Minnesota), appointed 1939.

Frank Murphy (Michigan), appointed 1940.

Robert H. Jackson (New York), appointed 1941.

Wiley Blount Rutledge, Jr. (Kentucky), appointed 1943.

Harold H. Burton (Ohio), appointed 1945.

Officers of the Supreme Court: Clerk—Charles Elmore Cropley.

Deputy Clerks—Reginald C. Dilli, Hugh W. Barr, Harold B. Willey.

Marshal—Thomas E. Waggaman.

Reporter—Walter Wyatt.

Librarian—Oscar D. Clarke.

UNITED STATES CIRCUIT COURT OF APPEALS

District of Columbia Judicial Circuit.—Mr. Chief Justice Vinson.

First Circuit.—Mr. Justice Frankfurter; Calvert Magruder (Massachusetts), John C. Mahoney (Rhode Island), Peter Woodbury (New Hampshire).

Second Circuit.—Mr. Justice Jackson; Learned Hand (New York), Thomas W. Swan (Connecticut), Augustus N. Hand (New York), Harrie Brigham Chase (Vermont), Charles E. Clark (Connecticut), Jerome N. Frank (New York).

Third Circuit.—Mr. Justice Burton; Albert Branson Maris (Pennsylvania), John Biggs, Jr. (Delaware), John J. O'Connell (Pennsylvania), Herbert F. Goodrich (Pennsylvania), Gerald McLaughlin (New Jersey), Harry E. Kalodner (Pennsylvania).

Fourth Circuit.—Mr. Chief Justice Vinson; John J. Parker (North Carolina), Morris A. Soper (Maryland), Armistead M. Dobie (Virginia).

Fifth Circuit.—Mr. Justice Black; Samuel H. Sibley (Georgia), Joseph C. Hutcheson, Jr. (Texas), Edwin R. Holmes (Louisiana), Leon McCord (Alabama), Curtis L. Waller (Florida), Elmo Pearce Lee (Louisiana).

Sixth Circuit.—Mr. Justice Reed; Xenophon Hicks (Tennessee), Charles C. Simons (Michigan), Florence E. Allen (Ohio), John D. Martin (Tennessee), Thomas F. McAllister (Michigan), Shackelford Miller, Jr.

Seventh Circuit.—Mr. Justice Murphy; Evan A. Evans (Wisconsin), William M. Sparks (Indiana), J. Earl Major (Illinois), Sherman Minton (Indiana), Otto Kerner (Illinois).

Eighth Circuit.—Mr. Justice Rutledge; Kimbrough Stone (Missouri), John B. Sanborn (Minnesota), Archibald K. Gardner (South Dakota), Joseph W. Woodrough (Nebraska), Seth Thomas (Iowa), Harvey M. Johnsen (Missouri), Walter G. Riddick (Arkansas).

Ninth Circuit.—Mr. Justice Douglas; Francis A. Garrecht (Washington), William Denman (California), Clifton Mathews (California), Albert Lee Stephens (California), William Healey (Idaho), Homer T. Bone (Washington), William E. Orr (California).

Tenth Circuit.—Mr. Justice Rutledge; Orie L. Phillips (Colorado), Sam G. Bratton (New Mexico), Walter A. Huxman (Kansas), Alfred P. Murrah (Oklahoma).

UNITED STATES COURT OF CUSTOMS AND PATENT APPEALS

Finis James Garrett (Tennessee), Presiding Judge, appointed 1929.

Oscar E. Bland (Indiana), appointed 1923.

Charles Sherrod Hatfield (Ohio), appointed 1923.

Joseph R. Jackson (Montana), appointed 1937.

Ambrose O'Connell (Iowa), appointed 1944.

UNITED STATES COURT OF APPEALS FOR THE DISTRICT OF COLUMBIA

D. Lawrence Groner, Chief Justice.
Harold M. Stephens.
Henry White Edgerton.
Bennett Champ Clark.
Wilbur K. Miller.
Elijah B. Prettyman.

UNITED STATES EMERGENCY COURT OF APPEALS

Albert Branson Maris, Chief Judge.
Calvert Magruder.
Walter C. Lindley.
Bolitha J. Laws.
Thomas F. McAllister.

COURT OF CLAIMS OF THE UNITED STATES

Richard S. Whaley (South Carolina), Chief Justice, appointed 1939.

Benjamin H. Littleton (Tennessee), ppointed 1929.

Samuel E. Whitaker (Tennessee), ppointed 1939.

Marvin Jones (Texas), appointed 940.

Joseph W. Madden (Illinois), appointed 1941.

DISTRICT COURT OF THE UNITED STATES FOR THE DISTRICT OF COLUMBIA

Bolitha J. Laws, Chief Justice.
James M. Proctor.
F. Dickinson Letts.
Daniel W. O'Donoghue.
Jennings Bailey.
T. Alan Goldsborough.

United States Marshal.—W. Bruce Matthews.

UNITED STATES ATTORNEY'S OFFICE

United States Attorney, District of Columbia.—Edward M. Curran.

Assistants.—Charles B. Murray, George E. McNeil, Cecil R. Heflin, Grace B. Stiles, John B. Diamond, Arthur J. McLaughlin, William Hitz, Stephen C. Miller, Sidney S. Sachs, John C. Conliff, Jr., John P. Burke, Sylvan Schwartz, Joseph F. Lawless, Helena D. Reed, John J. O'Leary, Daniel B. Maher, Andrew J. Howard, John D. Lane, William S. McKinley, Evan T. Davis, Brewster H. Marshall, Edward Molenof, John Lewis Smith.

CIVIL SERVICE IN THE UNITED STATES

By Harry B. Mitchell

President of the United States Civil Service Commission

RESUMPTION OF CIVIL SERVICE PROCEDURES

The national defense period for a year or two before the beginning of the war on Dec. 7, 1941 brought many thousand employees into the Federal service, a large proportion on a temporary basis. It became apparent that the resources of the entire nation in manpower and in agriculture and industry would be enlisted for the war's duration. This meant great expansion in the civilian activities of the Federal Government.

In order that the permanent positions after the war would be available for competition among the returning veterans and the war workers, the President in February 1942 directed the Civil Service Commission to promulgate regulations under which all civilian appointments would be limited to the duration of the war and six months thereafter. These regulations became effective March 16, 1942, for the service generally, with the exception of the field services of the postal establishment. They were extended to the postal field services on Oct. 23, 1943. More than 7,000,000 war service appointments were made during the war period through the placement activities of the Civil Service Commission.

Three things combined to warrant resumption of regular civil service procedures early in 1946: (1) end of hostilities; (2) rapid demobilization of the Army and Navy; and (3) great reduction in the number of civilian employees as pointed out under the heading Employment in the Executive Civil Service.

The President on Feb. 4, 1946 signed an Executive order directing the Civil Service Commission to resume regular civil service procedures as promptly as its resources would permit. Temporary Civil Service Regulations were issued, which were similar to the Civil Service Rules existing before the war, and were effective March 7, 1946.

The first examination held was that for stenographer and typist positions for which 266,548 applications were filed throughout the country. The number of eligibles secured was less than required, and the examination was reopened in October 1946 indefinitely. Other examinations announced cover the fields of chemistry, physics, patent examiner, engineering, budget and finance, forestry, library science, geology, drafting, dietetics, auditing and accounting, and the postal services.

BAN ON STRIKES BY FEDERAL EMPLOYEES

Congress enacted legislation which banned strikes by Federal employees. The employees are required to sign an affidavit that they are not members of an organization of government employees which asserts the right to strike against the Federal Government. Any employee who subsequently violates his affidavit is held to be guilty of a felony.

GOVERNMENT REORGANIZATION

There was approved on Dec. 20, 1945 the Reorganization Act of 1945. This gave the President authority for a two-year period to issue executive orders for reorganizing the executive branch of the Government. Three such plans have been presented to Congress, two of which became law.

Reorganization Plan No. 1 was disapproved. It provided among other things for the establishment of a permanent National Housing Agency, to which Congress took exception.

Plan No. 2 brought under the Federal Security Agency certain functions of the Children's Bureau of the Department of Labor, and functions of the Secretary of Commerce, Bureau of the Census, and Director of the Census with respect to vital statistics. The Social Security Board was abolished and its functions placed in the Federal Security Administrator. The United States Employees' Compensation Commission was abolished and its functions transferred to the Federal Security Agency.

Plan No. 3 provided for certain consolidations in the Treasury, Navy, Interior, Agricultural, and Commerce Departments, as well as other changes involving the National Labor Relations Board, Smithsonian Institution, and United States Employment Service.

PAY LEGISLATION

As in 1945, Congress passed two general pay bills, one for the postal services and the other for the services not subject to adjustment of pay by wage boards.

The postal pay bill (Public Law 386, 79th Congress, approved May 21, 1946), with a few exceptions, provided an increase of $400 per annum to postmasters, officers, and employees of the postal services; employees paid on an hourly or part-time basis receive additional compensation at the rate of 20¢ per hour; and fourth-class postmasters receive additional compensation at the rate of 20 per cent of their basic annual pay. The bill was made retroactive to Jan. 1, 1946.

The Federal Employees Pay Act of 1946 (Public Law 390, 79th Congress, approved May 24, 1946) provided pay increases to the groups of employees referred to specifically, including employees in the legislative, executive, and judicial branches. The general increase was 14 per cent or $250 per annum, whichever is the greater, except that no pay is to be increased by more than 25 per cent. The maximum annual salary was set at $10,000. The act was made effective July 1, 1946.

EMPLOYMENT IN THE EXECUTIVE CIVIL SERVICE

There has been steady reduction in the number of civilian employees in the Federal service in continental United States since the high point of 3,156,953 reached in June 1943. By September 1946 it was down to 2,154,000. Federal civilian employees outside continental United States had reached 854,000 in June 1945, and the number was down to 310,000 by September 1946. The total decrease in both categories from June 30, 1945 to Sept. 30, 1946 was 1,306,000. At the end of September the total number employed in the Washington, D. C. metropolitan area was 225,983, a drop of 63,000 from the high point recorded in 1943. There were 555,690 women employed full time at the end of September, 107.635 of them in the Washington metropolitan area. By September 1946 the percentage of veterans among the male employees had reached 51, the highest in the history of the Government, and the percentage was 38 for both men and women. The number of veterans employed was 825,100, as contrasted with 395,200 employed in July 1944. The accompanying table shows the number employed at the end of each fiscal year in two-year periods:

	June 30, 1938	June 30, 1940	June 30, 1942	June 30, 1944	June 30, 1946
Competitive classified positions...	562,909	726,827	*	*	**
Unclassified and exempt positions.	289,017	275,993	*	*	**
	851,926	1,002,820	2,207,754	2,918,287	2,299,007**

* Statistics showing the division between competitive classified positions and unclassified positions were not available under war service appointment procedure.

** In this number of positions approximately 1,289,000 employees had war service (temporary) appointments, approximately 71,000 employees were in unclassified or exempt positions, and approximately 940,000 employees had competitive classified status.

CIVIL SERVICE BY STATES

General.—During 1946 several state governments took action to bring pay rates of their employees in line with living costs. Among these states were California, Connecticut, Maryland, New York, Virginia, and Wisconsin.

Alabama. — The Mobile County Personnel Board limited to a period of five years following termination of the war, or five years after discharge of the veteran, whichever is later, a new veterans preference policy. This policy relates to entrance examinations but not to tests for promotion, and a passing grade is required before the veteran becomes eligible for preference. The preference is 10-points added to examination ratings for disabled veterans, wives of disabled veterans, and widows of veterans; and 5-points for other veterans.

Arizona.—Retirement systems have been approved for city employees of Tucson and Phoenix.

California. — Riverside voted to adopt the state retirement plan for all city employees. The California Supreme Court sustained the validity of allowing sick leave with pay to a state employee absent from work three days to care for his wife who was critically ill. Question had been raised whether sick leave could be granted for reasons other than actual illness of the employee. Lynwood voted to establish a personnel system covering city employees, and also adopted the California State retirement system. Certain elementary school employees in Compton were placed under a merit system effective July 1.

Georgia.—The Civil Service Board of Fulton County adopted a resolution to the effect that the beneficiary of any employee who dies while in the service will receive 15 days' pay plus all accrued vacation leave and compensatory time that the employee had to his credit.

Kentucky.—The legislature overrode a veto by the Governor and excluded from civil service coverage positions of chief and assistant chief of the Louisville police and fire departments, and withdrew from the city Board of Aldermen the power to make further extensions of the merit system by ordinance.

Louisiana.—Under revision of the civil service rules state employees who return to their jobs from military service will receive whatever pay increases they would have been entitled to if they had remained in their former positions. Another change permits employees to accumulate more than 60 working days of sick leave although no more than 60 days can be carried forward from one calendar year to the next.

Michigan.—By a 3-to-1 margin the voters in Hamtramck rejected a proposal to repeal the city's civil service law. Three members of the city council who led in an effort to repeal the law were defeated in seeking reelection. Kalamazoo adopted a new health insurance plan providing city employees with $1,000 life insurance for 60 cents a month. The city will pay the balance of premiums above the amount charged participants. The plan will not be effective unless 75 per cent of the city's employees participate.

Mississippi.—The mayor and commissioners of Jackson ordered the dismissal of a policeman who refused to resign from a labor union after being ordered to do so and warned that failure to obey would result in dismissal. The civil service commission affirmed the dismissal and ordered the city council to restore to service policemen if they applied within five days for reinstatement, coupled with a statement of renouncement of their union affiliation. On appeal the Supreme Court ruled that, in as much as the city council was elected by the people and made responsible to the people for proper conduct of every part of the city government, the police employees must be responsible to the council and must be under its direction, free from obligation of any allegiance whatsoever, so far as their activities as policemen are concerned. The dismissal was sustained.

Missouri.—Certain additional departments in the Missouri state service have been placed under the merit system by action of the state legislature. These departments are Public Health and Welfare, Corrections, and the Division of Employment Security of the Labor Department. The law also provides that employees who are now covered by the state merit system program shall come under the new system after it has been in operation for one year.

Nebraska.—The Omaha city charter was amended by vote to establish a separate civil service commission for the personnel of the city's police department. The city already has a civil service program covering the majority of municipal employees, but neither the police nor fire department was included.

New Jersey.—The veteran preference law was amended, requiring that the veteran standing highest on the list of eligibles must be appointed.

New York. — Following a suit brought by several non-veteran police officers of New York City, whose standings on promotional lists were lowered considerably when the new Veteran Preference Act was applied thereto, the New York Supreme Court upheld the application of the new veterans preference amendment to the state constitution in the case of promotional eligible lists established before the constitutional amendment became effective. A Labor Relations Bureau has been established in New York City as a part of the city government to aid in settling and avoiding strikes. This unit will also assist in handling relations between the city and its 150,000 employees, but city department heads will still be responsible for labor relations in their own administrative subdivisions.

Ohio.—The Supreme Court of the state reversed the decision of the lower courts which had agreed that the position of Director of Recreation for the City of Cincinnati could be listed in the unclassified service. It was held that the nature of the duties of the position did not bring the position expressly within the terms of the paragraph of the Ohio General Code which authorizes exemptions.

Oregon.—Both state and local government employees on July 1 became subject to the retirement system on a contributory basis.

Pennsylvania. — Honorably discharged veterans will be granted automatic salary increments in proportion to the time spent in the military service upon their return to the Pennsylvania state service.

Virginia.—The legislature passed a bill prohibiting reemployment for one year of public employees who leave their jobs on strike.

Wisconsin.—The state's municipal retirement system covers 42 cities, seven villages, 19 counties, eight school districts, and two metropolitan sewerage districts. The system was established in 1944. In Waukesha a profit-sharing plan was adopted, applying to the city's water department, under which employees of the department will receive a portion of the net profits resulting in operation of the utility. Four per cent of the utility's annual net earnings will be distributed among employees after operating expenses, taxes, and charges for depreciation have been met. The maximum bonus to a single employee is $200.

DIVISION IV

STATE GOVERNMENT

STATE ADMINISTRATION AND LEGISLATION

By Brevard E. Crihfield
Council of State Governments

GENERAL

Although 1946 was a so-called "off" year for state legislative sessions (most state legislatures meet biennially in odd-numbered years), a number of special sessions was called to consider emergency problems arising during the first post-war year. Thus a total of 25 states had their legislatures in session at one time or another during 1946, with some states holding two, three, and even four special sessions.

A major portion of the legislation enacted by the states in 1946 reflected the need for expanding services for returning veterans. College and university facilities were strained to the utmost to take care of the avalanche of veterans attending school under the G. I. Bill. Enrollments at state universities doubled in many cases and were vastly increased everywhere. Housing for veteran students and for veterans in general was a top-ranking problem for all levels of government—Federal, state, and local. Considerable pressure developed in several states for the payment of a state bonus to veterans. Many states took action to provide tax exemptions and other benefits and privileges for veterans, their dependents, and their organizations. State agencies to administer veterans' affairs, many of which had been set up during 1945, moved ahead with their programs aided by greatly increased operating budgets.

Missouri underwent during 1946 a rather comprehensive administrative reorganization of its state government as a result of changes authorized and required by a newly adopted constitution. Employment offices and unemployment compensation administration were of major importance, particularly in view of the Federal Government's returning to the states in November of 1946 the employment services which had been loaned by the states at the beginning of the war and operated on a national basis throughout the war. Tax and fiscal policy continued to be of general interest and concern to the states as pressure began to be applied for spending surpluses which had been accumulating during the war years. Public works and when to construct them were a major problem, with cost estimates skyrocketing far beyond the amounts previously appropriated to accomplish such projects. Federal legislation requiring state participation and cooperation was passed in the field of hospital surveys and construction, airport development, agricultural research, and school lunch programs, and the states began preparing to do their part of the job. Changes in the Federal Social Security Act also made it necessary for the states to review their own programs and legislation in this field.

STATE VETERANS AGENCIES

During 1946 state agencies administering veterans' affairs swung into full operation to meet the needs of the vast number of servicemen who were being demobilized. In every state there was an official agency charged with the duty and responsibility of coordinating various programs affecting veterans, and in addition, many state veteran agencies were carrying out direct programs to assist veterans through loans, welfare funds, bonuses advisory services, educational grants. and other benefits. Appropriations for such agencies ranged from a few thousand dollars in the smaller states to upwards of $1,000,000 in California Illinois, New York, Washington, and Wisconsin. On Nov. 13-15, 1946, the Retraining and Re-employment Administration of the Federal Government sponsored a conference of state directors of veterans' affairs held in Washington which was attended by delegates from 43 states. The purpose of the conferences was to promote closer cooperation between Federal and state agencies administering programs relating to veterans. An important result of this meeting was the formation of an organization to be known as The National Association of State Directors of Veterans' Affairs. Homer Bradney of the Illinois Veterans' Commission was selected to be the first chairman of the Association. The organization was formed to provide a medium for the exchange of ideas and information, to facilitate reciprocal state services, to foster a better understanding of national problems affecting veterans, to secure improved standards of service in all states, and to maintain and foster interest in the readjustment of the veteran and in veterans legislation.

STATE VETERANS PROGRAMS

A recent survey of state veterans programs as they were operating during 1946, shows that virtually all the states have well established programs of apprenticeship training for veterans, with as many as 18,000 veterans participating in some of the larger states. About two-thirds of the states give civil service employment preference to all veterans by law, such preference being most common with respect to appointment, retention, and reinstatement. About one-fourth of the states have special programs covering medical aid and hospitalization for veterans. All of the states are supervising and administering, in cooperation with the Federal Government, On-the-job Training Programs for veterans. About one-fourth of the states have programs which provide for the granting of various types of loans to veterans, such loans ranging from the small emergency type to those for the financing of farm and home purchases or the establishment of a business. Over half the states have enacted special tax legislation providing exemptions for veterans, and most of the states exempt veterans from various types of licensing requirements. Every state provides vocational rehabilitation for physically handicapped veterans. Special state relief and welfare programs for veterans are found in more than half of the states.

VETERANS EDUCATION

California appropriated $750,000 to be used during the current school year for direct educational assistance to veterans; up to $1,000 may be spent to further or complete the education of any individual veteran. California also took legislative action to provide correspondence instruction and apprenticeship training for veterans. Louisiana provided state aid for the education of children of deceased veterans. Maine appropriated $250,000 to provide emergency facilities at the state university, principally for the benefit of returning veterans. Massachusetts established a new college for veterans at Fort Devens, authorized communities to provide college courses for veterans, and made available free university extension courses for veterans. Michigan set aside $200,000 as an emergency loan fund to assist veteran students. New York established five institutions of applied arts and sciences, with an admission preference for veterans; liberalized the amount and increased the number of its state war service scholarships; and authorized its Commissioner of Education to contract for emergency instruction of veterans.

A great many states made emergency supplemental appropriations to their universities to provide expanded facilities to meet increased enrollments of veteran students.

VETERANS HOUSING

Most of the states made funds available for providing temporary housing at state universities, and others authorized bond issues for the construction of permanent dormitories. California appropriated $7,500,000 to aid communities in acquiring emergency housing facilities from the Federal Government for the benefit of veterans, with 90 per cent of the cost being borne by the state. Connecticut appropriated $5,000,000 for the same purpose, except that the state and the locality are to bear an equal share of the costs. Connecticut also set up a revolving fund to provide lumber from state forests to be used solely for veterans housing. Massachusetts passed an enabling act to permit local communities to take various emergency measures to provide shelter for veterans.

A number of states empowered their political subdivisions to participate in the Federal Government's program for providing emergency housing for veterans. New Jersey gave its department of economic development sweeping powers to acquire land, buildings, and other facilities for emergency housing, and appropriated $6,000,000 for this purpose. In November, 1946, the voters of New Jersey approved a bond issue of $35,000,000 to further implement this act with particular reference to housing for veterans. New York created a joint board for emergency housing of veterans and others, with broad powers to acquire and construct housing facilities. An emergency housing fund of $35,000,000 was appropriated from the post-war reconstruction fund to carry out the purposes of this act. Ohio appropriated $6,000,000 to its counties, allocated on a population basis, to provide temporary emergency housing for veterans. Numerous municipalities were granted specific authorization to go ahead with emergency housing programs.

VETERANS BONUS LEGISLATION

Early in 1946 Massachusetts supplemented its 1945 bonus measure by providing for payment of an additional $100 to veterans who had not served outside the United States, and an additional $200 to those who saw service in foreign countries or Alaska.

In September, 1946, the voters of Maine defeated on referendum a proposal to pay a state bonus of $150 to veterans of the Second World War. The referendum was on a $16,000,000 bond issue to be repaid by increased cigarette and liquor taxes and a special luxury tax.

In November, 1946, the voters of Illinois, Michigan, and Rhode Island approved bond issues for the payment of bonuses to veterans as follows: Illinois—a bond issue of $385,000,000 to pay a bonus of $10 per month of domestic service and $15 per month of foreign service, such bonds to be serviced by increased taxes on racing, cigarettes and if necessary by a general property tax; Michigan—a bond issue of $270,000,000 to pay bonus of $10 per month of domestic service and $15 per month of foreign service with the total bonus not exceeding $500, the method of financing being left to the legislature; Rhode Island—a bond issue of $20,000,000 to pay a flat bonus of $200 per veteran, no special tax action provided to repay bonds. During 1946, the New York legislature also took action on a bonus measure which would require bonds amounting to $400,000,000. If passed again at the 1947 session, this proposal will go to the electorate for approval in November, 1947.

VETERANS EMPLOYMENT

California, Kentucky, Louisiana, Minnesota, Massachusetts, Mississippi, New Jersey, New York, Ohio, and Virginia enacted measures further strengthening employment preference for veterans in the state civil service or granting re-employment rights to servicemen returning to state positions. Included in these enactments were increases in entrance examination credit for veterans, waiving of certain physical requirements for veterans in appointments in state positions, deletion of period of military duty in computing age if there are maximum age requirements for a position, and restoration to civil service lists after discharge for veterans who passed examinations prior to entering armed forces.

LICENSE AND TAX EXEMPTIONS FOR VETERANS

California, Kentucky, Louisiana, Massachusetts, Michigan, Mississippi, New Jersey, New York, Ohio, Virginia, and Wyoming passed laws to grant veterans various exemptions from taxes and licensing requirements. These included exemption from penalties and interest in connection with property taxes for individuals while in armed forces; increased exemption and extension of time of payment for veterans in paying state income tax; flat property tax exemption for disabled veterans; exemption from payment of poll taxes; automatic reinstatement of veterans who held licenses granted by state boards; exemption from examination for veterans otherwise qualifying for various state licenses; credit for army experience in qualifying for certain licenses, etc. In the November election, the voters of Louisiana approved a constitutional amendment providing a homestead exemption (until 1951) of $5,000 for veterans buying or building new homes, and the voters of Arizona approved an extension of the existing property tax exemption of $2,000 to veterans of the Second World War.

MISCELLANEOUS VETERANS LEGISLATION

The California legislature set up an integrated state department of veterans affairs in which were placed the various functions and programs relating to veterans which had previously been administered by a number of independent bureaus. Separate divisions of the newly organized department will handle farm and home purchases, educational assistance, and domiciliary care. In November the voters of California approved a $100,000,000 issue of veterans' aid bonds which will be used to finance home purchases of up to $7,500 and farm purchases of up to $13,500. The Massachusetts legislature adopted a resolution calling for a survey of post-war problems relating to economics, housing, and the need for a $50,000,000 loan fund for veterans.

Mississippi enacted a farm and home loan act to assist qualified veterans in buying a home or farm to cost not more than $5,000 where it can be shown that such veterans have been unable to obtain loans in their own community. The voters of Texas, in a special election held during November, 1946, approved a bond issue of $25,000,000 to finance the purchase of land which will be resold to veterans on easy terms. Several states took action to permit veterans under age 21 to obtain certain benefits under the G. I. Bill (thus removing so-called "minority disability").

STATE FINANCE AND TAXATION

During the fiscal year 1946, state tax collections reached an all-time high of approximately $6,000,000,000, thus continuing an uninterrupted upward trend which began in 1937. Total collections for the fiscal period ended in mid-1946 represented a 6.2 per cent increase over receipts for fiscal 1945, marked a 34.7 per cent gain over 1941 collections, and exceeded 1937 collections by 77.2 per cent.

Payroll, general sales, motor fuel, and income taxes accounted for 61.6 per cent of all 1946 state tax revenues. Payroll taxes alone accounted for 17.4 per cent of state tax receipts, totaling $1,030,000,000. Though the biggest single item in 1946 collections, this figure is still somewhat less than the previous year's $1,250,000,000 total. The decline is accounted for by reduction of overtime pay, shift of war-workers to lower-paid jobs, and the effect of strikes throughout industry. Motor fuel tax receipts, following termination of gasoline and tire rationing, surged upward to second place in nationwide state tax collections for 1946 with a $900,000,000 total, greatest since 1942's $942,000,000 all-time high. The 1946 total amounts to 15.1 per cent of the total state tax revenues for the year. Riding the crest of holiday consumer spending following V-J Day, general sales tax receipts for 1946 rose to $901,000,000 and accounted for 15.1 per cent of all state tax collections.

The greatest gain in a single tax category during the last five years was in revenues from individual and corporate income taxes, which rose from $523,000.000 in 1942 to $831,000,000 in fiscal 1946, representing a 14.1 per cent slice of the total state tax dollar. Individual income tax receipts continued upward, rising to $395,000,000 from 1945's $360.000,000. Corporate income taxes, meanwhile, sagged from $454,000,000 in 1945 to $436,000,000 in 1946, reflecting the drop in corporate profits following war production shutdowns. Revenue from motor vehicle license, alcoholic beverage, and tobacco taxes for fiscal 1946 was considerably above that for any preceding period of the past five years. Totals were $456.000,000, $400,000,000, and $199,000,000, respectively.

State tax legislation with the exception of financing for veterans' benefits was not especially significant in 1946. The number of states using sales, income, and tobacco taxes remained unchanged, and sales tax rates were also unchanged. The personal income tax in New York was reduced 50 per cent. and the permanent 4½ per cent corporate rate was reinstated. A novel tax was imposed by South Carolina on wholesalers and retailers of liquor. The law requires that they absorb the amount of the tax. Missouri enacted a new intangibles tax law. Missouri also established a new department of revenue in which were consolidated the tax administering functions formerly exercised by the auditor, treasurer, and other state agencies. This department was created pursuant to the new constitution in Missouri. Mississippi created an office of motor vehicle comptroller to take over the administration of the gasoline tax.

State legislatures during 1946 passed a total of 66 major bills regulating highway users, including an increase in the motor fuel tax rate in Virginia from five to six cents. Mississippi raised its tax on motor fuels other than gasoline from six to seven cents. New York extended a two-cent emergency gas tax. Seven states enacted major laws on registration fees, most of them concerning trailers and commercial carriers. Registration fees were reduced in Virginia and Mississippi. At the November election the voters of Texas approved a constitutional amendment prohibiting diversion of motor fuel revenues, thus becoming the 19th state to prohibit diversion of highway funds by constitutional provision.

Georgia and Kentucky revised registration fee schedules for commercial carriers, providing lower minimum charges. Missouri also revised its registration regulations. New Jersey, the only state to increase registration fees, decided to charge more for registration of commercial vehicles, trailers, semitrailers, and tractors.

PUBLIC WELFARE

During 1946 New York enacted the outstanding state legislation relating to public welfare. The measure, Chapter 200, gave legal authority to the State Department of Social Welfare and local welfare departments to proceed with optional plans for developing integrated public welfare services throughout the state. The first major objective of this legislation is the integration of services to the needy, including provision for a single office in which persons may apply for all types of public assistance and aid, the investigation of family needs by a single agency, and uniform standards of assistance and care within individual counties. A great degree of flexibility is permitted under this plan, and many options are available to the various political subdivisions although the basic pattern will be that of county plans of administration. Approval and annual review of local plans by the State Department are required.

A second and somewhat radical change abolishes the former cumbersome and costly "settlement" system in New York and substitutes a more easily administered residence requirement. Settlement laws governing the eligibility of applicants for public assistance date back for nearly 200 years and have caused hardship to the needy and made trouble for welfare officials. The third major feature of the legislation is the stabilization of state aid to local districts for support of welfare payments and administration. This fixes the local share of welfare costs at 20 per cent, the balance being absorbed by the state. The financing of public welfare, particularly during times of depression, has been a major problem in most local communities and this new reimbursement program is expected to lighten considerably the financial burden of local governments and permit sounder fiscal planning on their part. The concept of state-local cooperation in the field of public welfare embodied in this three-point program has attracted the attention of state officials throughout the country and may start a trend toward consideration of similar action in other states.

Missouri, as a result of its new Constitution, took action in 1946 to create a department of health and welfare which will combine within a single agency a number of previously independent boards and commissions. The department is to be headed by a director appointed by the Governor for a four-year term concurrent with his own term of office. There are three divisions of the department—health, mental care, and welfare—each headed by a director also appointed by the Governor. A merit system governing employment throughout the department is provided.

Kentucky passed enabling legislation to permit a city and county to create a joint board of public welfare which would consolidate and combine all welfare activities previously administered separately. Massachusetts revised its laws regulating aid-to-dependent children and laws relating to soldiers' relief. Mississippi authorized the establishment of additional local public welfare agencies in certain districts and empowered the State Welfare Department to administer and supervise all public child welfare services.

New Jersey enacted legislation to consolidate and coordinate municipal public assistance activities and to abolish the office of Overseer of the Poor. Ohio made a number of changes in its laws relating to old age assistance. South Carolina amended its laws so as to shorten the period of residence necessary for a person receiving old age assistance or aid to the blind. Virginia authorized its state welfare agency to fix standards and make regulations for the operation of homes for the aged and infirm and to assist in the establishment of a statewide system of such homes. Virginia also created a special legislative commission to study and investigate public assistance. A number of state legislatures adopted resolutions memorializing Congress to liberalize in various ways the existing Federal social security program.

California, Idaho, Kentucky, Massachusetts, Michigan, Mississippi, New Jersey, New York, Rhode Island, South Carolina, Virginia, and Wyoming enacted legislation affecting the public assistance programs, including assistance to the aged, the blind, the infirm, and dependent children. Many of these states paid particular attention to juvenile delinquency.

STATE LABOR LEGISLATION

In New Jersey a comprehensive law was enacted governing the industrial relations of public utilities, under which the State Board of Mediation is authorized to settle controversies concerning representation for collective bargaining purposes; the Governor is empowered to seize and operate any utility for the duration of a labor dispute. Laws restricting the action of labor unions and outlawing certain types of picketing were enacted by Louisiana and Virginia. At the November election, the voters of Arizona, Nebraska, and South Dakota gave substantial majorities to proposals to ban the closed shop, adopting language prohibiting the denial of employment to any person because of non-membership in a labor organization. Massachusetts voted, by a two-to-one margin, to approve a proposal to require that labor unions make public their financial reports.

Pursuant to its constitutional revision, Missouri established a new department of labor and industrial relations. The department is to be administered by a commission of three members, and several divisions are established to administer different types of labor laws. Massachusetts established a Fair Employment Practices Commission and forbade employment discrimination because of race, creed, etc., but the voters of California defeated a similar proposal in the November election. Alabama, California, Georgia, Kentucky, Massachusetts, New York, and Virginia enacted legislation affecting workmen's compensation, some of the legislative changes being of major importance.

New York passed two laws regulating the recruitment and housing of migratory workers. Massachusetts became the fourth state to extend minimum wage legislation to men. Rhode Island prohibited wage differentials based on sex for work of comparable character, and also set up an industrial code commission which is authorized to establish codes for the prevention of accidents and occupational diseases.

CHILD LABOR

California repealed its emergency war employment act which had given the Governor the power to relax standards with respect to employment of children. Georgia adopted a new child labor act which increased from 14 to 16 the minimum age for work at any time in mines, factories, laundries, etc., and which established a maximum 8-hour day, 40-hour week for children under 16 years. Kentucky increased the compulsory school term for children from 7 to 8 months. Louisiana made permanent a wartime relaxation permitting 12- and 13-year-old boys to deliver newspapers on fixed residential routes. Massachusetts enacted several laws dealing with child labor, including a new law limiting to 4 hours a day or 24 hours a week the work which may be performed on farms by children under 14 years of age. The Mississippi legislature provided for the creation of a commission to make studies of and recommendations for specific legislation pertaining to children, including amendments to present laws. In New Jersey a proposal to abolish the State Commission on Student Service was vetoed by the Governor. New York amended in several respects its labor laws with regard to employment of children. Virginia revised its child labor law pertaining to the delivery of newspapers by children of various ages.

MEDICAL—HOSPITALS

A trend toward more rigid licensing and regulation of the medical profession continued in 1946. Many bills were introduced regulating certain types of drugs such as hormones, hypnotics, and the barbiturates. Massachusetts, New York, and Virginia enacted legislation in this field. Pharmacy practice acts were strengthened in Kentucky, Massachusetts, and New York, and trades such as cosmetology and barbering came under stricter regulation in New York. Chiropractic regulatory acts were strengthened in Kentucky, Maryland, and South Carolina. Dental technicians were required to be registered in South Carolina. Psychologists, osteopaths, and midwives also came under regulation in a number of states.

Mississippi provided funds for the eradication and control of venereal diseases, and New York, Virginia, and Idaho provided additional care for those suffering from tuberculosis. A New Jersey act authorized the establishment of blood banks to collect and store blood and blood plasma, while Massachusetts authorized approved laboratories to examine blood donors or recipients of blood. Special studies of spastics and their problems and of the causes of infantile paralysis were authorized in New York and Massachusetts, respectively. Medical education was furthered in California by appropriations for the establishment of a medical school and center and for additions to existing facilities. A four-year medical school was authorized in Mississippi and an appropriation was made for a new board of medical education. Nutritional problems will be surveyed in New York by a joint legislative committee with broad powers.

California, Michigan, Mississippi, New York, South Carolina, and Virginia followed recommendations in the legislative program of the Council of State Governments by authorizing hospital surveys and by providing for the acceptance by the state of Federal funds when available for such hospital inventories and construction costs. Special health commissions or medical care surveys were authorized in Massachusetts, Mississippi, New York, and Rhode Island. California appropriated funds for the licensing and inspection of public and private hospitals, while Georgia, Massachusetts, Mississippi, and Virginia adopted a number of bills requiring the inspection and regulation of hospitals and nursing homes. In some instances the bills amended existing statutes.

California, Massachusetts, Michigan, and Virginia recognized the increasing problem resulting from mental diseases and provided additional facilities for the treatment of the feeble-minded and those affected with nervous and mental diseases. Louisiana enacted a mental health act to provide for the study and treatment of such diseases. Hospital care and medical service plans were authorized or broadened in Kentucky, Mississippi, New York, South Carolina, and West Virginia. In New York medical service plans may provide for dental expense indemnity.

EMPLOYMENT SERVICES

On Nov. 16, 1946, the employment services were returned to state operation after almost five years of operation as a Federal agency (United States Employment Service). Shortly after Pearl Harbor, the system of public employment offices was nationalized by executive order of President Roosevelt, on the ground that it could function better during the war period on a nationwide basis. The Governors of the 48 states agreed to the transfer as an emergency measure but with the understanding that the employment services would return to their respective states at the end of the war. President Truman wanted the agency to continue on a national basis at least until mid-1947, certain other groups wanted the system on a permanent basis, but Congress wanted it returned to the states promptly. During 1945 and 1946 the states had been engaged in a strenuous effort to secure the return of their employment offices at the earliest possible moment. November, 1946, was a compromise date.

In order to insure that this service would be rendered in an adequate manner and that the transfer of these services from Federal to state control would be handled smoothly and expeditiously, the Council of State Governments held many conferences with state and Federal officials. Four regional meetings, covering all of the states, were held during August and September, 1946—immediately following passage of the bill returning the employment service to the states—with the result that the employment service is now under state control and state operation, integrated with the state unemployment compensation activities so as to provide a comprehensive employment security program in each state.

UNEMPLOYMENT COMPENSATION

The year 1946 saw state unemployment compensation systems take in stride the unemployment burden attendant upon reconversion, despite earlier predictions from several quarters that the states would be unable to handle this problem. During 1944-45, the Council of State Governments had developed and promoted a specific program for improving, expanding and perfecting unemployment compensation. This program was adopted so extensively by the states during 1945 that the *Social Security Bulletin,* official publication of the Federal Security Agency, declared that "the improvements which have been made in the program are impressive." As a result, Congress was convinced that Federal action to supersede or supplement state provisions was not necessary, and several bills introduced to accomplish that end were defeated in the 79th Congress.

During 1946, the financial condition of the state unemployment insurance systems remained excellent, and although benefit payments exceeded current income from payroll taxes, nevertheless, the balance at the end of the 1946 fiscal year still closely approached $7,000,000,000. With respect to state unemployment compensation legislation during 1946, California took action to provide disability benefits as a supplement to its unemployment insurance act, thus making it the second state to make such benefits available (Rhode Island being the other).

Kentucky and Missouri amended their laws to provide for reorganization of their unemployment compensation agencies. Louisiana extended its coverage to include maritime workers. Rhode Island, California, Louisiana, Michigan, Virginia, New York, and Missouri made changes in the financing provisions of their unemployment compensation laws. Massachusetts increased its maximum weekly benefit amount from $21 to $25; Missouri increased the amount from $18 to $20. Virginia increased its minimum weekly benefit amount; Missouri increased the duration of benefits; and Massachusetts provided an additional benefit for dependent children. New York provided for payment of benefits to veterans who are disqualified solely because unemployment is owing to a work stoppage caused by a labor dispute.

AVIATION

At the November election, the voters of Michigan approved a constitutional amendment permitting the state to expend funds for constructing airports, and to assist localities by monetary grants for such construction. Massachusetts and Wyoming enacted measures requiring that Federal grants for the construction of public airports be channeled through established state aviation agencies and that such projects be approved by the state agencies. Kentucky and Virginia passed measures affecting their state aviation agencies. California, Michigan, New York, South Carolina, and Virginia passed bills dealing with airports and air navigation facilities. Georgia and Kentucky enacted legislation relating to airport zoning. Virtually all of the states holding legislative sessions during 1946 enacted miscellaneous measures affecting some phase of aviation development or regulation.

STATE SALARY ADJUSTMENTS

During 1946 a number of states made wage and salary adjustments for their employees, some of which were on a tentative basis relating to changes in the cost of living. In California the state personnel board made a war emergency salary adjustment part of the permanent salary structure, approved an additional salary increase, and created a staff to review and adjust individual classifications. In Colorado, the state civil service commission recommended salary increases ranging from 6 to 18 per cent for classified employees, such action subject to legislative approval in January, 1947. Connecticut authorized an increase based on a sliding scale to give lower salaried employees the most benefit. Indiana approved salary increases ranging from about 5 to 18 per cent.

The Maine legislature in special session approved a cost-of-living increase for a six-month period and will reconsider this matter at the regular 1947 session. In Maryland general salary increases ranging from $320 to $500 per year were authorized by administrative action. New York put into effect a five-step plan of increases ranging from 14 to 30 per cent, this action being temporary pending the outcome of a wage study being conducted by a research staff. Virginia discontinued its temporary war adjustments and in lieu thereof established a salary plan based on an increase of 24 per cent on the first $1,200 of salary with descending percentage increases on additional salary. Wisconsin put into effect a $10 per month increase on a temporary basis pending action by the 1947 legislature.

MISCELLANEOUS LEGISLATION

California enacted legislation providing that in the future the legislature shall meet in annual rather than biennial sessions. In even-numbered years the legislature will consider only the budget and urgent matters requiring legislative attention. In the odd-numbered years the legislature will consider matters usually taken up at a regular legislative session. On the other hand the voters of Connecticut defeated a proposal for annual sessions of the legislature.

Virginia adopted a subdivision control law for counties, cities, and towns, authorizing the control of subdivisions adjacent to municipal limits, permitting joint control by two cities or by a city and county, and enabling localities to adopt the provisions of the law by ordinance.

At the November election voters in four states approved tax measures increasing state aid to local schools. These were California, Michigan, Oregon, and Utah, and the resultant increase in state school aid is expected to total at least $80,000,000 annually. In addition, Maryland, New York, Ohio, South Carolina, and West Virginia completed studies having the twin objectives of meeting educational needs and providing a guide for long-range expansion and improvement of higher education.

In the field of municipal finance, several states took action to assist political subdivisions. New York put into effect the so-called "Moore Plan," designed to bring about a more stable and equitable method of state assistance to municipalities for their general governmental purposes. Under this plan the old system of shared taxes will be abolished, and instead moneys will be distributed to municipalities on the basis of their respective populations. Michigan voters approved a constitutional amendment which provides for the refunding to cities and schools of one cent of the state's three-cent sales tax. This is expected to provide approximately $60,000,000 per year to be divided equally by local schools and cities. California enacted a measure which provides for the distribution of $90,000,000 to various political subdivisions of the state. Arizona provided that henceforth the cities of that state shall receive a share of all gasoline taxes collected by the state.

NATIONAL AND INTERSTATE RELATIONS OF THE STATES

By Frederick L. Zimmermann
New York Joint Legislative Committee on Interstate Cooperation

GENERAL

Basic to any discussion of national and interstate relations of the states is a recognition of recent trends with respect to the eternal question of determining the relative roles of the national and state spheres of government in American federalism. These underlying trends have been outlined at some length by this article in previous years. It will suffice to review them briefly here.

As has been pointed out, the United States Supreme Court has tended to retreat from its traditional role as the umpire of the Federal system. The trend of judicial interpretation has been toward the elimination of any broad constitutional check upon the extension of the functions of the National Government. At the same time, the Court seems to be broadening the sphere of state action within the constitutional framework of the American Federal system by refraining from imposing narrow constitutional limitations upon such action. As a result, Congress has increasingly become the forum for the determination of the relative role of the nation and the states in the American Union. The states, accordingly, have tended to turn to the Congress to present their case, utilizing for that purpose the Council of State Governments and the associated Governors' Conference.

The Council of State Governments, a joint organization of the state governments completely supported by them, is itself emblematic of the more effective organization of state governments during recent years to counter the growth of centralization. Not only has the Council come to be regarded as the spokesman for those governments at Washington but it has been notably effective in that role. The position of the states with respect to Federal-state relations has been in general to emphasize the building of cooperative government in the federalism as against the tendency toward centralization and, to that end, to seek the fashioning of a cooperative pattern as between all levels of government and the channeling of the administration of new programs through the extant machinery of government. As a means for securing more effective Federal-state relations the Council has been gradually developing new and more institutionalized channels of Federal-state cooperation as evidenced by the machinery embodied in the Committee of State Drafting Officials and the Federal-State Relations Section of the U. S. Department of Justice.

RETURN OF EMPLOYMENT SERVICE TO THE STATES

Some of the notable struggles in the last Congress revolved around Federal-state issues. Outstanding were the question with respect to the return of the employment service to the states, the issue as to whether the Federal or state governments owned submerged coastal lands (the "tidewater" controversy), and the battle, with the state governments on one side and the city governments on the other, over national airport legislation. With the possible exception of the airport legislation, it would appear that the states were generally successful in securing the support of Congress in these controversies.

The return of the employment services to the states, effective Nov. 15, 1946, marked a real triumph for the state governments after long efforts toward that objective. To review the story in outline, on Dec. 18, 1941, President Roosevelt requested the transfer of the state employment offices to the Federal Government as a wartime measure. The states acquiesced in this request but with the understanding that, at the close of the war emergency, the employment services offices would be returned to the states to be operated as before under state administration through a Federal-state cooperative pattern. From time to time, the states, through the Governors' Conference and the Council, reiterated their expectation that the employment services would ultimately be returned to them.

In the meantime, there had developed considerable agitation for retention of the employment services by the Federal Government principally on the grounds that unemployment was a national problem and that the employment services would therefore be best administered on a national basis. On their side, the advocates of state administration argued that, while the problem is national, employment occurs at the local level. Moreover, they pointed to the need for integrating the employment services with unemployment insurance which is administered by the states. With the termination of hostilities with Japan, the executive committee of the Governors' Conference met with President Truman to discuss the question. While the President agreed in principle as to the ultimate return of the services to the states, he was against immediate return and in a subsequent message to Congress opposed such return earlier than June 1947. When Congress, late in 1945, attached a rider to an appropriation bill providing for the return of the employment service facilities to the states within 100 days, the bill was "pocket vetoed" by the President. However, in the 1946 session of Congress, efforts for such action were renewed, and legislation to that effect finally prevailed. With the return of the employment services to the states, the Council of State Governments called four regional meetings covering all the states in order to facilitate a smooth transition from Federal to state operation and to assist in the development of improved standards and procedures in the administration of the employment service. This is in accordance with the Council's position that, if the states are to maintain their role, they must meet their responsibilities effectively.

The return of the employment services emphasizes the already apparent victory of the states with respect to the underlying issue as to whether unemployment compensation is ultimately to be administered through the present Federal-state cooperative pattern or by the Federal Government directly. Moreover, the recommendations of the Council of State Governments, that the states strengthen their provisions for such unemployment insurance, has been generally heeded. It is significant that almost all the state legislatures meeting in 1945 and 1946 expanded their employment security programs to meet the needs of the time. It is clearly evident that, for the foreseeable future, employment security will continue to be administered through the states.

MARITIME SERVICES IN EMPLOYMENT COVERAGE

The decision of the Congress in the field of unemployment compensation was underlined by Congressional action during 1946 that insured coverage of maritime services in the extant system of unemployment coverage under state administration rather than through a separate Federal unemployment insurance system for seamen. Certainly, if there is any aspect of unemployment insurance for which an argument can be made for direct Federal administration on the basis of past practice in our constitutional system, it is maritime coverage. Yet, state coverage for maritime workers was made certain on a permanent basis when Congress in the Social Security Amendments of 1946 brought employers of seamen under the three per cent Federal unemployment tax and authorized state legislatures to enact state unemployment taxes on such maritime employers which may be credited against the Federal tax.

Federally financed benefit payments to seamen who were employed by the War Shipping Administration may also be handled by the states under authorization to the Federal Security Administrator to enter into agreements with the states for this purpose. The final element in swaying the Congress in this matter, after a struggle of more than three years, seems to have been the success of the states through the Interstate Conference of Employment Security Agencies in formulating interstate reciprocal arrangements with respect to jurisdiction.

The Interstate Maritime Reciprocal Arrangement, which covers not only offshore operations but also operations on inland waterways if they are not connected with those on the Great Lakes, has been accepted by Alabama, Alaska, California, Florida, Louisiana, Maryland, Nebraska, New Jersey, New York, Pennsylvania, Texas, Virginia, and Washington. The Interstate Great Lakes Reciprocal Arrangement extends only to maritime service "which is performed on the Great Lakes or inland waterways connected therewith" and has been accepted by Illinois, Indiana, New York, Ohio, and Wisconsin. The allocation of maritime services for tax purposes under these arrangements is in full accord with the specific provisions added to the Federal Unemployment Tax Act in 1946 since they provide for coverage of services on vessels in that state where the employer maintains the operating office from which the operations of the given vessel are "ordinarily and regularly supervised, managed, directed and controlled."

SUBMERGED COASTAL LANDS

The states were not as successful as regards the controversy over submerged coastal lands. In brief, this dispute arose when Federal officials, after many years of seeming recognition of state ownership of such lands rather suddenly asserted Federal title despite a long line of Supreme Court decisions which, as the states see them at least, have upheld state title to these lands. Federal officials reply that none of these cases rested on the specific issue of ownership. On the practical side, the states point out that, relying on these decisions, the state governments and their local subdivisions have spent large sums in reclaiming or improving these lands that such lands granted them to private owners and improved by those owners have been a great source of taxable wealth, that the states have leased these lands for shrimp and oyster fisheries and for the extraction of sand, gravel, and minerals, particularly oil, to the benefit of state revenues and that the claims of the Federal Government would revolutionize this situation to the point of confusion. While the Federal Government brought suit against the State of California to obtain a judicial determination of this matter, the battle was carried to Congress where it was enlivened by a welter of charges and counter charges, usually in relation to the oil industry. In 1946, Congress enacted legislation designed to give the states clear title to such land from the highwater mark to a line three miles at sea. The President vetoed the legislation on the grounds that the matter was before the Court for determination and the legislation failed of passage over his veto. Indications are, however, that the struggle will be continued in the 80th Congress.

GRANTS-IN-AID FOR AIRPORTS

The states, on the face of things seemingly suffered a major setback with respect to national legislation for grants-in-aid for airports. As has been pointed out in previous issues of this article, the question involved here was a fundamental one from the point of view of the states, namely, whether the administrative system for the airports should be based upon the pattern of Federal-state cooperation which has hitherto been customary with the grants-in-aid channeled through the state governments or whether the Federal Government would deal directly with the local governments. The Federal Airport Act as finally approved May 13, 1946 authorizes the Administrator of the Civil Aeronautics Administration to prepare a national plan for the development of airports in the United States, authorizes the appropriation of $3,000,000 for preliminary surveys and planning, authorizes the appropriation of $500,000,000 over a period of seven fiscal years to be matched by state and local governments, for the construction of airports; and permits the Civil Aeronautics Administration to deal directly with any political subdivision in the United States without reference to the states in the development and construction of airports.

The Council of State Governments, the Governors' Conference, and the National Association of Attorneys General opposed the bill on the ground that the measure, in bypassing the states, would lead to inefficient administration of the airport program. The long and bitter struggle over the bill extending over a year and a half finally resulted in the inclusion of an amendment to the measure as finally passed which reads as follows: "Nothing in this Act shall authorize the submission of a project application by any municipality or other public agency which is subject to the law of any State if the submission of such project application by such municipality or other public agency is prohibited by the law of such state." In other words, if the states wish the national airport system developed in accordance with state plans and state programs and their local subdivisions to operate through state agencies rather than directly with Federal bureaus, the states can enact legislation to that end.

As might be imagined, the 1946 Governors' Conference urged the enactment of state legislation specifically requiring that Federal grants-in-aid for airport construction be expended in the states only upon receiving the approval of the state aviation agencies. A number of states have already amended their aviation laws requiring their political subdivisions to operate through regularly constituted state aviation agencies and also requiring that Federal grants-in-aid for the construction of airports shall be channeled through the state governments. The Council of State Governments is recommending the enactment of legislation of this character by the 1947 state legislatures. So that, while the Federal Airport Act deviated from the traditional intergovernmental pattern in permitting direct relations between the Federal and local levels of government with respect to Federal grants-in-aid, the amendment cited above may make possible ultimate state victory on the airport issue.

FEDERAL GRANT-IN-AID LEGISLATION FOR HOSPITALS

The 1946 session of Congress was notable with respect to Federal grant-in-aid legislation. Three new grant-in-aid systems were established. Besides grants-in-aid for airports, the Congress also initiated new grants-in-aid for the planning and construction of hospitals and for school lunches. In addition, Congress expanded the extant grant-in-aid systems with respect to agricultural research, vocational education, and social security. The so-called Hill-Burton Act provides for Federal cooperation through grants-in-aid to the states in health and hospital surveys and in the construction of hospitals throughout the country. The act authorizes the appropriation of $3,000,000 to aid the states in surveying the need for construction of hospitals and the development of programs for the construction of "such public and other non-profit hospitals as will, in conjunction with existing facilities, afford facilities for furnishing adequate hospital, clinic and similar services to all people" and authorizes the appropriation of $75,000,000 a year for five years for the construction of public and other non-profit hospitals.

In order to participate in this program the states must establish the necessary machinery, including the designation of a single state agency as the sole agency for the administration of the plan, the formulation of a hospital construction program setting forth the relative need for the several projects contained within such program, and the provision of methods of administration, including those relating to the establishment and maintenance of personnel standards on a merit basis, and must enact legislation by July 1, 1948 providing that compliance with minimum standards of maintenance and operation shall be required in the case of hospitals which shall have received Federal aid under the act. If a state fails to act in this matter by the stipulated date it shall not be entitled to any further allotments.

NATIONAL SCHOOL LUNCH ACT

In the National School Lunch Act Congress authorizes "such sums as may be necessary" to aid in supporting school lunch programs in public and non-profit private schools of high school grade and below. The Secretary of Agriculture shall apportion among the states not less than 75 per cent of the yearly appropriation on the basis of the number of school children between 5 and 17 years in the state and the need for assistance as indicated by the relation between per capita income of the state and that of the United States. In states, where the constitutions prohibit the reallocation of funds to non-profit private schools, the Secretary of Agriculture is permitted to allot funds directly. Federal funds are to be matched from 1947 to 1950 by state and local funds on a dollar-for-dollar basis, but the matching increases progressively as follows: 1951 to 1955, one and a half state dollars to one Federal dollar; 1956 and thereafter, three state dollars to one Federal dollar. When a state maintains separate schools for minority races, "a just and equitable distribution" of funds for their benefit must be made.

GRANTS FOR AGRICULTURAL AND SOCIAL AID

In addition to these new grants, Congress expanded activities, made more money available, and added new functions with respect to agricultural research. Particular emphasis was placed on the expansion of marketing research. The amounts of grants-in-aid for vocational education were also increased while the Social Security Amendments of 1946 raised the ceilings for Federal matching with respect to the three categories of grants-in-aid, old age assistance, aid to dependent children, and aid to the blind. The maximum amount subject to Federal matching for old-age assistance and aid to the blind was increased from $40 to $45. Of the first $15 of such expenditures, the Federal Government would pay two-thirds. Of the remaining expenditures not exceeding $45, the Federal Government would pay one-half. The Federal Government would also pay an amount equal to one-half of the total sums expended and found necessary by the Administrator for the proper and efficient administration of the state plan.

The maximum amount subject to Federal matching for aid to dependent children was increased from $18 for the first child in a family and $12 for each additional child to $24 and $15 respectively. Of the first $9 of such expenditures, the Federal Government would pay two-thirds. Of the remaining expenditures not exceeding the maximum subject to Federal matching, the Federal Government would pay one-half.

One effect of this change is to provide bonus Social Security payments to all states alike of $5 a month for each aged and blind person and $3 for each dependent child. The increase in amount subject to Federal matching will also provide additional funds for those states making assistance payments up to the new maximums. Several states are amending their public assistance plans to increase the allowed state maximum on individual payments up to the new ceilings now subject to Federal matching.

The increase in ceilings on payments to which Federal matching would apply in social security caused a demand in Congress for variable grants that would permit the Federal Government to carry a larger share of the burden in the poorer states. After a struggle in Congress the principle of variable grants in social security was defeated. The hospital and school lunch legislation, on the other hand, tends to recognize the variable grants principle.

INSURANCE REGULATION

The action of Congress in placing a requirement for state action in the airports legislation emphasizes the use of a similar device in connection with the insurance legislation of 1945 where Congress granted a moratorium on the operation of the Sherman Act, the Clayton Act, the Federal Trade Commission Act, and the Robinson-Patman Anti-discrimination Act until Jan. 1, 1948 and provided that, after that date, those laws were to be applicable to the business of insurance to the extent that such business is not regulated by state law. Similar requirements for state action, if Federal action is to be withheld, have appeared in other proposals before the Congress, notably with respect to proposals for Federal legislation on pollution abatement and forest regulation. It seems possible that this device requiring state action as an alternative to potential Federal action may become a familiar one in the pattern of national-state cooperation in the American Federal system.

The forthcoming year should prove important to the determination of the degree to which the states obviate the need for the application of Federal laws in the field of insurance, since 1947 is a state legislative year, and few state legislatures meet in 1948. The National Association of State Insurance Commissions after months of study and investigation of existing state laws have prepared a group of model rate regulatory bills. The Council of State Governments committee on insurance has recommended that the states examine their existing laws, and in those states where inadequate or insufficient regulation of rates obtain, these model regulatory bills be considered for adoption.

PUBLIC WORKS

During the war years, in accordance with the recommendations of the Council of State Governments, the states through state agencies, designated for the purpose explored their public work needs and developed extensive public work programs which they planned to put into effect at the end of the war. Because of the scarcity of construction materials, together with the greatly increased cost of proposed public works and because the expected unemployment crisis failed to develop, many of the states have postponed the construction of public work projects except where the need is immediate and urgent. It will be remembered that Congress had authorized $500,000,000 for highways through grants-in-aid in each of the first three post-war fiscal years. In spite of handicaps, the states had made excellent progress in preparing plans for major projects to be financed with these funds. Plans were completed for highways to cost $624,000,000, and work was under way on plans for projects to cost $2,500,000,000. In view of conditions, actual construction and highways contracted for fell far short of the progress that had been contemplated when Congress authorized the increased amounts involved. On the other hand, the Federal Works Agency reported that "state and local plans for public works construction so far completed have failed to reach a volume sufficient to help stabilize the construction industry for even one year in the event of an unemployment emergency." Congress has made no provision for continuing assistance to state and local plan preparation groups after June 30, 1947.

VETERANS

With respect to veteran affairs, the Council reports that state programs have been developed through legislative and administrative action and that every state has in operation an agency concerned with veterans' affairs. However, the Board of Managers of the Council of State Governments, meeting in December 1946, criticized the waste of public funds through the overlapping of responsibilities in the administration of veterans' services by state and Federal bureaus.

FLOOD CONTROL AND KINDRED MATTERS

It will be remembered that state pressure in Congress secured amendments to the 1944 Federal Flood Control Act and the 1945 Federal Rivers and Harbors Act designed to secure recognition of state interests. The cooperative Federal-state policy established under these laws provides that Federal investigations or reports for navigation, flood control, irrigation, and related purposes "shall be conducted in such a manner as to give to the affected state or states, during the course of the investigations, information developed by the investigations and also opportunity for consultation regarding plans and proposals, and . . . opportunity to cooperate in the investigations. The relations . . . with any state . . . shall be with the Governor of the state or such official or agency of the state as the Governor may designate."

To secure coordination among the various Federal agencies dealing with water resources problems, an inter-agency committee was established in the National Government. During the year, the Water Resources Committee of the Council of State Governments explored the desirability and possibility of formalizing the central inter-agency committee in Washington and devising ways and means for a closer coordination between such a committee and the states. Increasingly, Federal-state agencies to review plans and programs and to coordinate the activities of existing Federal and state agencies are being promoted in various water regions. Federal-state inter-agency committees have been established in the Missouri and Columbia river basins, and others are contemplated. Illustrating the increasing tempo of state activities as regards water resources a series of regional conferences was held during 1946 in the various interstate drainage areas, including conferences with respect to New England, the Colorado and Columbia basins, the Delaware, Potomac, and New York harbor areas, the Savannah River, the Missouri River, and the coordination of the activities of Illinois and Indiana in controlling and developing their interstate water resources. A number of conferences have been held on the controversial problems of the Missouri River, including all the intergovernmental agencies concerned, the Missouri River States Committee comprised of the Governors of the basin states, the Missouri River Inter-Agency Committee, which is composed of representatives of the various Federal agencies, and four of the Governors selected by the States Committee and the Council of State Governments. As a result of these conferences, the Council was requested to work with Iowa, Nebraska, Kansas, and Missouri in devising a suggested plan to facilitate construction of flood control projects on the lower Missouri River and accordingly has developed a suggested legislative program which will be submitted to the legislatures of these states at their forthcoming regular sessions.

TAXATION OF AIRLINES

In 1947, the states will endeavor, by joint state legislative action, to clear up the question of multiple taxation in the field of air carriers. In the Northwest Airlines case, the Supreme Court's decision had the effect of permitting such multiple taxation of airlines. However, in that decision the Court clearly indicated that Congress has the power by means of legislation to prevent multiple or unduly burdensome taxation of interstate air commerce. Federal legislation was promptly introduced to achieve this end by setting up a formula for the allocation of such taxes, but the states have taken action through the Council of State Governments to achieve the same goal through common legislative action. Under the proposed state measure each state can tax air carriers by a personal property tax, a tax on gross receipts or net income or on capital stock. But while each state may adopt the method of taxing air carriers, which it deems most appropriate in view of its existing tax structure, the allocation formula will be the same regardless of which method of taxation a state adopts. That formula is the state's portion of arrivals and departures, revenue tons handled, and originating revenue, with each of these factors receiving equal weight. Failure of the states to act in this matter will undoubtedly lead to Congressional action.

STATE INTEREST IN INTERNATIONAL ORGANIZATION

The growing pattern of international organization may well affect the position of the states in the Federal system. Under judicial interpretation of the United States Constitution, when the National Government makes a treaty with a foreign power it can enact legislation to carry out that treaty without regard to the normal constitutional division of powers between the nation and the states, and is limited only by a specific constitutional prohibition. From the practical point of view, the machinery of the state governments may be extremely helpful in aiding in the administration of such international arrangements although, under our constitutional system, the states can not be compelled to enforce Federal statutes or treaties. That the states may, therefore, be interested in projects of international organization, which affect their functions, is indicated by the proposed Great Lakes Fisheries Treaty, the opposition of the Interstate Oil Compact Commission to the proposed Anglo-American oil treaty. and the action of the Exploratory Intercoastal Conference of the three coastal groups of states in 1946 in requesting that the states should be consulted with respect to international fisheries treaties and represented on any international agency established for the regulation of fisheries in which a state or a group of states are concerned.

FINANCIAL POSITION OF THE STATES

As has been pointed out in previous issues, the position of the states in the Federal system was not weakened but probably was strengthened during the war period. The states at the close of the war were in the strongest financial position they have attained during the past half century. This was owing in some part to the wartime tax and fiscal program developed in 1941 by the Council of State Governments. This program emphasized the maintenance of tax rates to enable the states to build resources, the payment of debts, and the conservation of state surpluses for post-war needs. Almost all the states adopted such a program in whole or part. As a consequence, the total debt of the states as a group at the close of the war had been reduced more than 25 per cent, while state and local governments had accumulated over $5,000,000,000 in surplus funds. According to the Bureau of Census figures, the nationwide total of state tax collections for the fiscal year 1946 scored an all-time high and continued the steady upward trend which began in 1937.

During the past year, the Tax Committee of the Council of State Governments issued a report and recommendations on Post-war State Taxation and Finance. The report warns that there is strong possibility of a decline in revenue because of business uncertainty and post-war adjustments at a time when it will be necessary to increase the expenditures of state governments to meet the need for deferred maintenance and new construction and because of rising costs and needs generally. In many states additional state money for aid to local government is being requested, while the state legislatures in session in 1946 experienced terrific pressure on surpluses and general war and post-war fund balances. The Committee states: "The favorable picture revealed by present general and special fund balances is not complete unless these adverse factors are also considered."

The Committee recommends a state program, which includes, among other things, retention of the anti-inflationary war policies until the present inflationary pressures are eased, and the preparation of a long-range program for the financing of the state government with maintenance of high tax rates in periods of business activity and lower tax rates during periods of recession and low income. The interstate program of the committee embodies the adoption by the states of reciprocal uniform legislation for the allocation of tax bases of interstate taxpayers in the following fields: determination of domicile of taxpayers and decedents, allocation of income arising from interstate transactions or arising out of the taxpayer's state of domicile, apportionment of property of interstate firms, especially railroads and other utilities, and allocation formulas for the taxation of interstate airlines. On the Federal-state level, the committee recommends the mutual abandonment of competing fields of taxation so far as this is feasible and requests that the Federal Government adopt certain legislative measures to assist the states. These include: development of a clear and consistent policy for Federal grants to the states, elimination of rigid dollar for dollar matching, and requirements for earmarking of state funds; development of a consistent policy for payments of taxes or payments in lieu of taxes to state and local governments for certain types of Federal property located within their jurisdiction; and the modernization of Federal estate and gift taxes and extension of a substantial credit against the whole Federal estate and gift tax for similar taxes paid to the states.

FEDERAL-STATE RELATIONS

The relationship between the national government and the states has always been and will continue to be one of the major problems of American government. During 1947, the Council of State Governments will explore the possibilities of improvement in the field of Federal-state relations. It is planned to give emphasis to three phases; first, Federal grants-in-aid; second, the further development of the new machinery for Federal-state cooperation, particularly the possibility of expanding the Drafting Committee of State Officials; and, third, intergovernmental fiscal relationships.

The grant-in-aid system since its inception during the last century has steadily grown until it has become one of the principal media of Federal-state relations and now covers at least nine major services of government and involves the expenditure of billions of dollars, but it has developed in accordance with no over-all plan. Each grant-in-aid program has developed in response to public pressures but without relation to other grants-in-aid and in particular with no consideration for programs which have not been stimulated by such grants. An over-all appraisal of the grant-in-aid system is overdue. A more balanced and better integrated system of grants-in-aid would be of major consequence to the future of national state relations and to the Federal system itself.

CHANNELS OF NATIONAL-STATE COOPERATION

One of the notable accomplishments of the defense and war periods in the cooperation between the national and state governments was the establishment of a channel of communication between the two levels of government to implement cooperative action. Machinery of this character had long been needed. In 1940, the Council of State Governments established a Drafting Committee of State Officials to appraise state laws in the light of defense needs and to coordinate state legislation with Federal programs. In time, the Section on Federal-State Relations of the United States Department of Justice was established to coordinate the suggestions for state legislation of agencies of the Government and to channel these proposals to the Drafting Committee of State Officials. As a result there have been developed periodically programs of Suggested State Legislation which were recommended for state enactment by the Council of State Governments. The channel developed for an emergency seems to have become a permanent one.

The Drafting Committee has prepared a comprehensive program for the consideration of the 44 state legislatures meeting in 1947, which has been presented at a series of four regional conferences of state legislators and other public officials held throughout the country during November and December, 1946. Aviation and hospital legislation are featured. The State Channeling of Federal Airports Act would require that participation by political subdivisions of the state in the development of a national system of public airports be in accordance with state plans and state programs. All project applications to the Civil Aeronautics Administration for Federal grants of funds would be approved by state aviation agencies and Federal funds would be channeled through such state agencies.

The State Hospital Survey and Construction Act is designed to assist states in the preparation of legislation which will enable them to take full advantage of the Federal act and meet its requirements. The State School Lunch Act is submitted for states which do not now have legislation enabling them to accept Federal grants-in-aid for this purpose.

Many of the other proposals were outlined in the 1945 article, but there are three new measures which should be mentioned—the Uniform State Insecticide, Fungicide and Rodenticide Act, which seeks uniformity of state laws in the prevention of the distribution of adulterated or misbranded products of this character; the act for the Control of Pullorum Disease of Domestic Poultry to bring about uniformity of laws dealing with the control of this disease; and the act authorizing the Purchase of Obligations Issued or Guaranteed by the International Bank which permits all fiduciary investors, but notably insurance companies and banks, to invest in obligations of the International Bank for Reconstruction and Development.

Mention should be made, in connection with the development of channels between the national and state levels of government, of the arrangement between the Council of State Governments and the Congressional Library under which the Council forwards all bills introduced in state legislatures to the Library and also reports periodically on enactments.

DEVELOPMENT OF INTERSTATE COOPERATION

It seems clearly evident that the progress which is being made towards a new and more closely integrated pattern of intergovernmental relationships in the United States has received a major impetus from the existence and activities of the Council of State Governments. This machinery of interstate cooperation, as established by the parent American Legislators Association in 1935, has as its basic units the state Commissions on Interstate Cooperation, the official negotiating agencies of their respective governments in National-state and interstate relations. Generally, these bodies follow the pattern originally envisaged in that their membership includes representatives of both houses of the legislature and of the executive branch in order to secure integration within the state government in its negotiations with other governments.

Limited at first principally to the states of the Northeast, the use of such agencies spread gradually to other states, until in 1946, 46 states had established cooperation commissions. Idaho and North Dakota, the two remaining states, are cooperating with the Council through the medium of committees appointed by their governors. In recent years, the Council has tended more and more to work through the governors and the Governors' Conference, one of the older agencies for interstate cooperation. The Council also has a working arrangement with the long-established National Conference of Commissioners on Uniform State Laws, with the result that there has been a marked rise in state enactments of the recommendations of that organization. The Council also recently agreed to act as the secretariat of the new association of state budget officers.

Recently, new organizations devoted to intergovernmental cooperation have appeared. One of these is the unofficial Council on Intergovernmental Relations which is working through groups of interested citizens. This organization has sought the participation of the local, state, and Federal governments in the experiment which is now being carried on in four counties, one each in Minnesota, Indiana, Georgia, and California. Another recent contribution to organized cooperation as among the various levels of American government has been the work of the Pacific Coast Board of Intergovernmental Relations which has demonstrated its usefulness as a forum for exchange of information and ideas among the governors, mayors, Federal administrators, and other public officials of the region.

INTERSTATE WATER COMPACTS

While Congressional action with respect to interstate compacts during 1946 was limited to the approval of an interstate compact between Colorado and New Mexico with respect to the waters of Costillo Creek and authorization to Utah, Idaho, and Wyoming to negotiate and enter into a compact for the division of the waters of the Bear River and its tributaries, there were notable developments on the state level with respect to the negotiation and formulation of new compacts and the implementation of old ones. There was a strong movement in the New England area for the formulation of an interstate compact with respect to water resources in that region, while in the Colorado basin the state governments were considering a compact for the Upper Basin to supplement the well known Colorado River Compact. In essence, in the Colorado River Compact, the Colorado River Basin states agreed on a general allocation of water between the Upper Basin and the Lower Basin states. The Bureau of Reclamation has now recommended that, before any plan of comprehensive development can be effectuated, there must be an apportionment of water to the individual states of the basin. The Upper Basin states in 1946 initiated negotiation for a compact to apportion among those states the 7,500,000 acre-feet of water apportioned in perpetuity to the upper Colorado River Basin by the Colorado River Compact. There is also involved the determination of responsibility of the Upper Basin states, in accordance with the Colorado River Compact to make deliveries of water to Mexico under the recently ratified United States-Mexico water treaty. The Colorado River Compact, as ratified in 1928, recognized this international responsibility.

Virginia failed to ratify the long delayed Ohio River Basin Compact in the 1946 session of her legislature. Only ratification by Virginia is now necessary to put that long-delayed compact into effect. There are indications that Virginia will ratify in 1948, the next year in which the legislature meets.

INTERSTATE OIL COMPACT

The Interstate Oil Compact, which established the Interstate Oil Compact Commission, will come before Congress in 1947 for an extension of the life of the agreement. Seventeen oil and gas producing states, representing approximately 90 per cent of the gas and 80 per cent of the oil production of the United States, are members of the compact commission. The governors of Indiana and Tennessee have announced they will recommend to their 1947 legislatures that those states ratify the compact. There are also indications that membership is being considered by California, Wyoming, and Mississippi. Consent by Congress to the further extension of the life of this compact seems a foregone conclusion.

INTERSTATE PAROLEE COMPACT

It seems certain that Missouri will become the 40th state to ratify the Interstate Parolee Compact, which has been ratified by the largest number of states of any compact in the history of the Union. Missouri has enacted the enabling legislation and only executive action by the governor ratifying the compact is necessary to participation. The Interstate Compact for the Supervision of Parolees and Probationers was drafted and signed in September of 1937 by 25 states. Fourteen additional states have since become signatory, and only Georgia, Kentucky, Mississippi, Missouri, Nevada, North Carolina, South Carolina, South Dakota and Texas are, at present, non-participants. As was pointed out in 1945, there have been interesting developments with respect to this compact in the formation of an Interstate Compact Administrators Association to improve the operation of the compact. This Association will be headed by a council of five members which constitutes a standing committee on rules and regulations. This group is to be the clearing house for all matters that may arise under the rules and regulations and the adapted forms, and will act as the instrumentality for the interpretation of those rules. An interesting situation with respect to exchange of ratifications was cleared up by the Association when photostatic copies of all ratifications were sent to each participating state to remedy some omissions caused by states having become members at varying times over the last decade.

INTERSTATE FISHERIES

The Pacific Coast states and the Gulf Coast states will be considering during 1947 and 1948 the adoption of interstate compacts on those coasts for the establishment of interstate marine fishery commissions similar to that established by compact among the Atlantic Coast states. The proposed compact for the Gulf Coast states in its present draft includes a significant innovation in that it provides for membership by foreign states or component units of foreign federal systems in the proposed Commission if Congress gives its specific consent to such an arrangement.

Fisheries have proven one of the most fertile fields for the development of interstate organization. The developments in this field during 1946 are especially noteworthy. Under the auspices of the Atlantic States Marine Fisheries Commission and the Council of State Governments, an Exploratory Intercoastal Fisheries Conference was held in May 1946 for the discussion of common problems, particularly on the state-national-international level. For the first time, the states of all three coasts, Atlantic, Gulf, and Pacific, were drawn into a common endeavor. As a result of the conference impetus was given to the movement for interstate fisheries compacts on the Pacific and Gulf Coasts.

The states also took a common stand in requesting that the states be consulted in the negotiating stage and represented in the administrative stage with respect to international fishery treaties which affected the states. The proclamation of President Truman in 1945, directed to foreign nations, in which the United States asserted its right to establish conservation zones with respect to fisheries contiguous to American coasts but beyond the three-mile limit, was discussed particularly with respect to the problems it raised as to the relative Federal and state jurisdiction. The Conference recommended that the state governments consider a similar assertion of jurisdiction but that in so doing they refrain from discriminating against the fishing vessels of other states. In addition to these significant decisions the Conference established an Intercoastal Committee of three representatives from each coast to act as a liaison agency on these matters.

During the year, the members of the Atlantic States Marine Fisheries Commission from Virginia and Maryland recommended the amendment of the historic Potomac compact of 1785 to provide for the establishment of an interstate commission to manage and regulate the common oyster fisheries of that river. Delaware and New Jersey similarly are seeking to improve the operation of the old Delaware Bay fisheries compact between those two states.

President Truman on April 22, 1946 transmitted the long awaited Great Lakes Fisheries Treaty to the United States Senate. The treaty is notable in that it was initiated originally by the Great Lakes states and because the governments of those states were consulted during its negotiation. The treaty establishes the International Commission for the Great Lakes Fisheries with three American and three Canadian members and authorizes this body to regulate the fisheries of the lakes. The treaty breaks new ground in that one of the Canadian members will represent the Province of Ontario and one of the American members will represent the Great Lakes states and will be appointed by the President from a "list of two or more persons named by the states having jurisdiction on the Great Lakes." Licensing and administration on the American side will be carried on, in the first instance, by the states and on the Canadian side by the Province of Ontario. This is a new departure in treaties in American treaty annals.

STATE CONSTITUTIONS, INITIATIVES, AND REFERENDA

By Edwin O. Stene
Associate Professor, University of Kansas

GENERAL

The electorates of 36 states exercised their powers of direct democracy in 1946 by passing on 157 questions, including 127 constitutional amendments, seven proposed bond issues, 21 legislative acts, and two official opinion polls. Louisiana, with 31 proposed amendments, led in the number of questions submitted. California ranked second with 17 questions on the ballot, while Alabama and Oregon each had nine.

State legislatures submitted 117 constitutional amendments, of which 80 were approved and 37 rejected. Of the other ten measures submitted by the legislatures, all except two were approved. Initiated petitions met with more favorable verdicts than usual. Ten constitutional amendments were proposed by petition, and nine were adopted. Six initiated bills were adopted and seven rejected. On referred bills, the petitioners were sustained in three instances, whereas two legislative acts were upheld.

GOVERNORSHIP SUCCESSION

The executive branch of government received somewhat less attention than in the wartime election years. Yet questions regarding succession to the governorship and executive salaries were voted upon in several states. Connecticut completed the adoption of an amendment, approved in several towns in 1945, whereby the lieutenant governor-elect will succeed to the governorship in case of death, resignation, or disqualification of the governor-elect. Oregon, where there is no lieutenant governor, placed the presiding officers of the senate and house of representatives ahead of the secretary of state in the line of succession, and California added three elective officers to the line of possible succession.

EXECUTIVE SALARIES

The legislature of South Dakota, after repeated and unsuccessful attempts to raise the meager salaries fixed in the constitution for executive officers, finally won authority to prescribe salaries by legislative act. Arkansas adopted a new schedule of executive salaries, and California laid the basis for executive salary increases by establishing constitutional floors instead of ceilings.

ADMINISTRATIVE BOARDS

The trend so evident in the war years, toward establishing constitutional administrative boards, appears to have subsided, at least temporarily. No new constitutional boards were created; a proposal to establish a board of education in West Virginia was rejected. The burden placed on the voters by freezing administrative bodies into the constitutional structure was indicated, however, by the fact that two amendments were necessary—and a third was unsuccessfully attempted—in order to make minor changes in the structure and powers of existing boards. In California, for example, one of the 17 questions was submitted to the electorate because the legislature wished to change the Railroad Commission to a Public Utilities Commission and make the appointment of commissioners subject to senatorial approval.

Retirement systems for state employees were authorized in Texas and Louisiana. California, again struggling under detailed constitutional regulations, authorized the appointment outside of the civil service of a deputy superintendent of public instruction and three associate superintendents. The Florida voters turned down an amendment which would have made the state budget director an appointee of the legislature, and those of Arizona rejected a proposed four-year term for executive officers

LEGISLATIVE

Legislative salaries and legislative sessions accounted for almost a score of constitutional amendments, all proposed by legislatures. By the salary amendment already mentioned, the South Dakota legislature will hereafter be permitted to fix the compensation of its members. Legislative salaries will be increased also in Alabama, Connecticut, and Idaho, but the voters of Missouri, Arizona North Carolina, and North Dakota refused to increase the pay or expense allowances of their lawmakers.

Four amendments provided for changes in legislative sessions. California established annual sessions but a similar proposal in Connecticut failed to win approval. Alabama and New Mexico adopted minor changes in provisions for legislative sessions.

Vacancies in the Kansas legislature will hereafter be filled in such manner as the legislature may provide instead of by special election, but an attempt to make a similar change in Wyoming was rejected at the polls Also rejected was an attempt to add one member to the Oregon senate.

Two states adopted amendments by which their legislative procedures will be simplified. In South Dakota the number of readings of a bill will be reduced from the traditional three to two—one on introduction and one on final passage, and hereafter the reading of a bill "by sections" in the Oregon legislature may be dispensed with in either house by a two-thirds vote.

STATE FINANCES

Almost a third of the measures submitted to the electorates were related directly to state finances. These included bond issue measures, mostly for veteran's benefits, tax exemptions or special tax rates, and the allocation of state funds for specific purposes. In addition to the veteran's benefit acts, educational funds accounted for a large proportion of the expenditure authorizations.

With the view to taking advantage of such assessments as Congress may permit, four states repealed or modified their constitutional prohibitions against the taxation of Federal properties. Other states granted limited exemptions or low rates on new manufacturing plants, air transport facilities, and forest lands. Louisiana alone adopted six tax exemption amendments, including two which excluded farm tractor fuels and bulk deliveries to Federal service forces from the constitutional one-cent motor-fuel tax. North Dakota also made provision for the refund of taxes paid on tractor fuels. California repealed its educational poll tax.

Texas adopted a constitutional amendment to require that all motor fuel tax revenues, except a portion set aside for the school fund, must be used for highway construction and maintenance purposes, and Arizona adopted an initiated bill providing for the distribution of a portion of the gasoline tax revenues to local governments for streets and roads. Michigan adopted an initiated constitutional amendment which requires that the revenue from "one cent" of the sales tax be apportioned among the local governments according to population.

Voters of North Dakota rejected a proposed constitutional tax levy for post-war rehabilitation, and those of Oregon refused to permit a special levy for the construction of armories in a score or more of cities throughout the state. The North Dakota electorate also overruled the state legislature on a referred bill which would have increased the assessed value of property from 50 per cent to 75 per cent of its "full and true value."

In rejecting five out of six constitutional amendments submitted by the legislature, Florida voters turned down a proposal that would have restricted all appropriations to two years and prohibited incidental appropriations in other legislation. Colorado refused to adopt a proposed amendment that all balances in the old age fund at the close of each fiscal year should remain in that fund for future payments and expenses.

EDUCATION

On the whole the electorates demonstrated a willingness to increase governmental expenditures for education. Here California took the lead by writing into the constitution a section which provides that state support for schools shall be increased to $100 per pupil, that local districts shall be authorized to determine the amount of money to be raised from school taxes, and that the minimum salary for teachers shall hereafter be $2,400 a year. This amendment, initiated by petition, was adopted in preference to a more moderate state-aid amendment submitted by the legislature. Oklahoma adopted an amendment to provide that the legislature shall raise and appropriate for common school support a sum equal to $42 per pupil, Oregon enacted a bill for state support at $50 per pupil, and Utah increased its state aid to schools by 50 per cent Nebraska, on the other hand, rejected a state-aid amendment. All of the state-aid measures, except the rejected alternative plan in California were proposed by popular initiative.

In addition to the state-aid plan already mentioned, Oklahoma adopted an initiated amendment to require that the legislature provide free textbooks for common schools, and two amendments raising the limits on local school tax levies. Oregon adopted a rural school reorganization bill referred by the legislature, whereas the voters in Arkansas rejected by a narrow margin an initiated reorganization bill. Wisconsin's electorate refused to permit the legislature to provide for public transportation of children to and from parochial schools.

Louisiana adopted an amendment to authorize the establishment of a statewide teacher's retirement system As already mentioned, the West Virginia legislature failed to win approval of its plan to abolish the office of elective state superintendent of public instruction, whereas the California legislature was authorized to add four non-civil service deputies to the superintendent's staff.

VETERANS BENEFITS

Veterans of the Second World War were the direct or primary beneficiaries of ten measures adopted by popular vote and the intended beneficiaries of two that were defeated. Michigan, Illinois, and Rhode Island approved bond issues for veterans' bonus payments, and Rhode Island adopted a second measure extending the same benefits to veterans of the Merchant Marine. In Maine, on the other hand, a veterans bonus amendment and a bond issue act were rejected by substantial margins. Limited property tax exemptions were granted to veterans by Arizona and Louisiana, while financial credits and other assistance in the acquisition of homes and farms were authorized by California, Texas, and New Jersey. The New Jersey bond issue was authorized in order to provide housing for veterans "and other people of the state," but undoubtedly a large part of the support was won because of the specific inclusion of veterans. A New York measure to increase the authorized subsidies for housing probably should be classified as a veteran's benefit measure also.

LABOR

The general reaction against organized labor was reflected in the popular vote on submitted questions. Arizona, Nebraska, and South Dakota adopted anti-closed-shop amendments to their constitutions, thus following the examples set by Arkansas and Florida in 1944. Massachusetts also adopted an initiated act directed against organized labor, requiring that all unions file names and salaries of officers, financial reports, and statements of their dues, fines and other assessments. California voters, by a margin of almost three to one, rejected an initiated fair employment practices bill.

LOCAL GOVERNMENT

Thirty-five measures, including the Oklahoma school tax amendments already mentioned, related directly to offices and powers of local governments. Of these acts, about half were special in character, pertaining to specifically named communities. Louisiana adopted eight of the special amendments, Alabama three, and Florida and Maryland one each. Florida and Georgia accounted for four special amendments that were rejected at the polls.

The general acts relating to counties and cities did not meet with wide popular approval. Municipal tax limits were raised in Alabama, and Arkansas counties were authorized to levy taxes to provide library services, but the latter state refused to increase the constitutional limit on county road taxes. A half dozen amendments to increase terms of local officers, to eliminate prohibitions against repeated succession in office, and to authorize increased debt limits were rejected. North Dakota voters refused to authorize optional plans of county government, and the Louisiana electorate turned down a plan to permit municipalities to appropriate moneys for aid to agriculture and industry.

SUFFRAGE AND ELECTIONS

The electoral process—the right to vote and the manner of holding elections for public officers and on public questions—was the concern of a half dozen proposed constitutional amendments. Obviously for the purpose of facilitating the disfranchisement of Negroes, Alabama added to its suffrage qualifications the requirement that a voter must be able to "understand and explain" any article of the United States Constitution. Louisiana, on the other hand, extended the suffrage to inmates of a United States Marine Hospital. Colorado authorized counties to purchase and use voting machines.

In Illinois the voters refused to change the method of amending the constitution. The proposal would have permitted the submission of three amendments at one election instead of only one, and it would have required a two-thirds vote for adoption of amendments. The present article requires approval by a majority of those voting at the election, and it was because of this requirement, and not an express negative vote, that the amendment was defeated.

The California constitution was clarified by a specific authorization to the legislature to propose and submit amendments to laws previously enacted by initiative and referendum, but at the same time the voters refused to validate amendments previously added to the initiated alien land law of 1920.

OLD AGE PENSIONS

Old age pension schemes were less prominent than they had been during the past decade. Only in Oregon was a general old age pension act proposed, and that was rejected by a wide margin. Another proposed change in the old age assistance law—concerned primarily with the structure of the administrative commission—was defeated in Massachusetts.

HEALTH AND HOSPITALS

The Alabama legislature was authorized to establish and maintain hospitals and health centers, as were also the counties in that state, and to accept Federal grants for the purpose. A South Dakota statute, requiring that all hospitals and related institutions be licensed by the state board of health, was upheld on referendum.

INTERNAL IMPROVEMENTS

Constitutional restrictions on state participation in internal improvements were modified in Michigan and Alabama to permit the construction of airport and related facilities. The Michigan amendment also added waterways and harbors and the reforestation, protection, and improvement of "land in the state." A Wyoming amendment to authorize state construction of airports failed to win the required majority of all ballots cast at the election. Three amendments designed to modify state activities for the promotion of agriculture and industry were defeated in Louisiana, and an initiated bill, which would have required the approval of voters in the area as a prerequisite to the acquisition of operating properties by a public utility district, was defeated in Washington.

LIQUOR AND BETTING

Regulation of liquor and gambling had a minor place among the questions before the electorates. North Dakota enacted an initiated bill to prohibit the sale of liquor in places where other commodities are sold, except tobacco products and soft drinks, while Idaho rejected a measure to provide county option and to limit the amount of liquor that one might legally possess. California voters rejected an initiated bill to authorize and regulate pari-mutuel betting at greyhound races.

INTERNATIONAL POLICY

Though it had no legal force, the vote on a question placed on local ballots in Massachusetts was highly significant. By overwhelming margins the voters approved a proposal to instruct delegates to the State's General Assembly to ask the United States authorities to propose and support amendments to the U. N. Charter in order to strengthen the United Nations and "make it a World Federal Government able to prevent War."

MISCELLANEOUS

Oregon repealed a constitutional provision which prohibited Chinese from holding or working mining claims. In the same state a referred bill to restrict and regulate the fishing of salmon in coastal and inland streams was upheld. Louisiana authorized district courts to try cases involving violations of fish and game laws occurring on the coastal waters of the state, but two proposed amendments, which would have extended jurisdiction in fish and game cases to the justice of peace courts, were rejected.

Women were made eligible for jury service in North Carolina, and on an advisory vote Massachusetts approved the enactment of legislation to require women to serve on juries. Maryland and Louisiana adopted minor changes in the constitutional provisions relating to the courts, while California voters refused to approve the establishment of a court of tax appeals.

ELECTORAL LEGISLATION

By O. Douglas Weeks
Professor, The University of Texas

GENERAL

Only 12 of the 24 states which held legislative sessions during 1946 enacted electoral legislation, and in only half of these were the changes voluminous or important. The most extensive and significant amendments to election laws were made in Massachusetts, New York, and Virginia, in which special commissions (in New York, a joint legislative committee) have been at work studying the election statutes and proposing revisions.

NOMINATIONS

Kentucky extended the time for filing nomination papers, certifying candidates, and the drawing by lot for places on the primary ballot. The dates for holding primaries in second and fourth class cities were moved from the third to the seventh Saturday before the general election. The primary was dispensed with in certain city elections when no more than two candidates announce for elective offices. Louisiana legislated with respect to the dates of holding primary elections, their conduct, and making returns thereof. In Massachusetts the primary date for 1946 was moved from the seventh Tuesday before election to the 18th of June; a change of date was also made for holding special primaries to fill vacancies in the State House of Representatives.

The date for holding the 1946 primary election in Michigan was shifted from September to June (third Monday), and state central committees were required to canvass the proceedings of conventions not less than 115 days prior to the November, 1946 election; the proof copies of the official general election ballot were required to be filed at least 97 days prior thereto and absentee ballots to be delivered to the county clerks 92 days before the election. New Jersey moved the primary date from the second to the first Tuesday in June, to which date the primary formerly held on the third Tuesday in May in presidential years was also moved. Earlier dates were set for caucus meetings and for filing nominations for general elections in Rhode Island. Virginia now requires 65 days notice of primary candidacies by publication, posting, or both; also party committees must furnish the State Board of Elections with the names of candidates who have filed in primary elections.

In Missouri the X mark was substituted for scratching as the method of marking primary ballots. New York made minor changes as to nomination petitions, posting lists of nominations, and the number of ballots to be provided in primary elections, enacted amendments affecting removals of party committee members and the filing of party committees, and made temporary alterations in regard to state and county committees for 1946.

CONDUCT OF ELECTIONS

Virginia created a bipartisan State Board of Elections consisting of three members to be appointed by the Governor and General Assembly, which succeeds to the powers and duties of the Secretary of the Commonwealth and the Board of State Canvassers imposed by the election laws. The functions of the new board include supervision of the work of local electoral boards and registrars, the purging of registration, enforcement of election laws, and the preparation and distribution of records. The board is to have a secretary with an annual salary of $5,000, and board members are to receive a per diem of $20. Virginia also revised provisions affecting polling hours, filing for general elections, preservation of unused and defaced ballots, extension of assistance to disabled voters, jurisdiction in contested election cases, compensation of electoral boards, death or withdrawal of candidates, alteration of voting districts, and the provision of facilities for polling places.

New York altered the conduct of elections in many details with respect to making returns, submitting constitutional amendments, polling equipment, voters' registers, vacant candidacies and offices, election officials, ballot paper, voting machine procedure, challenge affidavit form, canvassing boards, etc. Kentucky extended the time for filing candidacies for municipal elections and for the certification of constitutional amendments, changed provisions covering contested elections, recounts, and voting machine procedure, and provided for state payment of one-half the cost of holding an election in each county up to $20 for each precinct, in addition to any sum paid by the state for ballot papers.

Louisiana legislated with respect to the pay of election commissioners and the qualification fees of independent candidates. Massachusetts altered town ballots to include street addresses of candidates and amended the requirements as to sealing ballot boxes. Owing to the abolition of the office of justice of the peace in Missouri, new bipartisan groups were created in each county, appointed by the county court, to count absentee ballots and canvass election returns, and jurisdiction in contested election cases was vested in other courts. Contests involving the office of governor were transferred from the Missouri General Assembly to the Supreme Court.

Nebraska allowed candidates for an office with surnames the same in spelling or sound to have their addresses and occupations placed on the general election ballot. New Jersey provided for mailing out sample ballots and clarified voting machine provisions. Rhode Island adopted daylight-saving time for polling. An attempt failed in Maine to change the general election date from September to November. South Carolina and Vermont enacted minor local legislation involving elections. Connecticut approved a constitutional amendment to permit the succession of the lieutenant-governor-elect to the governorship in the event of the governor-elect's death or his failure to qualify.

REGISTRATION

Per diems and ten-day continuous sessions were provided in Kentucky for county boards of registration and purgation both before the primary and general election; failure to vote for two years outside first class cities no longer will remove a voter's name from the registration roll. Massachusetts enacted additional absent registration provisions for the physically disabled and provided for continuous registration in towns having 600 or more voters. Michigan extended the system of registration formerly restricted to townships and cities of 5,000 or above to all townships, cities, and villages. New registration provisions for voters who change their residence and for veterans were added in New Jersey. New York altered provisions with respect to the literacy requirement for war ballot voters, voters' registers, registration reports, central registration procedure, registration of voters deriving citizenship through naturalized citizens, and registration of persons absent on military duty. Rhode Island and Virginia amended their registration procedure as to certain details.

ABSENT VOTING

Kentucky legislated to apply absent voting to all elections and primaries both inside and beyond the United States and enacted special provisions for the registration of voters in the armed forces. Soldier voting for the election of 1946 was facilitated in various ways in Massachusetts. Michigan extended her soldier voting law of 1944 to cover 1946 with minor changes. New York reenacted her 1945 law providing for a temporary state war ballot commission and to facilitate voting in the armed forces to apply to the general election of 1946 with some changes as to procedures, dates of holding conventions and primaries, the certification of candidates and the filing of local option petitions. Some alterations were also made in the New York absent voting law for civilians, and a constitutional amendment was initiated to extend absent voting to elections other than general elections. A constitutional amendment was proposed in Rhode Island to extend absent voting on account of old age, physical disability, illness, and other physical infirmities. Slight changes were made in the absent voting law of Virginia.

CORRUPT PRACTICES

Massachusetts revised her corrupt practices statutes. Provisions defining corrupt practices, election inquests, and violations of election laws were amended with a view to effecting a more logical arrangement of subject matter, such as placing the penalty for each violation in the same section with the offense. Fines as alternatives to imprisonment for certain offenses were provided. Most important was the liberal increase in maxima for campaign expenditures for all elective offices. Allowances for U. S. Senator and Governor were increased from $5,000 in the primary and $10,000 in the general election to $20,000 for each election; allowances for other offices were doubled in most cases.

Authorized campaign expenditures for state senators in both primaries and general elections were increased in Kentucky from $500 to $1,000 and for state representatives from $350 to $750. Kentucky forbade any candidate in a primary or general election to agree not to file a contest or to agree to withdraw in return for any payment or other valuable consideration. Louisiana altered the penalty for fraudulent voting. New York forbade political advertising within 100 feet of polling places, established a penalty for issuing a fraudulent certificate of literacy, and set up a new provision as to false statements or affidavits of witnesses to petitions. New Jersey clarified her law with respect to the receipt of contributions by party committees. Virginia changed intimidation of election officials from a misdemeanor to a felony, placed existing corrupt practices statutes under the election laws, and forbade the making of a copy of the ballot at the voting booth.

COUNTY GOVERNMENT

By Mary Capen Davis
New Jersey College for Women, Rutgers University

GENERAL

Legislative activity in the field of county government was relatively slight during 1946 as most state legislatures did not meet in regular session. Nevertheless, this does not mean that the problems of county government have been neglected. The whole position of counties, as local governmental units and their ability to perform the services demanded of them, have been made subjects of considerable study. The general direction of such legislation as was enacted, dealing with county functions, was toward greater flexibility of operation. One result of a national emergency is increased emphasis on effective performance on all governmental levels. In the counties, this is manifested by continuing efforts to reorganize and streamline the machinery of government and by a tendency toward cooperation among all types of local units.

IMPLEMENTATION OF CONSTITUTIONAL CHANGES

Georgia and Missouri adopted new constitutions in 1945, both of which provided for changes in the county pattern. Legislatures in these states have now begun the task of translating constitutional recommendations into legislation. The principal items in the Georgia constitution relating to counties pertained to education, finance, and consolidation of counties. In the first category, an enabling act, describing the purposes for which counties may levy taxes, was passed. In the second, is another enabling act authorizing the transfer to county boards of education of all the powers of existing local district trustees of schools. The act provides further that each county shall be one school district under control of a county Board of Education and enumerates the general and financial functions of new districts. This legislation clarifies and implements the new constitutional provision regarding education.

In Missouri, a special Revision Committee on Local Government was established by the House of Representatives to draft legislation needed to effectuate constitutional changes. The major work of the legislature regarding county government was to establish four classes of counties on the basis of assessed value and to establish three alternative forms of government for the fourth class within which are most of the smaller, poorer counties where simpler and less expensive government has long been needed. Each alternative form of government thus provided would result in a reduction in the number of county officers and a clarification of responsibility. In addition, the legislature passed nearly 100 bills making important changes to fit existing laws to all counties in a class. (Cf. for detailed discussion of the Missouri reforms: Sparlin, E. — "Missouri Counties Streamlined," *National Municipal Review,* July, 1946.)

COUNTY MANAGER

Two counties, which have for some time been interested in the county manager form of government, moved closer toward achieving it in 1946. Fulton County, Georgia voted in favor of a county manager form in June. The Fulton County Board of Commissioners authorized the appointment of a committee to draft a manager bill for introduction in the next legislature. Montgomery County, Maryland voted Nov. 5 for a commission to draft a county manager charter. The first attempt to get such a charter had been defeated in 1944.

EXTENSION OF COUNTY FUNCTIONS

The development of new county functions, with an accompanying organizational growth, continues. For example, Virginia authorized the counties of Warwick, Elizabeth City, and York, together with the cities of Newport News and Hampton and the town of Phoebe or any two or more of them, to establish a commission for the construction and operation of airports. The commission is empowered to exercise the right of eminent domain. These same counties and cities are also authorized to set up the Grandview State Park Commission to establish and operate a state park until it is taken over by the Virginia Conservation Commission.

In New York, under a law that became operative April 1, 1946, counties may elect to become special districts for welfare purposes. Rochester voted to transfer all welfare functions to Monroe County in accordance with this act. New Jersey gave its counties and municipalities the power to create sewage authorities with the right of each to issue its own bonds. California counties were given permission to establish inspection services for the licensing of agencies for the care of children and of the aged. These services must be accredited and approved by the State Department of Social Welfare. Their costs are to be borne by the state.

COUNTY-CITY RELATIONS

Evidence of increased cooperation between counties and cities is to be observed in a few states. California authorized its counties to assist any city in the acquisition of property to build and maintain an airport. Such assistance may take the form of money, material, services, or property. Also in California, Santa Barbara County established a water agency to negotiate for water districts and cities inside its limits with the United States Bureau of Reclamation. The agency is to cooperate in providing adequate water supply for the cities. One of the acts of the Missouri legislature, in its county reform program, was to permit counties to contract with cities or other counties for a common service. Louisiana voters adopted an amendment passed by the 1946 legislature providing for creation of a city-parish (county) charter commission to work out a consolidation or reorganization of the local units within the parish of East Baton Rouge.

VETERANS' AID

As this article pointed out in 1945, the principal agent in the development of veterans' aid programs has been the state rather than the county. However, there has been some county action in this field. Wisconsin counties, cities, towns, or villages were allowed to appropriate money or grant the use of land or buildings to provide houses for veterans or servicemen. California appropriated $7,500,000 for any local agency of the state to use in supplementing Federal funds for veterans' emergency housing. The State Director of Finance is to have control over the conditions under which the money is granted and to have supervision of the management and operation of any local housing facilities built. New Jersey authorized its counties to establish apprentice and on-the-job training programs for veterans in public service positions. In New York, counties were empowered to lease or lend any real property to the United States for any function related to the war effort or the hospitalization, rehabilitation, and welfare of war veterans.

STATE AID TO COUNTIES

Some instances of state aid are to be found in the small legislative record for 1946. New Jersey and Missouri provided aid to counties for construction and maintenance of roads. California appropriated $45,000,000 to be allocated to counties as help in the construction of public works to prevent or alleviate unemployment. In Ohio, county homes for the aged will now receive state support to supplement the often inadequate county funds. Virginia, which for some years has been developing a state advisory service to counties on real estate assessment problems, appropriated $20,000 for carrying on its assistance program. It also made mandatory the reassessment of real estate in all counties within the next four years. The significant feature of this program is its voluntary character. Counties may avail themselves of professional advice and personnel supplied by the state but they are under no compulsion to do so.

STUDIES OF COUNTY PROBLEMS

The interim between regular legislative sessions has been utilized in a number of states for the study of various aspects of county operation with a view to making recommendations to the 1947 legislatures. Some of these studies have been focussed on specific problems of county government. Others have been directed to a survey of the place of the county as a local governmental agency and to possible ways of increasing its effectiveness. The Connecticut Legislative Council, which was directed by the 1945 General Assembly to study the relationship of state and county with respect to public wards, issued a report of its findings. It recommends elimination of the existing division of guardianship between state and county and the placing of all children under the care of the state where trained social workers would have continuous supervision over them. The county homes would then be used as reception centers before placing the children in foster homes rather than as permanent residences. This reallocation of functions would simplify the administration of the care of neglected children and improve the quality of that care.

In Tennessee, the Board of Trustees of Knoxville issued a study, "Knoxville-Knox County Relationships in the Field of Library Service." This report, prepared by the planning commissions of Knoxville and Knox County, deals with the question of providing adequate library service for both city and county. It favors assumption by the county of full responsibility for library service in both the urban and the rural area, with the city supplementing the county service if necessary. If such a solution were adopted it would result in simpler administration, more adequate financing, and more equal service for county and city residents. The governor of Oregon has appointed a committee to study rural and suburban zoning and to draft legislation to be presented to the 1947 legislature. In New Jersey, a Senate Joint Resolution created a legislative commission "to study salaries fixed by statute of State and county officers, and ascertain existing inequalities from the standpoint of duties and county populations . . ."

Four states have undertaken examinations of the general status of county government. A New York Temporary State Commission, created in 1944 to "study, codify, revise and make uniform . . . existing laws relating to counties . . ." was continued until Feb. 15, 1947. The Massachusetts legislature established a commission to consider the advisability of abolishing the county as a unit of government and transferring its functions to appropriate departments of the commonwealth. Since counties in the New England states operate more as agencies of the state than as representatives of a local community, the question of their abolition is almost entirely one of administrative convenience.

In Michigan, the Institute of Local Government, an organization of county officials, is sponsoring a proposed constitutional amendment which would increase the home rule powers of counties. A county chief executive would be optional under the charter plan provided by this amendment. After defeat in 1945 of a constitutional amendment designed to reform county government in the state, the Wisconsin legislature established a Joint Legislative Interim Committee to study the general problem. It spent the year investigating possible solutions to the county government tangle. The avenue of constitutional reform having been blocked on several occasions, the committee seems to be leaning toward a plan of extensive statutory changes within the existing constitutional framework.

Results of these various studies should be visible in 1947, which gives every indication of being a year of fruitful activity within the area of county government.

Professor, New York University

INCEPTION OF THE NEW ADMINISTRATION

The year 1946 may be regarded as particularly important in that it marked the first full year of peacetime operations while simultaneously the Democratic Party took over control at City Hall after 12 years of Fusion administration under Fiorello La Guardia. During the preceding mayoralty campaign great emphasis was placed on the fact that the Democratic candidate and successful contender, William J. O'Dwyer, was not a typical organization man, and that his candidacy had been accepted with some reluctance by the leaders of the Democratic organization within the city. Many voters were persuaded to vote for General O'Dwyer by reason of his campaign pledges of efficient and nonpartisan municipal government. Some indication of the independence which might be expected from the new administration was shortly found in the retention of several key men of the La Guardia regime, notably Police Commissioner Wallender, Purchase Commissioner Pleydell, and Park Commissioner Robert Moses, the latter being also designated as Coordinator of the entire municipal public works program. This last appointment particularly seemed to indicate that the usual "machine" favoritism of insiders in the contracting field would not be permitted.

MAYOR O'DWYER AND HIS PROBLEMS

On the negative side, observers could point to the fact that the new Mayor would be dependent, in many respects, on the support of a majority of the Board of Estimate. Three of his associates on that body, the Borough Presidents of Brooklyn, Queens, and the Bronx, had long been associated with organization politics, as was true also of the new Comptroller, Lazarus Joseph, and Council President Impelliteri. In addition, the Democratic majority in the City Council is composed almost entirely of organization men. At the end of his first year in office, although many of his actions had met with criticism, it was generally conceded that the Mayor had measured up reasonably well to his campaign promises.

Mayor O'Dwyer took over the city at a time when many of its services had been undermanned and consequently ill-maintained during the four years of the war. Chief among his problems was the rehabilitation of the subway system. It was estimated that at least $200,000,000 would be required within a period of three or four years to provide the city with adequate transportation. Sizeable sums would be required for emergency housing, erection of new schools, and recruitment of the Police and Fire Departments to pre-war strength. With rising prices, a demand by municipal employees generally for wage increases would be inevitable. Yet like all cities in the country, New York is definitely limited in its power to tax or borrow.

The first two months of his administration were especially trying for

Mayor O'Dwyer. Before he had had time to become reasonably well acquainted with his new duties he was threatened with a transit strike by the Transport Workers' Union. Shortly thereafter it became apparent that the city was faced with a prospective deficit of over $100,000,000 during the next fiscal year. A third major problem was caused by a strike of tugboat employees, threatening the city with a disastrous fuel shortage. Finally, toward the end of February, 1946, the transit workers threatened another strike. In each case Mayor O'Dwyer managed to resolve the difficulties confronting him, but not without severe criticism from many quarters.

FINANCIAL PROBLEMS

As indicated above, one of the most serious problems confronting the new administration was that of municipal finance. Upon taking office, the Mayor made a careful survey of the city's fiscal situation and announced that a deficit of approximately $120,000,000 was in prospect for the ensuing fiscal year. This resulted from increased expenditures to meet the postwar situation and the definite limits placed by the State Constitution on the city's borrowing and taxing power. In addition to the basic tax on real estate, the previous administration had obtained legislative permission to levy certain special taxes, notably the impost on sales. These, however, were not deemed sufficient. Within three years, it was estimated that the city's normal public works program, including subway improvements, airport and market facilities, streets, etc., would run close to $1,400,000,000, to say nothing of $1,500,000,000 additional for a redevelopment program for blighted areas, as drawn by the Citizens' Housing Council and approved in principle by Mayor O'Dwyer and his associates. Accordingly, in a letter to the State Comptroller, the Mayor requested legislation to increase the city sales tax from one to two per cent, the entire amount to be earmarked for subway improvement; the creation of a City Airport Authority and Market Authority to finance completion of Idlewild Airport and the proposed lower Manhattan produce center outside the city debt limit; and the allocation to the city of a larger share of state tax revenues.

These proposals aroused tremendous controversy, particularly that regarding the increase in the sales tax. This tax had originally been inaugurated to provide funds for relief during the depression and had been continued for general purposes after that emergency subsided. In 1941, Mayor La Guardia had obtained a cut in the tax from two to one per cent. Many opponents had basic objections to any sales tax whatever; others preferred to double the subway fare; while a third group wished to reserve all such revenues for the redevelopment of blighted areas.

These fiscal proposals met with a mixed reception at Albany. The Democratic minority in the legislature naturally favored the Mayor's program, but the majority was reluctant to go the whole way. There was little opposition to authorizing an increase in the sales tax and certain other levies of previous years, but the proposal for a larger share of state collected taxes met with defeat. The Governor and his supporters in the legislature emphasized that the new formula for state grants to municipalities had already increased the city's quota and refused to accept the proposition that the metropolis' share of state aid should be directly proportionate to its contribution to the state treasury. Bills were approved, however, authorizing the creation of the proposed Airport and Market Authorities. As in previous years, another bill to authorize the operation of the city subway system by a Transit Authority failed of passage.

BATTLE OF THE BUDGET

Having been unable to obtain as much financial assistance from the state as he had deemed necessary, the Mayor was forced to modify his budget accordingly. As originally presented to the Board of Estimate, it called for a total expenditure of $857,131,849, an increase over the previous year of $93,500,000. The new or increased taxes voted by the legislature were expected to bring in some $67,000,000, and the increase in state aid $16,000,000. The remainder of the increase would have to be taken care of by a rise of five points in the basic tax rate. The new rate of 2.72 would still be 17 points below the record tax of 1943-44.

The extent of the rehabilitation required at the start of the post-war period was revealed by the fact that the increased costs for plant repair and equipment were higher than the increase provided for personal services, and this despite the provision for nearly 6,000 new jobs, including 3,000 new police. The increase in living costs since the end of hostilities was given recognition by the grant of $15,000,000 for salary increases and cost of living bonuses to more than 100,000 employees, the amounts ranging from $120 to $240, and going largely to the lower salary groups.

As in the past, the hearing before the Board of Estimate revealed the fact, usual in democracies, that the budget proposals satisfied no one. The Citizens' Budget Commission assailed the total as fantastically high, and those groups which had been pressing for an increase in the subway fare moved again to the attack. On the other side, employee spokesmen and union representatives assailed the pay increases as completely inadequate, the demands ranging from the $2 per day increase sought by the Transit Workers Union to an additional and permanent $340 over and above the proposed temporary bonuses. So emphatic were the objections raised from the employees' standpoint that the Mayor, after special conferences with A.F. of L., C.I.O. and other labor spokesmen, agreed to an upward revision of salaries, beyond the provisions originally made, amounting to between $10,000,000 and $15,000,000. It was felt that an increase in the sales and pari-mutuel tax collections over the amount originally estimated would provide the necessary funds without any further rise in the tax rate.

This decision on the part of the Mayor met with the approval of the Board of Estimate, and the budget as finally adopted by that body reached a total of $865,212,820, marking an increase over the previous year of $101,595,553. It is interesting to note that this marks the second successive year that the hearings before the Board of Estimate have resulted in substantial budget changes. For many years, such hearings, though provided in the Charter for the purpose of providing a modicum of popular control over expenditures, have been mere formalities, the Mayor in many cases not even bothering to make an appearance. In 1945, Comptroller McGoldrick broke with the Mayor and took the lead in responding to public pressure, and, in 1946, it was the Mayor who moved to inaugurate the desired changes.

While the current operating budget was being discussed and adopted, the precarious nature of the city's fiscal position was highlighted by a special report to the Mayor from Robert Moses, acting in his capacity as Coordinator of City Construction. The report, requested by the Mayor for his guidance in mapping out the capital program for his four-year term, pointed out that it would be necessary to defer some 400 public works projects, costing close to $1,000,000,000, for at least four years or longer unless some drastic change in the entire financial picture could be made. Moses was of the opinion that no such change could be expected unless the subway system was placed on a self-supporting basis, thus taking $425,000,000 of subway debt out of the constitutional debt limit. In the absence of such change, the report recommended rescission of allocations already made in the current capital budget for some 180 projects, affecting virtually every department of the city government. This report served to add fuel to the demand for the end of the five-cent fare, which continued to grow throughout the year. While no action was taken prior to the November election, it seemed likely that the administration would be forced to take some action in recognition of the problem so posed by the Moses report. Nevertheless, the subway fare increase was rejected by the Board of Estimate Feb. 12, 1947 after a two-day public hearing at City Hall in which proponents and opponents were given a full opportunity to present their views.

THE TRANSIT CRISIS

In company with many other city executives, Mayor O'Dwyer found it necessary to devote a vast amount of time to those particular problems of the post-war period which intensified the tension between management and organized labor. Hardly had he taken office when a crisis was created by the Transit Workers Union and its leader, Councilman Quill. In an attempt to avoid the necessary expenditures for refurbishing the municipal power stations which supplied much of the energy required by the subway system, the head of the Board of Transportation, General Gross, recommended their sale to the Consolidated Edison Co., and the purchase of all necessary power from that concern. Thereupon Quill threatened to call a strike of the workers if the Board were permitted to carry out this proposal. Not fully acclimated to his new duties, the Mayor was in no position to meet such an attack. Accordingly, he resolved the difficulty by agreeing to permit no such transfer in the absence of a favorable vote in a city-wide referendum. The incident provoked considerable censure of Quill, and demands were made on the City Council to oust him from his seat in that body. Taxpayers' suits were also started designed to declare his seat vacant on the ground that he had violated the City Charter provision forbidding any member of the Council from receiving remuneration for services with any concern doing business with the city. There is considerable doubt as to whether the Charter, designed to eliminate patronage in city contracts, would also apply to a representative of a union of city employees. At all events, at the close of the year Quill was still a member of the Council.

The position of the union regarding the power plants was only a minor one. More serious was the demand for sizable pay increases and for the recognition of the T.W.U. as the sole bargaining agent for the transit workers *vis-à-vis* the Board of Transportation. This latter problem was complicated by two factors. The Board of Transportation is a semi-autonomous body over which the Mayor exercises no direct control, and its members have long been adverse to adopting the collective bargaining techniques generally employed by labor and management in private industry. This position had been solidified by former Mayor La Guardia's repeated insistence that city employees had no right to strike against the city government. On the other hand the T.W.U. is not the only organization among the transit workers, and the other unions bitterly resent its demand to be accorded the position of sole representative of all the workers.

Faced with a threat of a new transit walkout the Mayor was able to persuade Councilman Quill to postpone action pending investigation of the entire matter of a special Transit Advisory Committee to be set up immediately. Those named to this Committee by the Mayor were all prominent citizens, experienced in the mediation of labor disputes. After due deliberation during most of the summer, the Committee recommended a wage increase for the workers, retroactive to July 1, and the recognition by the Board of Transportation of such organizations as the workers might designate for bargaining purposes. Over the objections of the majority of the Board, the Mayor put through the suggested pay increase. The Citizens' Budget Commission immediately protested the use of city tax notes to cover any such retroactive award and took the matter to the courts. Aroused by this action, the T.W.U. threatened once more to shut down the subways. Before the deadline set, however, the courts upheld the city's action regarding the retroactive pay, and after further conferences with the Mayor and C.I.O. President Murray, Quill agreed to leave in abeyance the matter of his union's position as sole bargaining agent. The issue, however, will very probably arise again in 1947.

THE MARITIME STRIKE

Hardly had the first transit crisis in January been resolved than a new problem confronted the Mayor. On Feb. 1, 1946, the waterfront was tied up by a strike of tugboat workers, resulting in a rapidly increasing fuel and coal shortage. The situation became so serious, as all attempts to settle the strike failed, that on the evening of Feb. 11 the Mayor put into effect an emergency rule more drastic than any experienced by the city since the Civil War. Stores, offices, factories, theatres, and schools were closed. Eighteen hours later, the emergency decree was as suddenly lifted. Faced with bitter criticism by the Board of Trade on the ground of losses to business running into millions of dollars, the Mayor stated that he had been informed at the time that there was barely enough fuel oil available to last the city another six hours, but that during the period of the emergency decree the Office of Defense Transportation, using government and railroad tugs, had brought an additional 4,000,000 gallons and had guaranteed to maintain that delivery while the crisis lasted. The Mayor indicated that he had relied primarily on the prognosis of Health Commissioner Stebbins, a hold-over from the La Guardia regime. That official, feeling himself the scapegoat, promptly resigned. The incident clearly indicated how the nature of our present economic system can make a mockery of municipal home rule.

This dependence of the city on factors outside its control was again strikingly illustrated by the brief and abortive railroad strike in May, and again in September when difficulties along the waterfront and in the trucking industry brought heavy losses to New York business men, and placed further burdens on the city's government.

In the maritime strike particularly there was little that the city could do, save to utilize the police force to preserve order. The basis for the maritime strike was the intense rivalry between CIO and AFL seamen's unions. The CIO unions first won a wage increase from the ship owners. Then the AFL unions managed to obtain a better settlement. This, the War Stabilization Board refused to accept, whereupon these unions walked out in protest. When the W.S.B. yielded to them, the various CIO unions then struck to obtain the same wage scale. Eventually the National Government was able to bring about a settlement, but in the meantime the port of New York, in common with other coast cities, had suffered tremendous losses, with its government largely helpless to intervene.

THE TRUCKING STRIKE

In the trucking strike, however, the Mayor shouldered a more immediate burden. Here, 18,000 truckers, belonging to the three most powerful AFL unions, struck for higher wages and better working conditions. None of the other 24 locals went out, but the pickets of Local 807, the biggest union, were able to persuade many non-striking drivers to stop deliveries. In addition, some 10,000 drivers in New Jersey engaged in sympathy walkouts. Beginning with the original notice by the teamsters of their demands, which was made in June, the Mayor had endeavored to mediate their differences and find a formula satisfactory to both sides. He obtained a tentative acceptance from the drivers, but the employers flatly refused to go along. With the contract expiration on Aug. 31, the strike was on. The Mayor promptly appointed 2,000 emergency police to meet any violence that might ensue. He then called on Tobin, President of the International, to direct Local 807 to negotiate. This, Tobin refused to do, but by his directive the sympathy strikes by those not directly involved, were prevented. He then managed to persuade both sides to reopen negotiations. Eventually his persistence and the aid of Federal and state mediation experts brought about a settlement.

CREATION OF SPECIAL RELATIONS DIVISION

The prevalence of labor disputes with their consequent disruption of normal business activity and occasional violence between the contestants led the Mayor to set up machinery for avoiding these difficulties. Accordingly, in mid-September, he set up in the executive office a special Labor Relations Division under the direction of an experienced mediator, W. C. McGuire. The main function of the new agency is to apprehend the possibility of labor-management disputes long before they reach the crisis or strike stage, and by furthering negotiations between the parties to head off the strike before it starts. At the end of 1946, the Mayor was pleased to report that the division was functioning efficiently and had intervened successfully in 12 important disputes. The Mayor hoped to make this service to the city even more effective in the future.

AIR TRANSPORT PROBLEMS

In 1940, La Guardia Field was opened for business as the city's main air terminal. At the time it was felt that the new field would be adequate to meet the city's needs for some 15 years. To meet this contingency, blueprints were drawn and eventually work started on a new Idlewild Airport, adjacent to Jamaica Bay, to be about eight times the size of La Guardia Field. By the time the new O'Dwyer administration came into office, it had become apparent that La Guardia Field was rapidly approaching the saturation point. In addition, part of the field was gradually sinking into Flushing Bay, thus necessitating considerable reconstruction. Some $30,000,000 had been spent on Idlewild with another $40,000,000 committed, but numerous jurisdictional strikes and mounting construction costs made its completion a serious problem.

To meet some of the fiscal problems involved, Commissioner Moses proposed the creation of an independent Airport Authority which should operate existing and future airports on a self liquidating basis, its bonded indebtedness thus being placed outside the constitutional debt limit. The Authority would not be liable to the city for any funds already spent or committed, but title would revert to the municipality when all bonds had been liquidated. Although the subject of heated controversy, the proposal was embodied in legislation at Albany, and the Mayor appointed as members of the new agency Harry F. Guggenheim as chairman, Lieut. Gen. James E. Doolittle, and Laurence Rockefeller. Immediately the Authority ran into new difficulties. Thirteen air lines already held leases on accommodations at the new field. When demand was made that these be renegotiated in view of changed conditions, they refused and took the matter into the courts. The jurisdictional disputes continued. Two members of the Authority resigned.

In view of the apparent inability of the new agency to get underway, the Mayor appointed a new committee under City Engineer John Riedel to resurvey the problem. On the basis of their report, he then asked the Authority and also the New York Port Authority, which has an interest in all transport problems throughout the metropolitan area, to submit complete plans for the future financing and management of all the city's air facilities. Both agencies submitted their propositions at the end of the year, and considerable debate was expected before any final decision should be made. In the meantime the congestion at La Guardia Field was becoming even more acute.

PLANNING AND ZONING

The year 1946 was marked by several serious setbacks in the planning and zoning activities of the city. At the end of 1944, anticipating a tremendous post-war building boom, the City Planning Commission initiated and the Board of Estimate approved a new amendment to the zoning laws, limiting height and bulk of building in retail zones. This was designed to give greater light and air to all the areas in question as well as to minimize to some extent the traffic congestion resulting from new building. The new rule met with strenuous opposition from real estate interests and from four of the five Borough Presidents. Court proceedings were instituted, and in July 1946 the Court of Appeals held that, in view of the drastic limitations imposed and the amount of opposition on record, a 10-6 vote in the Board of Estimate was not sufficient to pass the amendment. Work was begun on a new amendment, but the Commission was handicapped by the Court's failure to indicate what type of restriction would be permitted without unanimous approval of the Board of Estimate, and it was generally felt that no effective regulation of the building boom could be inaugurated.

TRAFFIC CONTROL

Another serious controversy arose regarding the Commission's action in a particular phase of traffic control. The Board of Estimate had empowered the Commission to designate "congested" areas where future building of bus terminals would be prohibited. A prime factor in the ever increasing traffic congestion in mid-Manhattan had been the horde of interstate buses using the streets to reach their scattered terminals. It was presumed that the Commission would immediately designate the entire area east of Ninth Avenue as "congested." This would open the way for the Port Authority to erect a giant terminal west of Ninth Avenue, which would eventually be utilized by all interurban lines, thus removing some 80 per cent of that traffic from the streets. Largely owing to the strong opposition of the Greyhound Lines, which planned an expansion of its terminal near Pennsylvania Station, the Commission refused to make the required designation. Accordingly the Port Authority abandoned its original construction program. As the year progressed and traffic congestion increased, the Board of Estimate divested the Commission of its authority in the matter, and it was expected that very shortly after the turn of the year it would clear the way for a resumption of the Port Authority's original terminal plans.

An attempt at a temporary solution of the traffic problem was made by designating all the cross streets between Twenty-third and Fifty-ninth as express streets and banning all parking thereon. With the additions made to the police force, it was possible to make the ban largely effective. The result was a noticeable pickup in the speed of motor traffic, together with an equally noticeable increase in the charges of the various parking lots and garages in the area. The Commission sought to meet the problem by a grandiose plan of elevated express highways across the island and a number of giant municipal parking garages, but the city's fiscal condition at present makes any realization of this program a matter of the distant future.

HOUSING

In the matter of public housing also Mayor O'Dwyer found the post-war period a time of difficulty. In common with many other cities, New York found that Federal funds for low rent projects had been exhausted, and all such building was held up pending the passage of further Federal legislation. In July, the chairman of the City Housing Authority declared there was no money in sight for seven projects in the city. Where work was in progress, the necessity for tenant relocation, jurisdictional disputes, and building material shortages all presented difficulties. In addition the sharp rise in construction costs made it impossible to finance new projects in terms of the funds allocated to them before the end of hostilities.

Some small relief was provided for veterans by the acquisition and erection on vacant property of surplus government barracks and Quonset huts. Some private housing projects, notably Stuyvesant Town, the Metropolitan Life project along the East River, were progressing, but the shortage remained acute. In an attempt to obtain the rehabilitation of the many sub-standard buildings boarded up throughout the city, the administration provided for tax exemption on the improvements necessary in such cases and for deduction of the amortization of such costs from the owner's tax bill. Little advantage was taken of this new provision, and by the end of the year the Mayor was threatening to use the city's condemnation powers in order to put these old buildings to use.

FIRE AND POLICE DEPARTMENTS

The first post-war year brought relief to the overworked guardians of the city's public safety. As demobilization made it possible to recruit new men for the force, the three-platoon system for the Fire Department was again put into effect, and the extra tours for the police were abolished. Generous provision was made in the budget for additional personnel. So acute had been the shortage in the police force that the new members were put to work at once without the usual special police college training and before they could be uniformed.

Mayor O'Dwyer made it clear throughout the year that police administration would be as vigorous as that under La Guardia, particularly in regard to keeping large scale gambling and rackets from developing. Several intensified drives against the gamblers marked the year, and Commissioner Wallender showed no hesitation in replacing those officers who did not deliver.

A major shake-up in the Department resulted from certain sensational developments at the close of the year. In the course of the bitter election contest of Representative Marcantonio in the Harlem district, Joseph Scottareggio, a Republican captain, was beaten so badly that he died. The incident caused a terrific uproar, particularly on the part of Marcantonio's enemies who claimed he had instigated the attack. As the remainder of the year passed and no substantial results were forthcoming in apprehending the killers, the Mayor's dissatisfaction with police activity was brought to a head by the revelation that an attempt had been made to "fix" the playoff game for the professional football championship between Chicago and New York. With the complete backing of the Mayor, himself a former policeman, Commissioner Wallender effected a drastic reorganization of the entire department, including the forced retirement of many top ranking officers who were found to be physically unfit for efficient service. Their retirement opened the way for promotion of younger men with modern training and ideas.

POLITICS

The most striking feature, politically, of the year was the resurgence of Republican strength in the city. In the 1945 Mayoralty election, the Fusion candidate could secure only 302,000 votes on the Republican party line. Newbold Morris, a Republican running independently, polled 400,000 votes, many of them probably cast by independents. In 1946, the Republican gubernatorial candidate rolled up 1,179,528 votes, 60,000 more than Mayor O'Dwyer had received in his victory the year before. In addition, the Republicans captured five seats in the House of Representatives, long held by Democrats, and substantially increased their delegation in the state Senate and Assembly. This change in the fortunes of political warfare, however, does not serve to indicate that the Republicans could muster a similar vote against Mayor O'Dwyer in a municipal campaign. It serves, rather, to reemphasize the fact that Republican voters are more concerned with state and national politics than with local politics.

Both parties engaged in internal battles during the course of the year.

That attracting the most attention on the Republican side involved Congressman Joseph Clark Baldwin of the so-called "silk stocking" district. Baldwin was accused by his Republican leaders of being entirely too much of a "New Dealer" and unwilling to oppose the operations of the Democratic administration with true Republican vigor. State Senator Frederick Coudert, Jr. was designated the organization choice and, after a closely fought primary battle, obtained the nomination. Noticeable also was the failure of Vito Marcantonio to again secure the nominations of all parties, as he had done successfully in the past.

In the Democratic organization, its effectiveness was limited by the continuation of the internal battle of the previous year. An independent, or recalcitrant group, under the leadership of Frank Sampson, has been attempting to challenge the leadership in New York County of Edward Loughlin, and his chief supporters, Clarence Neal and Bert Stand. Unlike his predecessor, Mayor O'Dwyer felt it necessary to use his influence and power at City Hall in the attempt to refurbish the Democratic organization. While he had some success, he was handicapped by the fact that the opposition to Loughlin was not united, there being a rift between the leaders of those districts predominantly Italian and those of Irish background. At the close of the year, however, the Mayor had obtained the support of both state and national chairmen in his attempt to put Tammany in order. In Brooklyn, upon the death of leader Frank Kelly, the Mayor played a prominent part in determining his successor, throwing his support behind Borough President John Cashmore as against Edward Sutherland, an orthodox old-school politician. The Mayor has thus indicated his belief that the administrative chief of the city must be a political leader as well.

MUNICIPAL POLITICAL TRENDS

By Alfred Willoughby

Executive Secretary, National Municipal League

GROWTH OF COUNCIL-MANAGER GOVERNMENT

As municipal expenditures went higher and constantly larger budgets seemed inevitable under the pressure of inflationary influences, the largest number of municipalities in history sought greater efficiency through the adoption of the council-manager form of government. The manager plan was adopted by 80 cities in the United States, and another eight were added by Canada. This broke the previous record of 48 adoptions in 1921. In recent years and even during the difficult years of the depression when necessity forced greater efficiency in local public affairs, adoptions usually were under 30.

This was the most significant municipal political trend in 1946. Authorities on public administration, who are virtually unanimous in their opinion that the council-manager plan is the best which has been developed, predicted that it would become standard for American cities within the next generation.

MUNICIPALITIES ADOPTING THE MANAGER PLAN IN 1946

Alaska—Anchorage, Fairbanks.
California—Delano, Oxnard, Redding, Santa Monica, Vallejo.
Colorado—Glenwood Springs.
Connecticut—Hartford.
Florida—Cocoa, Delray Beach, Green Cove Springs, Safety Harbor, Winter Park.
Iowa—Charles City, Shenandoah.
Kansas—Emporia, Hutchinson, Junction City.
Kentucky—Nicholasville.
Maine—Bucksport, Clinton, Crystal, Freeport, Island Falls, Limestone, Madawaska, Monroe, New Canada Place, Oakfield, Orono, Rangley, Richmond, Ripley, Stonington.
Michigan—Fremont, Marquette, Saline, Ypsilanti.
Minnesota—Wayzata.
Missouri—Lebanon, Nevada.
Nevada—Elko.
New Hampshire—Conway.

New Jersey—Medford Lakes.
New Mexico—Tucumcari.
North Dakota—Fargo, Grand Forks.
Ohio—Osborn.
Oklahoma—Ada, Chickasha, Enid.
Oregon—Grants Pass, Pendleton, Roseburg, Salem, Springfield.
Pennsylvania—Hamburg, Mechanicsburg.
South Carolina—Lancaster, Spartanburg.
South Dakota—Aberdeen, Madison.
Tennessee—Paris.
Texas—Abilene, Bonham, Carrizo Springs, Clarksville, Edinburg, Odessa, Pelly, Waxahachie.
Utah—South Salt Lake.
Vermont—Cavendish.
Virginia—Falls Church, South Boston.
Washington—Moxee City.
Wisconsin—Fox Point, Madison.

Waco, Tex. voted to abandon the manager plan. Paducah, Ky.; Stockholm, Me.; Toledo, O.; El Reno, Okla.; Pittsburg, Tex.; Bennington and Hartford, Vt. voted at referenda to retain it. Proposals to adopt the plan were unsuccessful in 20 places, including Chattanooga, Tenn., where the plan lost by 612 votes after a spirited campaign.

The initiative for adoption of the manager plan is coming increasingly from mayors and former mayors and from members of city councils, who cite the growth of administrative responsibilities as the reason for putting affairs on a professional basis.

MADISON, WISCONSIN

Observers of political trends were surprised by the adoption of the council-manager plan by Madison, home of the state university and capital of Wisconsin. This surprise was owing to the fact that Madison had had a long record of honest, non-political government. There had been no scandal and no great dissatisfaction with the conduct of public affairs, which, as in other Wisconsin communities, had been on a non-partisan basis for more than a generation.

The change was voted in November, to take effect in the middle of 1947, after a study and educational campaign led by the League of Women Voters, with the cooperation of the *Wisconsin State Journal* (daily newspaper) and various civic groups. What particularly interested students of government was the fact that, in a quiet, orderly, clean campaign, the voters were able to recognize that administrative responsibility was too diffused among various boards, commissions, and independent officers.

AUGUSTA, GEORGIA

A citizens' revolt against a powerful political spoils machine in Augusta came to fruition during the year with the ousting of the Cracker Party which had held sway for 25 years, with little or no opposition, in the city and Richmond County.

The revolt was begun quietly five years previously by Berry Fleming, author of *Colonel Effingham's Raid* and the motion picture derived from it, when he returned to his home town after many years of absence. He organized the Augusta Citizens Union, which retained Dr. and Mrs. Thomas H. Reed of the National Municipal League's Consultant Service to make an administrative and financial survey of the city's government.

After the repeal of Georgia's poll tax in 1945, the Junior Chamber of Commerce conducted a "register and vote" campaign. Four times the normal number of votes were cast in the spring election, and the Crackers were overwhelmed, Independents being elected to the six offices at stake, three seats in the Richmond County Commission and three in the state legislature. In the fall election, the Independents also captured the City Council, thus gaining complete control of both city and county.

The consultants were promptly called back to make a survey of the county, to draft a new council-manager plan charter for the city and to prepare legislation to cleanse the government of bad practices. This survey included a joint city-county tax collection system, a non-partisan school board, and a modern public employee retirement system.

BOSTON

James Michael Curley remained mayor of Boston despite his conviction in a Federal court on the charge of using the mails to defraud. Pending appeal, he declined to resign. Early in the year, the attempt of civic leaders to obtain a basic change for the city was frustrated when the state legislature scuttled a bill which would have given Boston permission to vote on the question of adopting the council-manager plan with the proportional representation system of voting. A similar bill was introduced early in the 1947 legislature and a "Plan E for Boston Committee" was organized. "Liberty 1948" was the campaign slogan and the telephone number of the Committee's headquarters.

HARTFORD, CONNECTICUT

The people of Hartford, capital city of Connecticut, voted by more than two to one to replace its seriously diffused form of government with the council-manager plan. The new charter is subject to approval by the state legislature. Both political party organizations opposed the change and sought to confuse the voters with delaying tactics. After agreeing to put the question on the Nov. 5 ballot, the Board of Aldermen ordered a special election on Dec. 3. Despite the unpropitiousness of the period between Thanksgiving and Christmas for an election in which personalities were not involved, a substantial vote was cast.

The Citizens Charter Committee which spear-headed the campaign for the charter was led by William H. Mortensen, former mayor, who in 1945 had started the charter revision by appointing a special commission. Three other former mayors joined him in the campaign. The newspapers fought vigorously for the charter, and technical "ammunition" was prepared by the Governmental Research Institute, of which Leslie M. Gravlin is director.

In opposition there appeared the "Second Charter Oak Committee," a title reminiscent of the story of how Captain Wadsworth hid the Connecticut colonial charter in an oak tree in 1687. Under this banner, speakers from both parties campaigned and warned the voters "don't be managed." On the day of the referendum, the opponents complained of not having workers because they could not pay them. The proponents had the services of many volunteers, conducted a telephone drive, and brought out the vote.

TOLEDO, OHIO

The city charter of Toledo, providing a nine-man city council elected by proportional representation and a city manager, was upheld by a vote of 48,691 to 40,989 in the fourth referendum challenge since the charter was adopted in 1934. The proposal to revert to a 21-member council elected by single-member districts and the substitution of an elected mayor for an appointed city manager was defeated.

RICHMOND, VIRGINIA

By the unprecedented margin of more than four to one, Richmond, one of the few cities still having the old two-house city council which was common 50 years ago, voted to elect a commission to modernize its charter. Members of the commission indicated interest in the council-manager form of government.

ATHENS, TENNESSEE

Armed revolution flared in Athens, Tenn. in August, when, it was charged, the reigning political machine failed to insure an honest count of the ballots cast in the county election. A group of war veterans, forming the McMinn County Good Government League, had pledged citizens that their ballots would be "counted as cast." It was claimed that the well-intrenched political machine imported tough polling-place guards who roughed up the GI watchers, shot one, threw two in jail, and, an hour before the time for the polls to close, picked up the ballot boxes and carried them off to the county jail where they barricaded themselves. After a six-hour siege, shooting and the explosion of dynamite persuaded the "guardians of the peace" to surrender. County officials fled over the border, from which place of safety they tendered their resignations to the governor, and he appointed the GI candidates in their places after it was determined that they had scored a clear victory in the voting. The GIs swept the community clean of slot machines and other gambling devices, ordered an audit of the county's books, and announced their intention of setting up a non-partisan, businesslike operation with eventual adoption of the council-manager plan for both city and county.

CHICAGO

It looked very much like something new and different was coming up in the politics of the nation's second metropolis, something which may be quite unfamiliar in the memory of most living Chicagoans. Everything seemed to be happening at once. It was too early to say that the cleansing hand of reform was actually taking hold but as the year drew to a close there were these significant developments: Al Capone, who more than any other man had been responsible for Chicago's politico-crime alliance, had died at his palatial fortress-estate in Florida; the voters had declared overwhelmingly in favor of voting machines (and thus out of patience with political machines); Edward Joseph Kelly, long-time mayor and boss, was eased out of the machine's leadership and was dropped as a candidate to succeed himself in favor of a business man who had been noted chiefly for his steadfast opposition to the machinations of the organization. Martin Kennelly, self-made commercial success and head of van and warehouse companies, chosen to succeed Kelly as mayoralty candidate, is a civic reformer identified with the Chicago Crime Commission which for years has been catching the police in the acts of wrong-doing. He accepted the task of leading Democratic forces in an attempt to recoup their recent losses only if there would be no strings attached, and that was interpreted by the organization to mean an end to flagrant political abuses.

SEATTLE, WASHINGTON

A new charter was adopted by Seattle. It extended the term and increased the power of the mayor, established a new fiscal procedure, and made other improvements.

NEW ORLEANS

The New Orleans "commission-council" form of government was tightened and made more appropriate for effective administration by legislation which followed studies by the New Orleans Bureau of Governmental Research with the aid of outside experts. Mayor deLesseps S. Morrison, who the previous year had swept the last Huey Long henchman from office, made progress in instituting more efficient government.

BALTIMORE

The people of Baltimore voted in November to adopt a new "strong mayor" charter to replace their old basic document dating from 1898.

CENTRAL FALLS, RHODE ISLAND

A veterans' party, organized in Central Falls to combat gambling, vice, and political bossism, obtained control of the city council and sent its candidate to the State House of Representatives. Policies of the new party were determined by a weekly meeting along the lines of the old-fashioned town meeting.

JERSEY CITY

Mayor Frank Hague of Jersey City lost much of his waning power in state government and showed signs of weakening even in his own Hudson County. As a result of an election (with votes tallied on voting machines) which brought the famed "Hague majorities" in Jersey City to a new low, the boss found himself confronted for the third time in succession with an unfriendly governor. This meant practically the end of his already badly depleted state patronage list.

HOBOKEN, NEW JERSEY

One of Mayor Hague's friends, Mayor Bernard McFeely of Hoboken, was also in trouble. The mayor, his brother, chief of police Edward McFeely, and other McFeelys and Mc-

Feely henchmen found themselves under indictment by a Hudson County grand jury for alleged illegal acts of oppression against certain police officers who had petitioned for rights guaranteed by state law. The outraged policemen, together with the Hoboken League of Women Voters and the Independent Citizens League, thereupon gave an unprecedented beating to City Hall by forcing adoption of civil service by a referendum vote at the general election. Voting machines, used for the first time in Hoboken, were credited with having emboldened many voters to vote their convictions, without fear of reprisals following possible identification of paper ballots.

STEUBENVILLE, OHIO

A spectacular campaign against vice, started by a group of clergymen in Steubenville, quickly led to the organization of a Citizens League for Good Government. As in so many cities, the leaders of this League soon concluded that a 1947 campaign for a council-manager charter would be the best way to organize and consolidate for good government in Steubenville.

MUNICIPAL FUNCTIONS

By Herbert A. Simon

Editorial Assistant, *The Municipal Year Book*

GENERAL

The year 1946 proved a year of many surprises for American cities. It had been widely predicted that, with the end of the war and the consequent reduction in Federal spending, a substantial deflation would set in. In anticipation of this, and in order to restore public works that had necessarily been neglected during the war, cities had generally planned for a high level of public works activity. Instead of deflation, the premature elimination of OPA controls and the continued pressure of unfilled demand produced a rapid rise in prices toward the end of the year; while continuing material and manpower shortages seriously impeded public works activities. City finances were hard pressed to provide needed salary increases, while at the same time there was wide concern as to how cities would meet the equally severe financial problems that will arise when and if a deflation follows the boom.

There were other problems faced by cities in 1946 that were not surprises. In particular, the severe housing crisis continued, with no signs of immediate relief at the year's end. Cities which had organized to cooperate with the Federal Government to combat the crisis were handicapped by the progressive weakening of Federal housing policy as the year wore on.

PERSONNEL ADMINISTRATION

Attention in the field of personnel administration focused during 1946 on the subjects of salaries, veterans' preference, and unionization of public employees. In none of these fields were there any striking departures from previous developments. The pressure of increasing living costs and competition from private industry has led, as in previous years, to numerous increases in salaries and wages of public employees. In most cases these increases have been on a temporary basis, and base pay rates have not generally been changed. Partly as a result of this, municipalities are still not competing on a favorable basis with private employers for the services of persons in professional and technical occupations.

Assisted by existing and new preference legislation, large numbers of veterans entered the public service during the year. Exact figures are not available for municipal employment, but in the Federal service over 50 per cent of the civilian employees at the end of the year were veterans. On the other hand, few municipalities appear to have undertaken positive recruitment programs to secure a fair share of the best talent among returning veterans for the public service. The unsatisfactory salary situation was also an important factor in hampering effective recruitment.

Aggregate municipal employment increased somewhat as positions, unfilled during the war, were filled. At the same time, large numbers of temporary appointees were separated from employment, and others were given permanent status on the basis of examinations or other qualifying procedures. Normal civil service procedures were reinstituted, and examinations were held on a large scale to establish eligible lists.

Union activity in the public service showed a decided increase. The State. County, and Municipal Workers of America and the United Federal Workers of America (both CIO) merged to form the United Public Workers of America. Strikes of public employees occurred in a number of cities, while several jurisdictions, including the Federal Government. passed legislation banning strikes of public employees and imposing penalties on strikers. Although city officials and courts rather consistently held to the position that strikes of public employees are illegal, wage demands of the strikers were met in a considerable number of instances.

There was considerable interest in in-service training programs for public employees. A number of cities established veterans' training programs under the vocational training provisions of the GI bill.

FINANCE

The end of 1946 found cities in a strong financial position, at least from the short-run point of view, but faced with serious long-term financial problems. Many cities had reduced and accumulated surpluses in anticipation of post-war public works programs. During 1946, these cities began to dig into their surpluses and to float new bond issues as the time to carry out these plans approached.

The most serious immediate crisis was the need to expand revenues in order to meet rising costs for materials and to grant wage and salary increases to public employees. The long-term importance of this problem will depend of course on whether prices will be stabilized at or near the new levels, or whether they will return at least part of the way to pre-war levels. Assessing officials, anticipating that at least part of the increase in real estate values may be permanent, have begun to revise assessments upward, but the discrepancy between controlled rentals, on the one hand, and building costs and sales prices on the other, makes it difficult to arrive at an equitable basis for adjustment.

Spurred by these conditions, cities have continued their search for new sources of revenue. Forty California cities, and Louisville, New Orleans, New York, and Seattle now have city sales taxes. Toledo and St. Louis joined Philadelphia in the establishment of income or payroll taxes. Other cities have imposed or increased cigarette taxes, occupational taxes, public utilities taxes, business license taxes, and service charges. New York City and Providence, R. I. imposed a hotel room rental tax. The Municipal Finance Officers' Association published a bulletin, *Actual Revenue Sources of Cities*.

In two states, the issue of state-collected locally shared taxes was carried to the voters. The voters of Arizona decided that a portion of the gas tax should be returned to units of local government; in Michigan, the constitution was amended to return part of the sales tax to municipalities and schools.

An increased interest was shown in finance administration in many cities. Particularly notable were the large number of cities that introduced improvements in their accounting systems. In the assessment field, there was continued great activity in in-service training, with programs being carried on in Maryland, Kentucky, Connecticut, Oklahoma, Minnesota, Wisconsin, New York, California, and the province of New Brunswick, among others.

PLANNING AND HOUSING

If necessity were really the mother of invention, 1945 and 1946 would have witnessed a startling development of planning activities in American cities. With cities on the brink of an unprecedented period of reconstruction, both of public works and of private structures, the need for guiding new developments into constructive channels offered planning opportunities of tremendous scope. While a very gratifying but slow improvement in both the quantity and quality of planning activity was seen in 1946, as in the preceding decade, cities as a whole still fell very far short of making full use of the opportunity that was presented them for planning their growth. A number of cities completed comprehensive plans started during the war; several cities made special studies for the development of shoreline and riverfront areas; others made, or brought up to date, civic center plans. Plans for particular community services, recreation, libraries, airports, and others were made in a number of communities. New planning commissions were created in at least 30 cities.

Traffic congestion has returned to the cities to a more serious extent than ever before. As a result, most planning commissions are greatly concerned with traffic and transit plans and plans for off-street parking facilities.

An encouraging development in the planning field is that, with a constantly increasing number of cities having comprehensive master plans, plans for specialized facilities and zoning plans as well are more and more being brought into relation with an over-all scheme for the community as a whole. For those cities that undertook comprehensive planning before or during the depression, their long-term thinking is now beginning to pay dividends in terms of correct location and design of specific public and private facilities.

Direct participation of cities in the national housing program was limited only when measured against the magnitude of over-all need. More than 600 cities established emergency housing committees in response to an appeal by the Federal Government. By April, 52 cities in Kentucky, Michigan, Ohio, and West Virginia alone had allocated funds for temporary housing. In most communities, revisions of the building code and zoning ordinance, and in some cases use of parking property for temporary housing, facilitated the construction program. With stronger Federal leadership, greater support by the cities for the housing program would undoubtedly have been forthcoming, but the year ended with the Wyatt program virtually scuttled and with the nation far short of the initial goal of 1,200,000 units to be started during the year.

PUBLIC WORKS

With the end of the war, many cities had prepared to undertake extensive programs of public works to rehabilitate facilities that it had not been possible to maintain and to help combat the deflation which it was assumed would follow rather quickly on the curtailment of Federal war spending. Events caused these plans to be greatly modified. An accelerated inflationary trend in costs, and the scarcity of key material items and certain types of skilled labor led many cities to curtail and postpone their public works programs. In spite of this reduction in planned activities, the volume of public construction contracts let in 1946 was some 79 per cent greater than in 1945. Owing to the need of conserving materials and labor for housing and other essential building construction, the Federal Government has requested states, counties, and cities to defer all but the most essential public works construction.

Federal legislation passed in 1946 made available to local governments financial assistance for several types of public works projects. The Federal Airport Act authorizes an aggregate expenditure of $500,000,000 over seven years and the Hospital Survey and Construction Act $375,000,000 over five years. The Anti-Pollution Bill, providing $100,000,000 for sewage plants, died in the House without action. There was little state legislation during the year, although California, Pennsylvania, and Washington allocated substantial sums to local governments for public works construction.

Among the administrative problems that received particular attention during the year were refuse disposal methods, municipal airports, and parking facilities. A number of new incinerator plants were built, while other cities turned to the sanitary fill method of disposal. Municipal airports taken over by the Federal Government during the war are being returned to the cities, with consequent problems of reconversion to civilian use. The problems of parking and traffic congestion have already been mentioned.

TRAFFIC SAFETY PROBLEMS

An encouraging aspect of the traffic safety picture was the motor vehicle fatality rate, which in July had dropped to 7.8 per 100,000,000 miles traveled, the lowest point on record However, with increasing total automobile mileage, a peak was reached in the number of fatalities in January and February 1946 when 52 per cent more were recorded than in the corresponding months of the previous year.

The President's Conference on Traffic Safety drew up an action program to be used by states and localities in handling their safety problems. The *Manual on Uniform Traffic Control Devices* was completely revised for the first time since 1935, and the Automotive Safety Foundation created a Uniform Laws Division to aid local officials in preparing codes. Wichita, Kan. won the National Safety Council's grand award for 1945. Detroit won the grand award in the National Pedestrian Protection Contest sponsored by the American Automobile Association.

Seattle, Wash. completed an origin and destination traffic survey to determine traffic needs. Such studies have been made for 57 metropolitan regions by state highway departments in cooperation with cities. The Traffic Division of the International Association of Chiefs of Police completed training of personnel and installation of approved techniques in three cities and carried on follow-up work in a score of others. Public education on the elements of traffic safety, driver-training schools, and work with the traffic patrol activities of the public schools were intensified in many places.

CRIME PREVENTION

Crime rates continued to climb, with murder and robbery showing the greatest increases: 31 per cent and 28 per cent, respectively (based on comparisons of the first six months of 1946 with 1945). Considerable attention was given to the problems of training, particularly of the newer men; in these programs use was made of men who had received instruction at the FBI school in Washington and of the facilities available at nearby colleges and universities. Shorter hours for policemen went into effect in a number of cities.

FIRES AND FIRE PREVENTION

Both fire losses and the number of large fires reached an all-time high. The loss figure was $562,000,000 as compared to $450,000,000 in 1945, and there were 200 fires involving losses in excess of $250,000. Three spectacular hotel fires, resulting in great loss of life, gave impetus to revision of fire codes relating to hotels. In a large number of cities the working hours of firemen were materially shortened, accompanied in many places by more liberal vacation and sick leave policies. Training continued to receive considerable attention. A number of cities instituted or reorganized their fire prevention services, although this function has been slow in returning to pre-war standards. Substantial progress was made by cities during the year in the revision of building and fire prevention codes.

PUBLIC WELFARE

Although employment remained at a high level during the year, an increased burden was placed upon public welfare agencies. A large part of this burden resulted from the reconversion from war to peace, with a consequent increase in the number of persons temporarily unemployed and requiring compensation and other help. Welfare agencies also played an important role in assisting veterans and their families with the problems of readjustment to civilian life.

Case loads in all categories increased during the year, but particularly in childrens' aid and general assistance. An added strain was placed upon welfare agency budgets by the need of increasing assistance grants to meet the higher cost of living. Increases in grants were substantial but by no means kept pace with rising prices. In spite of the return of many employees from the armed services, welfare agencies encountered serious difficulties in securing sufficient trained personnel to staff their expanded programs. Welfare legislation was adopted in only a few states, because most state legislatures were not in session. The Federal Government increased its financial assistance to welfare activities through its grant-in-aid programs.

PUBLIC HEALTH

Adoption of the constitution of the World Health Organization in July was one of the most significant public health developments of the year. An Interim Commission met in Switzerland in November to handle any urgent disease problem that may arise before the permanent organization is established. The 79th Congress authorized the development of a national hospital program and appropriated funds for a hospital survey and for construction of physical facilities. It also passed the National Mental Health Act which will establish hospital and laboratory facilities for research, and grants of $10,000,000 to the states and $1,000,000 for demonstrations and personnel to assist the states in research and training.

In Alabama a constitutional amendment authorizes the state or local governments to acquire and operate hospitals. The new charter of Hartford, Conn. provides for a combined health and welfare department. A number of additional cities enacted food and milk ordinances, and New Haven carried on a program of training for food-handlers. Oregon cities completed engineering plans for sewage disposal plants, and 12 Tennessee cities without public sewers developed plans for sewage treatment or disposal plants. Indianapolis adopted a new air pollution ordinance. Dayton and Columbus, O., undertook analysis of their health needs. Posey County and the city of Evansville, Ind., inaugurated a joint county-city health department.

RECREATION

The greatest swing toward the separate recreation department—and in many cases, unfortunately, separate commissions—in any one-year period was shown in 1946. Sixty-two cities established recreation commissions or boards, 10 cities advisory boards, and 40 cities recreation departments. In Cleveland the city council and board of education created a recreation commission by joint agreement. New Orleans has combined the recreation functions of six agencies into one recreation department. Texarkana, Tex. and Texarkana, Ark. created a single park and recreation committee for the two municipalities; and Baltimore combined its park, recreation, and music work under a recreation and park board.

Interest waned in the establishment of new special youth centers, and greater attention was given to broadening activity programs, and to securing increased youth participation in program planning. Increases in recreation budgets were sufficient in many cities for both salary increases and significant increases in services. Special recreation tax levies were voted in 20 cities. Greater concern for community use as well as school use of school buildings and outdoor areas was in evidence in the planning of new school facilities, notably in New York and Los Angeles; and provision for recreation is included in much planning of new residential areas. Long-range recreation planning studies were inaugurated or completed in many cities, including Los Angeles, Seattle, Norfolk, Princeton, and Tacoma.

EDUCATION AND LIBRARIES

In the field of education the year 1946 was marked on the one hand by greatly increased discussion of schools and school problems, and on the other, by an increasingly acute shortage of well-trained teachers and by continued inadequacy of financing. Many teachers drained off by the armed forces and by war industries are not returning to the teaching profession, and the most talented young people are not now training to be teachers largely because of inadequate salaries. Strikes and threats of strikes by teachers in some jurisdictions were another indication of inadequate salaries. One step toward the alleviation of this condition was taken by the voters of California who, by initiative in the November election, specified $2,400 as the minimum salary for a teacher. Michigan, Oklahoma, and Oregon increased state aid for education. By the end of the year the teacher shortage and the salary problem had attracted nationwide public attention, and substantial increases in salary schedules were in prospect in a large number of states and cities.

The Federal Government gave considerable aid to education by increasing appropriations for vocational and extension education, by extension of the Lanham Act, by authorizing the President to accept membership in UNESCO, and by providing funds for international exchange of students. However, no progress was made in the direction of Federal aid to equalize educational opportunities or to aid communities in the construction of schools. College enrollments showed an increase of 2,000,000 (50 per cent over the previous peak), with veterans making up a large proportion of enrolled students.

Manpower shortages were a major problem of libraries, too, although the outlook was brighter because of the greatly increased enrollments in library schools and advances in the salary level of librarians. A number of states increased their financial support for both rural and city libraries, and local library revenues were greater. Special attention was given by library administrators to developing and promoting the post-war plans formulated during and after the war. Adult education activities, especially in the fields of current affairs and the "great books," continued to expand.

ADMINISTRATIVE ORGANIZATION

The most striking development in 1946 in municipal organization was the adoption, by the record number of 76 cities, of council-manager government. This brought to 689 the total number of cities in the United States operating under the council-manager form. The establishment of new planning commissions and of recreation departments in a larger number of communities has already been mentioned. The idea that new activities should be closely integrated with the existing city government has not yet taken root in many communities, as evidenced by the number of cases in which the new agencies were created as independent commissions.

Intermunicipal cooperation continues as the most popular solution to the problem of metropolitan organization. Numerous cooperative agreements were reported between cities, or between cities and counties, for fire, police, health, recreation, and utility services. A few new special districts were created, but there was little other organic change in the structure of metropolitan government.

FEDERAL, STATE, LOCAL RELATIONS

The cities were reminded again and again, as they faced the several problems enumerated above, that they are creatures of the state, limited as to their legal powers and fiscal capacities. In housing, in meeting the teacher-salary crisis, in their general personnel and revenue problems, it was clear that municipal policies would have to be geared closely to those of the state and Federal governments, and would often depend upon the availability of financial assistance from these other governmental authorities. It was encouraging, therefore, that as the year ended a committee of the Council of State Governments issued a report on State-Local-Relations, outlining a constructive policy for state legislatures in their relations to municipalities. The report, which urges states to "(a) grant greater powers to local units; (b) subject these powers to flexible administrative supervision; (c) assist localities to secure stable and adequate revenues; and (d) foster the enlargement and consolidation of local governments," may well form the basis for much needed cooperation between the states and their cities—cooperation that has not always existed in the past. Municipal officials could ask no more than that the state governments undertake to carry out this program which their own representatives have now formulated.

DIVISION VI

TERRITORIES AND SPHERES OF AMERICAN INFLUENCE

ALASKA

By Ernest Gruening
Governor of Alaska

AGRICULTURE

The Alaska Rural Rehabilitation Corporation, with headquarters at Palmer, has general administration over 140 farms with a total of about 12,000 acres, of which approximately 8,000 are under cultivation. During 1946 the Corporation continued to function by clearing land and assisting tract owners with loans for real estate development. These loans were for converting barns to conform with Territorial Health specifications for Grade A milk production, silos, or for enlarging poultry houses. It also established a new policy of making outright sales of land tracts to *bona fide* farmers, either on a cash basis or with a down payment of at least 25 per cent with the remainder on amortization payments running over 15 years with interest at 3 per cent per annum on unpaid balances. Several veterans of the Second World War have made applications to the Farm Security Administration to purchase corporation tracts. During the crop year of 1945, 1,243 tons of potatoes were marketed, 1,418 crates of head lettuce, 14,781 pounds of carrots, 8,368 pounds of rutabagas, 21,624 pounds of radishes, 16,279 bunches of radishes, 59,169 pounds of celery, 74,597 pounds of cabbage, and 396 pounds of peas. There were produced 2,131,594 pounds of Grade A and B milk in the same year.

EDUCATION

Schools within incorporated cities and incorporated school districts and rural schools are provided for Alaska's children of both white and mixed blood, for whom education is compulsory between the ages of 7 and 16, inclusive. In the 1945-46 school year, there were 66 public elementary schools in operation, employing 237 teachers and enrolling 6,452 pupils; 24 public senior high schools had a student enrollment of 1,553 with 118 teachers employed. Elementary school teachers received an average yearly salary of $2,514; senior high school teachers, $2,624. The Territorial public schools are under the general supervision of a Territorial Board of Education, with the Commissioner of Education as Executive Officer. Graduation from a three-year standard normal school or its equivalent is a prerequisite for the elementary teacher's certificate in Alaska. High school teachers must be graduates of standard four-year colleges and must have completed a minimum of 15 semester hours of education.

Additional educational facilities for native children are provided by the Alaska Native Service, Department of the Interior.

The University of Alaska, located at College, Alaska, offers four-year courses in agriculture, arts and letters, business administration, chemistry, civil engineering, education, general science, home economics, mining, and pre-medicine.

FINANCE

The condition of the Territorial Treasury for the year ended June 30, 1946, was as follows:

Balance of Cash in Banks, July 1, 1945	$ 1,656,582.00
Less Outstanding Warrants	248,737.75
Net Cash Balance on Hand, July 1, 1945	1,407,844.25
Receipts July 1, 1945, to June 30, 1946	3,512,533.12
Disbursements July 1, 1945, to June 30, 1946	3,999,008.34
Net Cash Balance June 30, 1946	921,369.03

The combined resources of Territorial and national banks on June 30, 1946, were as follows:

Capital	$ 1,145,000.00
Surplus and Net Undivided Profits	2,347,125.77
Deposits	55,233,627.56

Totals for the previous year were:

Capital	$ 1,035,000.00
Surplus and Net Undivided Profits	2,208,408.27
Deposits	55,331,987.10

FISHERIES

Alaska fisheries products in 1945 totaled 320,498,505 pounds with a wholesale value of $58,926,269.00, a reduction from the previous year of about three per cent in quantity and seven per cent in value.

For the third successive season, the canned salmon industry was operated under a wartime program sponsored by the Office of the Coordinator of Fisheries to permit greater utilization of available labor, materials, and shipping facilities. The total number of salmon of all kinds taken in 1945 was 77,971,593, as compared with 72,429,162 taken in 1944. The number of cases packed was 4,354,569 valued at $44,757,680. Compared with the 1944 pack, the output showed a decrease of 11 per cent in quantity and over 12 per cent in value. Ninety-six canneries were operated in 1945, including three floating plants, an increase of four plants over the preceding year. A total of 23,836 persons was engaged in the commercial fisheries of Alaska in 1945. Twenty-three herring plants were operated as compared with 17 in 1944. A total of 462 persons was engaged primarily in herring fishery operations during the 1945 season. The total value of the herring products was $2,973,500, an increase of about 20 per cent in volume and 21 per cent in value over the preceding year. The total value of halibut landings at Alaskan and British Columbia ports was $3,547,719.

FORESTS

The Chugach National Forest, located in the Prince William Sound region and Kenai Peninsula, and the Tongass National Forest, covering the greater part of southeastern Alaska, comprise the national forest system of Alaska. Their combined area is 20,850,000 acres. All national forest resources are available for use. Standing timber can be purchased and removed for use by local industries and individuals under specified forestry restrictions. Land classified as chiefly valuable for agriculture, mining, industrial enterprises, and townsites can be patented. Areas needed for water power development, fox farming, and other special purposes may be leased. The total estimated timber volume is 84,700,000,000 board feet, and the average volume per acre of the commercial timber stands is about 26,000 board feet. Total net receipts on the Alaska national forests for timber stumpage and for the several classes of land use during the last fiscal year was $55,691.40. Most of the timber products were utilized by the military forces. Twenty-five per cent of the gross receipts are turned over to the Territory for schools and roads. Ten per cent of all receipts are made available to the Forest Service for road and trail building.

FURS

The number of fur seal skins taken at the Pribilof Islands in 1945 was 76,964. The census of the seal herd as of Aug. 10, 1945, showed a total of 3,155,268 animals in the herd, an increase of 7.11 per cent over the number computed in 1944. During the fiscal year 1946, two public auction sales of fur-seal skins were held at St. Louis, Mo., during which 51,44 were sold. Gross receipts from these sales were $4,031,627.50.

A total of all kinds of furs produced, not including those taken on the Pribilof Islands, was 223,173, valued at $1,550,724. At the top of the list is mink, 31,339 skins selling at $564,102; second, 9,553 beaver skins bringing $286,590; third, muskrats with 152,542 pelts selling at $102,256 Owing to marten having been closed over most of the Territory, only 45 marten were trapped and sold, bringing $27,180. Other furs ranked in the following order: red foxes, lynx, blue foxes, otter, cross foxes, silver foxes ermine, wolf, coyote, polar bears, wolverines, and black bears.

HEALTH

The Territorial Department of Health is comprised of the following divisions and service units: Marine Health Unit, Mobile Health Unit. Public Health Nursing Services, Health Education Unit, Tuberculosis Control Division, Division of Sanitation and Engineering, Division of Public Health Laboratories, and Division of Maternal and Child Health and Crippled Children's Service. The most recently created division of the Health Department is the Tuberculosis Control Division. This was created in January 1946, and an appropriation of $250,000 was made for its use by the Special Session of the Territorial Legislature in March. The program consists of hospitalization of patients. Incidence of tuberculosis is nine times as high in Alaska as in the United States. A tuberculosis education program has been inaugurated throughout the entire Territory, and a universal system of chest x-rays is under way. New tuberculosis sanatoria have been opened in Seward and Skagway.

MINERALS

Before the war, gold mining amounted to over 90 per cent of the total mineral production of Alaska. The outbreak of hostilities in the Second World War put a virtual end to gold mining, culminating in the gold closing order for gold mining in the United States (though not in Canada) of October 1942, which suspended all Alaska gold mining with the exception of a few placer mining operations and one hard rock mine—the Alaska-Juneau. The close of the war has brought only a very slight resumption of this activity, owing to increased costs, unsettled industrial conditions, and the difficulty of securing an adequate labor supply. Six months before Pearl Harbor, the United States Bureau of Mines began the investigation of strategic minerals in Alaska. Since that date (Dec. 7, 1941), 46 major development projects have been completed. Favorable reports from 29 of these projects resulted in 13 mines that produced during the war. They include two antimony, one chromite, two mercury, two tungsten, one asbestos, and five coal mines. One hundred and twenty-six mineral examinations were made. The Bureau of Mines also conducted extensive investigations of the deposits of other minerals such as tin, iron, copper, lead, and zinc. The discovery of oil seeps in the Arctic slope is of particular and timely importance. The Navy and other interested agencies are conducting drilling operations in this hitherto unvisited area.

REINDEER

Reindeer constitute the only agricultural resource in western Alaska, an area about three times the size of Illinois. The Reindeer Service Field Headquarters are situated at Nome, and the Reindeer Supervisor is directly responsible to the General Superintendent of the Alaska Native Service at Juneau. The Service has inaugurated a policy of taking the reindeer as rapidly as possible out of the hands of present company organizations and placing the herds in the hands of private individuals. In 1945, 4,874 deer were slaughtered and processed through the butchering and refrigeration plant operated by the

Service on Nunivak Island at Mekoryuk.

TRANSPORTATION

The Alaska Railroad furnishes a year-round passenger and freight service between Seward and Fairbanks, Anchorage and Whittier, and to the coal mines in the Matanuska Valley. Passengers carried totaled 60,238, with passenger revenue of $338,128.46. Passenger miles totaled 6,620,911, or 28.6 per cent under 1945. The revenue from freight hauled was $4,432,633.12.

Alaska is served by five steamship companies: Alaska Steamship Co., Northland Transportation Co. and Alaska Transportation Co. of Seattle, the Canadian National Steamships of Vancouver, B. C., and Canadian Pacific Railway Co. of Victoria, B. C.

Commercial aviation is one of the major factors in the industrial life of Alaska. The number of passengers flown during the year ended June 30, 1946, totaled 97,464; passenger miles flown, 26,234,835; mail and freight carried, 6,053,258 pounds.

HAWAII

By Ingram M. Stainback
Governor of Hawaii

GEOGRAPHICAL

The Territory of Hawaii consists of eight inhabited islands in the Central Pacific Ocean some 2,000 miles west of Lower California. These islands which are of volcanic origin have a land area of 6,438 square miles, only slightly less than the combined areas of the states of Delaware, Connecticut, and Rhode Island. From southeast to northwest, the group is made up of Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai and Niihau. Included also is the island of Midway and an archipelago of rocks, reefs, and shoals extending 1,100 miles northwestward from Niihau; likewise Palmyra, a coral atoll 960 miles south of Oahu, is a part of the City and County of Honolulu.

HISTORICAL DEVELOPMENT

The social and economic development of Hawaii has been somewhat comparable to the development of the upper Mississippi Valley and the western part of the United States. Settlers from New England became teachers and traders in Hawaii long before similar groups settled in California. These early leaders cooperated with Hawaiian monarchs and their advisors in establishing a form of constitutional government. By the time the islands were annexed in 1898 the government and institutions were distinctively American. By training and experience the people were ready for territorial status. Now, 47 years later, they are emphasizing their desire and readiness for statehood.

SOCIAL AND ECONOMIC

Since assuming territorial status Hawaii has enacted legislation comparable to that of mainland states noted for their efficiency in government, particularly in the fields of public school education, public welfare service, health and the control of communicable diseases, tax structure, and labor-industrial relations. Hawaii is the only territory or state, with the exception of Wisconsin, that has extended collective bargaining to agricultural laborers.

During the last year of the war, the Office of War Information established headquarters in Honolulu for large-scale Central Pacific radio and leaflet operations as a part of the propaganda attack against the Japanese enemy. That part of this program which depended on a knowledge of the Japanese language was performed largely by a staff of Americans of Japanese ancestry recruited in Hawaii.

The territorial government continued to question the legality of the sentences imposed on civilians by the previously existing military courts under terms of the suspension of the writ of habeas corpus. This position was later vindicated by decisions of the Supreme Court of the United States.

In the seventh war loan drive, Hawaii exceeded its quota and retained its record of being the only territory or state that has exceeded every quota assigned to it.

Automobiles increased by 1,523 during the year, bringing the total registrations in the Islands in 1945 to 73,818. This increase was almost entirely in the City and County of Honolulu where the ratio is about one car to every five residents.

STATEHOOD MOVEMENT

After 45 years as a Territory, Hawaii is now closer to achieving statehood than it has been at any time since annexation as an integral part of the United States. Plans were laid late in 1945 by territorial officials for a visit to Hawaii of the Subcommittee of the Committee on Territories of the House of Representatives to study the question of statehood. This Subcommittee reported later that Hawaii is ready for statehood. Interior Secretary Harold L. Ickes urged in Washington that Hawaii be admitted to statehood because of its excellent war record.

AREA AND POPULATION

For administrative purposes the Territory is divided into four counties: City and County of Honolulu, comprising the Island of Oahu (area 604 sq. m., estimated population 1945, 348,045); County of Hawaii, comprising the Island of Hawaii (area 4,030 sq. m., population 70,049); County of Maui, comprising the Islands of Maui, Lanai, Kahoolawe, and all of Molokai, except the leper settlement (area 1,164 sq. m., population 51,378); County of Kauai, comprising the Islands of Kauai and Niihau (area 627 sq. m., population 32,650). The total area is 6,435 square miles with a population of 502,122. The principal cities are Honolulu, the capital, situated on the Island of Oahu, population 261,033, and Hilo, on the Island of Hawaii, population 28,303.

The population of the Territory grew from 423,330 in 1940 to an estimated 502,122 in 1945, exclusive of military and naval personnel. The population is greater than that of any state at the time of admission to the Union, with the exception of Oklahoma. As compared with the several states at the time of the 1940 census, Hawaii exceeded the population of the states of Nevada, Wyoming, Delaware, and Vermont, and its population was comparable to that of four other states, New Hampshire, Arizona, Idaho, and New Mexico. The racial origin of this population, in addition to the native Hawaiians and the Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. However, 86 per cent of the population is comprised of citizens of the United States. Filipino nationals make up a large part of the 14 per cent of non-citizen residents.

GOVERNMENT

During the greater part of the nineteenth century the islands formed an independent kingdom. In 1893 the reigning monarch, Queen Liliuokalani, was deposed, and a provisional Republic was proclaimed. Pursuant to the request of the people of Hawaii, expressed through the legislative branch of the Republic, and a resolution of the United States Congress approved July 7, 1898, the islands were formally annexed to the United States on Aug. 12, 1898. The Organic Act, under which Hawaii is governed, was approved April 30, 1900. Since that date Hawaii has been a full-fledged territory and an integral part of the United States.

The territorial government has the traditional divisions—executive, legislative and judicial—and is similar in form and spirit to that of each American Territory before it was admitted to statehood. Hawaii has also the usual Delegate to Congress who serves as a member of the House of Representatives without the right to vote.

TRADE AND INDUSTRY

Commercial products shipped to the mainland United States were sugar, approximate value $58,957,025; canned pineapples and pineapple juice, $26,935,494; and coffee, $1,091,000. Hawaii ranked fifth among customers of continental United States, having purchases amounting to $104,302.531.

Overseas vessels arriving and departing from ports of the Territory in 1945 numbered 2,334. This shipping amounted to 15,564,909 gross tons, or 9,281,661 net tons. Customs receipts for the year were $1,552,586 compared to $1,319,661 for 1944.

The Hawaiian Airlines, Limited began its sixteenth year of commercial air service, and transported 159.803 passengers a total of 1,207,541 air miles in 1945 as compared with 110,242 passengers flown a total of 947,588 miles in 1944.

Building permits in 1945 for all kinds of construction in Honolulu totaled 1,858, with an estimated value of $11,817,863. New construction had a value of $8,194,928, compared with the 1944 volume of $7,141,400. There were estimated to be 58,000 families in Honolulu in June, 1945, and only 45,376 dwelling units, thus indicating a shortage of 12,624 dwelling units.

Reports of business and official agencies at the end of the year showed business to be in a strong financial position. As of December. 1945, 36,875 corporations, firms or individuals were engaged in 54,412 different enterprises as employers, or self-employers. Wages paid in 1945 were the highest in the history of Hawaii, amounting to $379,362,115, compared with $318,258,500, in 1944

Postal receipts in Honolulu for 1945 were $21,994,754, an increase of $6,996,192 over 1944.

Internal revenue receipts for the fiscal year ended June 30, 1945. amounted to $173,999,227, an increase over the previous year of more than $23,217,000.

SUGAR

The aggregate value of the three leading agricultural products of the islands—sugar, pineapples, and coffee—exceeds $112,000,000. First in importance of Hawaii's crops is sugar. The 35 sugar companies operating in the Territory are capitalized for approximately $175,000,000. Some 16,000 stockholders in 1945 received dividends totaling $6,036,845. About half of the land planted to sugar-cane is owned by the plantation companies; the remainder is leased from estates, the Territorial Government, and from individuals. The sugar crop for 1945 totaled 799,427 short tons, valued at $58,957,025. Hawaii normally supplies between 12 and 14 per cent of the national needs.

The 1945 crop was the lowest for 18 years, netting 821,216 tons from the 103,173 acres harvested, a yield of nearly eight tons per acre. In 1944 the yield from 109,522 acres harvested was 874,947 tons. There were 27,746 persons employed on sugar plantations as of December, 1945. The drop in Hawaiian production resulted largely from wartime labor shortages. Sugar cane acreage dropped from 235,110 acres in 1940 to 211,311 in 1945. The unskilled employees on the plantations dropped from 35,062 in 1940 to 20,806 in 1945.

PINEAPPLES

Eight pineapple companies in Hawaii operate 12 plantations and nine canneries. They produce about 90 per cent of the world's supply. Approximately 63,000 acres of land is utilized for pineapple production. Pineapple companies, exclusive of the canneries, employ about 14,750 workers. The industry's manufacturing operations employ 11,300 workers. These figures exclude employees of the harvesting season from June to September, when an estimated 35,000 persons are employed. School children provided much of the needed harvest labor during the war years. The total pack of eight member companies of the Pineapple Growers Association of Hawaii for the fiscal year 1945 was 17,922,629 cases. During the calendar year 1945, a total of 305,895,784 pounds of canned pineapple and canned pineapple juice, valued at $26,935,494, was shipped to the mainland.

COFFEE

Coffee production for the crop year 1945 was 7,656,048 green pounds compared to 6,768,953 pounds in 1944. Coffee ranks third in Hawaii's exports, with an approximate value, in 1945, of $1,091,000. Commercial production is confined to about 4,000 acres in the Kona area on the Island of Hawaii.

FINANCES

Territorial tax collections on business and otherwise for the fiscal year ended June 30, 1945, amounted to $39,842,855, as compared to $39,617,709 for the previous year. Cash on hand and in banks on June 30, 1945 amounted to $35,390,848, as compared with $35,593,357 for 1944.

The gross bonded indebtedness, as of Dec. 31, 1945, amounted to $16,520,000. The net bonded indebtedness, after the deduction of sinking fund assets of $7,151,344, amounted to $9,368,656, as compared with $18,301,633 on Dec. 31, 1944, a decrease of $8,932,977.

The net assessed valuation of real property for the calendar year 1945 totaled $407,755,486, as compared with $407,270,321 for the year 1944, an increase of $485,165. The tax rate for $1,000 assessed valuation for real property in 1945 was established for the City and County of Honolulu at $27.26; for the County of Maui. $34.04; for the County of Hawaii, $43.60; and for the County of Kauai. $37.76. The net assessed valuation of personal property for the calendar year 1945 totaled $82,756,199, as compared with the figure for 1944 of $75,272,408, an increase of $7,483,791.

Total deposits in the 42 banks and 30 branches in Hawaii on June 30, 1945, amounted to $533,492,020, as compared with $461,095,093 on June 30, 1944, an increase of $72,396,929.

The total internal revenue collections in Hawaii for the fiscal year 1945 exceeded the total collections of any one of 14 states, being $173,999,227.

ARMED FORCES

Naval personnel of the 14th Naval District averaged 43,200 officers and enlisted men during 1945. Civilian employees in the district numbered 33,500. Estimated expenditures for the district for 1945 were $148,000,000. Fleet purchasing units expended about $36,000,000 in Hawaii for provisions and supplies. About half of the estimated $215,000,000 paid to Naval personnel in the Hawaiian area in 1945 is estimated to have been spent in Hawaii.

Army personnel in the Hawaiian area averaged more than 135,000 in 1945. Total military payroll for the period was $109,088,936.85. The average number of civilian employees of the War Department was 26,668. Gross annual pay of these employees was $72,186,508. Local purchases by the Army Exchange Service amounted to $5,322,780 during 1945. Total local expenditures by the Army in 1945 were estimated to be $221,027,347. Army installations in the Hawaiian Islands were valued at $277,093,819.

PUERTO RICO

By Max A. Egloff

Director of Information of Puerto Rico

DESCRIPTIVE

The Island of Puerto Rico is the smallest and most easterly of the four Greater Antilles. These islands, together with the Lesser Antilles, form a chain of some 200 islands which reach from the tip of Florida to the northeast coast of Venezuela. San

Juan, capital of Puerto Rico, is about 1,600 land miles southeast of New York and 1,000 miles southeast of Florida.

Puerto Rico is approximately 100 miles long by 35 miles wide. With its three small satellite islands of Vieques, Culebra, and Mona, its territory contains 3,435 square miles, almost three-quarters of which is in the mountainous interior. Puerto Rico is in the subtropics, but continuous trade winds give it a moderate all year temperature averaging 76°F. Rainfall is heavy throughout the year except in certain sections on the south coast where crops are grown under irrigation.

HISTORICAL

The Island was discovered by Columbus Nov. 19, 1493, on his second voyage. In 1508 it was conquered by the Spaniards and its Indian name "Boriquen" changed to Puerto Rico (Rich Port). Puerto Rico continued under Spanish rule for almost 400 years. It was ceded to the United States on Dec. 10, 1898, at the end of the Spanish-American War.

In 1946, Puerto Rico had an estimated population of 2,101,698. San Juan on the north coast is the largest city with an estimated population in July 1946 of 215,447. The second and third largest cities are Ponce on the south coast with an estimated population of 115,701 and Mayaguez at the western end of the Island, with an estimated 86,341 inhabitants.

Spanish continues to be the mother tongue of Puerto Rico, although English is taught in the schools. The official language is English, and most commercial correspondence with the mainland is carried on in English. The language problem remains a very serious one. A bill providing that teaching be done in Spanish with English as a required subject was passed by the 1946 legislature over the Governor's veto and sent to the President as required in the Organic Act who upheld the veto.

GOVERNMENT

The Island is governed under the Act of Congress of March 2, 1917, known as the Organic Act, and subsequent amendments. The Governor is appointed by the President of the United States by and with the consent of the Senate.

The Act provides for seven departments—Justice, Health, Interior, Education, Treasury, Agriculture and Commerce, and Labor—and the Auditor's office. The Attorney General, who is head of the Department of Justice, and the Commissioner of Education are appointed by the President by and with the consent of the United States Senate. The Auditor is appointed by the President but is not subject to Senate confirmation. The Commissioners heading the other Departments are appointed by the Governor with the advice and consent of the Insular Senate. The heads of the Departments form the Executive Council.

Since 1942, during the governorship of Rexford G. Tugwell, this Council has been composed entirely of Puerto Ricans. On July 25, 1946, President Truman nominated Jesus T. Pinero, then Resident Commissioner, to the Governorship of the Island. Pinero was inaugurated Governor on Sept. 3, 1946, marking the first time, under either Spanish or United States jurisdiction, that a native-born Puerto Rican has been named Governor.

Puerto Ricans elect their own legislature which is made up of 19 Senators and 39 Representatives. They also elect a Resident Commissioner to the United States Congress who may participate in debate and be a member of various committees but who has no vote. Elections are held at four-year intervals and on the same day as national elections. The Island is divided into 77 municipalities, each with its own Mayor and Council whose acts are subject to review by the Executive Council, made up of the Governor, Attorney General, Commissioners of Health, Interior, Agriculture, Commerce, Finance and Labor. In the November 1944 elections, the Popular Democratic Party, under the leadership of Luis Munoz Marin, President of the Senate of Puerto Rico, gained overwhelming control of both houses of the legislature. Governor Pinero is a member of this party, as is Dr. A. Fernos Isern, who was designated to take Governor Pinero's place as Resident Commissioner.

JUDICIARY

The judiciary system consists of the Insular Supreme Court, the District Court of the United States for Puerto Rico, the district and municipal courts, and justices of the peace. Appeals may be made in certain cases to appropriate higher courts, including the Supreme Court of the United States. The Chief Justice and four Associate Justices of the Supreme Court of Puerto Rico are appointed by the President, by and with the consent of the U. S. Senate. Statutory laws of the United States, not locally inapplicable, are in effect in Puerto Rico unless otherwise provided.

REPRESENTATION

Puerto Ricans are American citizens but may vote in Presidential elections only if they are residents of the mainland. They send no representatives to Congress but are represented in Washington by a popularly elected Resident Commissioner who has the right to debate, hold committee assignments, and introduce bills, but does not have the right to vote.

POLITICAL STATUS

Puerto Rico has been held by the Supreme Court to be unincorporated territory of the United States—in other words, "belonging to but not a part of." The present political status is unsatisfactory to Puerto Ricans. In October 1945, President Truman recommended that, since the existing form of government in Puerto Rico seemed unsatisfactory to a large number of its inhabitants, Congress should enact legislation to submit various alternatives to the Puerto Rican people, in order to ascertain what the people themselves desire most for their political future. The President asked the Congress to authorize for the Island a plebiscite to indicate preference among the following forms of political status: (1) the right of the Puerto Ricans to elect their own Governor with a wider measure of local self-government, (2) statehood, (3) complete independence, and (4) a dominion form of government.

FEDERAL ACTIVITIES IN PUERTO RICO

Almost all major Federal government agencies include Puerto Rico in their fields of activity, and many of the war agencies also operate there. The most important exception is the Social Security Act. Only the Child Welfare and Public Health sections operate in the Island. The Federal Government has occasionally provided special programs of which the most outstanding was the Puerto Rican Reconstruction Administration, established in 1942 to promote the industrial development of the Island.

Administrative jurisdiction of Puerto Rico is under the Department of the Interior, and the Governor of Puerto Rico makes his annual report to the Secretary of the Interior.

Although Puerto Ricans, with few exceptions, pay no Federal income taxes, the Island receives Federal aid similar to the states. In addition, the Internal Revenue Taxes collected on Puerto Rican rum sold in continental United States are turned back to the Insular Treasury and are an important source of income for the Insular Government.

Puerto Rico is inside United States tariff walls which has resulted in great dependence on the United States both as a market for exports and a source of imports. It is the second largest customer of the United States in the Western Hemisphere with the exception of Canada. Puerto Rico is also subject to the coast-wise shipping laws which prohibit the Island from shipping to and from continental United States and between ports on the Island in foreign boats.

ECONOMIC SITUATION

In 1946 Puerto Rico had an estimated population of 610 persons per square mile. It is one of the most densely populated agricultural countries in the world. In addition, large areas of the island are mountainous and are useless for agricultural cultivation. This lack of balance between populations and resources has kept at least two-thirds of the population at a low level of living. Nevertheless, in 1946 Puerto Rico was relatively prosperous. The resumption of normal shipping after the war, the beginning of post-war construction, and the Soldiers' Unemployment Bonus were the principal sustaining factors.

Puerto Rico has three principal remunerative crops—sugar, tobacco, and coffee—of which sugar is by far the most important. The sugar crop in 1946 was estimated at 908,246 tons, an increase of 12,000 tons over the previous year. Tobacco, which in 1945 was overproduced, was decreased in acreage in 1946. In 1946, Puerto Rico's 23,745 tobacco growers voted to establish a quota on production. Although coffee exports have dwindled to practically nothing, the industry is still of great economic importance and ranks second to sugar cane in area of cultivation. To overcome the threat of hurricanes, which in 1928 and 1932 practically demolished the coffee plantations, the Insular Government in 1945 set up a plan of insuring both crop and plantations. In 1946, the Coffee Industry Relief Commission was created to study and put into effect a general plan for the rehabilitation of the coffee industry.

As was expected, the production of rum decreased in 1946, as stocks of other liquors increased in the United States.

The War Emergency Program, the Insular successor to the WPA which was abolished in 1943, is continuing its relief activities, but on a reduced scale. For the year 1945-1946, an average of 13,079 per month were employed on work projects. The WEP contributed $3,000,000 to the Public Welfare Fund of the Department of Health for direct relief payments and financed the operation of school lunches and children's milk stations.

HEALTH

The birth rate increased in 1945 to 42.3 live births per 1,000 population, as compared with 41 in the previous year. The death rate decreased to a record low of 14.1 deaths per 1,000 population, as compared with an average of 17.6 for the five years 1940-1944. This record low death rate was the result of a decrease in the respective rates of almost all the leading causes of death in the Island. Diarrhea and enteritis are still first, with tuberculosis second and pneumonia third. At the present rate of births and deaths, there is an estimated net increase in population of 55,000 persons each year.

The School of Tropical Medicine in San Juan is the leading American research school for tropical diseases. Work done in the School contributed materially in establishing the value of using folic acid in the treatment of sprue, a tropical disease contracted by many American soldiers in the Pacific. Bacteriological studies made during 1946 included work on typhus, leprosy, and filiariasis.

EDUCATION

There is a serious shortage of both schools and teachers in Puerto Rico, but enrollment in public schools continues to increase. Total public day school enrollment in 1945-46 was 349,915, an increase of 19,045 over the previous year. During this year, Puerto Rico had 2,799 school buildings with 7,043 classrooms and 8,851 teachers. Out of a total estimated school population of 648,230, slightly more than half are in school and of those enrolled, over 60 per cent go to school for a half day or less.

The University of Puerto Rico, located in Rio Piedras, had a total enrollment of 5,109 in 1945-46. During the year, the University was put on the accredited list of the Middle States Association of Colleges and Secondary Schools. The University has inaugurated a Veterans Service Office to offer counsel and special courses for veterans. A Social Research Center for the study of insular social problems was established and a Mobile Theatre put into operation. Funds were granted for the construction of a new science building.

LABOR

Organization of labor has progressed rapidly in recent years. There are two Island-wide labor organizations—the Free Federation of Labor, formed in 1899, affiliated with the American Federation of Labor, and the General Confederation of Workers, formed in 1940. In 1945, the Confederation split into two factions, each retaining the parent name.

Wages in Puerto Rico are higher than elsewhere in the Caribbean for both industrial and agricultural workers. Minimum wage rates are established under both Federal and Insular legislation. Although wages have risen to an all-time high, they have failed to keep up with increased living costs and are still below United States standards. Despite this, there were no serious labor disputes in Puerto Rico in 1946.

In October 1945, the Department of Labor, in cooperation with the War Emergency Program, instituted a survey of incidence and duration of unemployment and cost of disabling illnesses, this survey to be the basis for the establishment of a social security program in Puerto Rico.

INDUSTRIAL DEVELOPMENT

Realizing that increased industrial development is necessary to help solve Puerto Rico's economic problems, the Insular Government on May 11, 1942, established the Puerto Rico Industrial Development Co., to establish and operate industries on behalf of the Government and to help finance and assist private industry. In 1946, three factories were in operation under this Company's direction—glass container and cement plants, which use native sand, clay, and limestone, and a pulp and paper plant which manufactures paperboard from waste paper. Under construction were a clay products plant and shoe and leather factories, and plans were being considered for a textile mill.

The Puerto Rico Development Bank, created by the Insular Legislature in 1942, is closely associated with the industrialization program. This bank has three primary functions: (1) to carry on refinancing operations of various kinds; (2) to act as a central institution through which all financial operations of the Insular Government can be managed; and (3) to help finance the long-range industrial development of the Island, through the Development company and private business.

AGRICULTURE

Puerto Rico's only important natural resource is land. A primary objective, therefore, is to intensify and expand land uses. On April 24, 1945, the legislature created the Agricultural Development Co., with authority and funds to develop to the utmost the commercial possibilities of the Island's agriculture.

Various other Federal and Insular government agencies are at work on the problem of making the best use of the land. Three research centers—the Agricultural Experiment Station of the University of Puerto Rico, Federal Agricultural Experimental Station, and Institute of Tropical Agriculture—carry on research to develop better plant strains and improve production techniques.

Another important aspect of the Government's program is soil conservation. In March 1946, the legislature passed the Soil Conservation Districts Act, providing for the creation of soil conservation districts and authorizing such districts to adopt programs and regulations for the protection of land against soil wastage and erosion.

LAND PROGRAM

Because the land area of Puerto Rico is so limited, in relation to population, and because land ownership has been concentrated in the hands of a comparatively small group, the question of land ownership and land use is supremely important. The Insular Legislature, in the Land Act of 1941, implemented the Joint Resolution adopted by Congress in 1900, since incorporated in Puerto Rico's Organic Act, providing that no corporation or partnership engaged in agriculture on the Island may own or control more than 500 acres of land.

The Land Act established the Land Authority to purchase land, primarily, from owners of more than 500 acres and directed it to distribute that land in three ways: (1) in plots of from one-quarter cuerda to three cuerdas (one cuerda is slightly less than one acre) to landless agricultural workers (agregados); (2) in parcels of from 5 to 25 cuerdas to individual farmers as family sized farms; and (3) in large farms of from 100 to 500 acres which are leased to experienced farmers to be operated on a proportional profit basis. Laborers on these farms share in the profits, in addition to receiving regular wages for their work.

Through June 1946, the Land Authority had acquired nearly 63,000 cuerdas of land; 16,851 parcels had been distributed to agregados. Eighteen proportional profit farms were in operation and showed a net profit of $400,000 for the year. In 1946, the Land Authority acquired the Cambalache sugar mill which was operated on a proportional profit basis. The Cambalache Central profits for the year exceeded $175,000.

PUBLIC UTILITIES

Development of power resources is the function of the Water Resources Authority. All the power facilities of the Island are now operated by this Authority. To meet the immediate need for additional power, the Water Resources Authority, in March 1946, purchased from the Army a floating power plant, "The Seapower." This is a self-contained electric power generating plant of high efficiency and with a capacity of 45,000 horsepower of continuous output. It is believed that the Seapower will take care of the increasing demand for power for the next two years.

FINANCES

General fund collections for the year 1945-46 were estimated at $81,224,576.79. The largest single source of income was the U. S. Internal Revenue tax on rum shipped to the United States which is returned to the Insular Treasury. Although there has been a continuing decrease in this item since 1943, when it reached a high of $63,000,000, it still amounted to over $33,000,000 for 1945-46. There was an increase of $1,289,000 or 60 per cent in customs duties, owing to the increasing volume of trade between Puerto Rico and foreign countries. Other Insular taxes also showed increases. Income tax receipts were up 24 per cent over the previous year. The Insular public debt, already low, was cut 20 per cent to $10,532,000 on July 1, 1946.

LEGISLATION

The Sixteenth Legislature met in its second regular session from Feb. 11 to March 31, 1946. During that time 754 bills were passed, of which 514 were approved by the Governor. Some of the important pieces of legislature enacted included the creation of an Insular Soil Conservation Committee; appropriations to the Communications Authority for construction or acquisition of a telecommunication system and to set up and operate a radio broadcasting station; provisions for the incorporation, management, and control of cooperative associations; an appropriation for a hospital of industrial medicine and surgery and of physical rehabilitation for the care of workmen injured in labor accidents or suffering from occupational diseases; and various appropriations for the construction of new municipal hospitals and rural medical health centers.

DEPARTMENT OF JUSTICE

The Department of Justice was reorganized in 1945-46. A reform of the penal system, including penitentiaries, was initiated and a system of probationary sentences instituted for first offenders. A corporation was set up to provide vocational training for prisoners and an experimental camp started for agricultural training.

PLANS FOR THE FUTURE

Puerto Rico's problems are mainly economic. It has a rapidly increasing population and inadequate income production. The program of the present Administration is to intensify the use of resources and to develop new methods of increasing income as well as to improve and extend social services, which are at present far below the accepted minimum standards.

The accomplishment of this program depends upon careful budgeting of government income. Responsibility for evolving a financial program to insure the best use of Insular Government funds lies with the Puerto Rico Planning Board, which was established May 12, 1942. The Board each year submits to the Governor and the Legislature a six-year plan or financial program which serves as a guide for appropriations.

Major activities of the Board during 1946 also included adoption of zoning regulations for all urban areas and the preparation of master plans for airports and insular highways.

VIRGIN ISLANDS OF THE UNITED STATES

By Morris F. de Castro

Acting Governor of the Virgin Islands of the United States

DESCRIPTIVE

The Virgin Islands of the United States, formerly known as the Danish West Indies, were acquired by the United States by purchase from Denmark in 1917. This group comprises three islands: St. Croix, 82 square miles in area, with a population in 1940 of 12,902; St. Thomas, 32 square miles, with a population of 11,265; St. John, 19 square miles, with a population of 722; and approximately 50 smaller, uninhabited islands. St. Thomas lies 39 miles east of Puerto Rico, and 1,400 miles southeast of New York; St. Croix, 59 miles to the southeast of Puerto Rico, and 40 miles south of St. Thomas; and St. John, three miles east of St. Thomas.

The seat of government is at Charlotte Amalie, on the island of St. Thomas, whose harbor is one of the finest in the Caribbean. The Organic Act of 1936 prescribes that the Governor and the Government Secretary shall be appointed by the President, while the Administrator for St. Croix and other heads of departments are appointed by the Secretary of the Interior. The two municipalities of St. Thomas-St. John and St. Croix, corresponding to the three largest islands, each elects by universal suffrage a Municipal Council with power over municipal finances subject to review by the Governor. These councils also confirm the Governor's appointments of municipal officers. The Governor is William H. Hastie who succeeded Charles Harwood May 17, 1946.

COST OF THE ISLANDS

The Virgin Islands of the United States constitute the latest addition to its territorial possessions, acquired in 1917 from Denmark in consequence of the threat of compulsory sale to Germany, already foreshadowed by evidence of German penetration. The purchase price was $25,000,000. This sum is by far the largest ever paid by the United States for the acquisition of territory. It represents $295 per acre, as compared with $0.02 for Alaska, $0.03 for California, $0.04 for Louisiana, $0.14 for the Philippines, and $35 for the Canal Zone. Since the transfer, it is estimated that the Federal Government has spent over $15,000,000 for the benefit of the Islands, excluding military expenditures required by the Second World War. It is estimated, also, that the Virgin Islands have paid into the United States Treasury, during the past few years, approximately $40,000,000 in internal revenue taxes collected in the United States on liquors produced in the Islands and shipped to the United States.

ECONOMIC SITUATION

Major factors in the economic life of the Islands are the bunkering activities of the port of St. Thomas, the manufacture of beverage spirits in St.

Thomas and St. Croix, and the sugar industry of St. Croix. The year 1946 showed a steady improvement in shipping to St. Thomas. A total of 353 oceangoing vessels with gross tonnage of 1,493,725 visited St. Thomas, as compared with 204 vessels with gross tonnage of 264,640 in 1945. Prospects are good for continued improvement. The tourist trade, dormant during the war, is only beginning to revive.

Underlying the economic problems of the Virgin Islands is the fact that a large amount of money is sent out of the communities in payment for food, clothes, and other commodities produced abroad, while very little money comes from the outside for things that are produced in the Islands. Every successful effort to reduce the Islands' dependence upon imported goods and services, and to increase the consumption of local products at home and their marketing abroad, will help the economy of the Islands.

SUGAR

St. Croix' basic industry, sugar, showed a production increase from 4,040 tons in 1945 to 4,970 tons in 1946, through increased acreage and acre-yield, and by improved processing. The price to the cane farmer for his 1946 crop was $8.60 per ton as compared with $6.73 in 1943 and $3.02 in 1941. The day's wage for field workers rose from $1.04 in 1941 to $1.60 in 1945, and $1.84 in 1946.

RUM AND LIQUORS

St. Croix exported 137,608 proof gallons of rum and liqueurs in 1946, as compared with 129,082 proof gallons in 1945. St. Thomas exported 817,441 proof gallons in 1946, as compared with 1,340,208 in 1945. The rum and liquor industry, upon which these Islands have depended during the past few years for their major source of revenue and for private employment of wage earners, has suffered a severe curtailment of production owing to Federal conservation orders. Still the largest single industry in the islands, rum manufacturers were turning more and more, as the year closed, to the still unrestricted manufacture of whiskies, gins, and liqueurs from neutral spirits for the continental American market.

FINANCES

On June 30, 1946 the treasury of the Municipality of St. Thomas and St. John showed an unappropriated surplus of $28,295.57. However, the revenues were increased by $216,547.62, representing surplus funds of preceding fiscal years transferred to meet this year's obligations. On the other hand, the Municipality of St. Croix required a Federal deficit appropriation of $150,000.

The revenues of the Municipality of St. Thomas and St. John were $1,112,002.07, as compared with $1,257,416.53 in the preceding year, a decrease of 11.56 per cent. Income tax collections were $622,573.27 as compared with $941,090.47 in the previous fiscal year, a decrease of 33.85 per cent. The Budget for the Municipality of St. Thomas and St. John carried total appropriations of $1,083,851.50.

In the municipality of St. Croix revenues were $262,257.54 as compared with $515,383.28 a year ago, a decrease of 49.11 per cent. Congress appropriated $150,000 toward the expenses of local government in the Municipality. Income tax collections were $103,069.94, which was a decrease of 73.64 per cent from collections in 1945 of $391,075.63. The Budget for the Municipality carried total appropriations of $421,658.

Financial and economic trends do not indicate any unusual revenue increases in the coming year. Congress has provided for a study of the municipal government by three municipal experts under the supervision of the committees of appropriations of the Senate and House of Representatives, to formulate a policy as to future assistance from the Federal Government.

FEDERAL PUBLIC WORKS PROGRAM

With appropriations totaling $2,360,005, already made by Congress for the projected construction by the Federal Works Agency of public works, health and sanitation facilities authorized by Public Law 510, approved Dec. 20, 1944, no major construction project had been started by June 30, 1946. Congress specified that all but repair projects are to be constructed by contract. The first bids opened late in the year for sanitation facilities for St. Thomas were rejected because of high costs. These projects, together with the St. Croix sanitation projects, are being readvertised.

While employment in the Islands is at a minimum, and there is urgent need for modernization of antiquated sewerage facilities and the replacement of old and overcrowded schools and hospitals, prospects for the early completion of these important facilities are not bright, because of the same restrictive factors which affect construction today in the continental United States.

HEALTH

The general health of the Islands has been good. There were no epidemics despite the primitive sewage disposal methods for large parts of the communities. Federal grants in aid of public health activities, received from the U. S. Public Health Service, have provided a major resource for substantial expansion of essential health services in the fields of venereal disease control, tuberculosis control, leprosy control, and general health training. The death rate was 16.1 per thousand and the birth rate 39.9. The infant mortality rate was 109.9 as compared with 101.2 in 1944 and 83.8 in 1943.

EDUCATION

The public school program has been maintained with senior and junior high schools, elementary schools, in-service teacher training, scholarship loans, evening schools for adults, limited vocational education, and school lunch and nursery programs. In St. Thomas and St. John, the average annual expenditure for public education per child was $66.50. In St. Croix the cost was $52.40.

SHIPPING

There has been a steady increase in shipping during the year, and prospects are brighter for the coming year; 353 oceangoing vessels with gross tonnage of 1,493,725 entered the harbor of St. Thomas during the year, as compared with 204 vessels with gross tonnage of 264,640 in 1945. The pre-war peak, however, was 1941 when 1,220 vessels with gross tonnage of 3,943,124 called at St. Thomas.

WELFARE

Efforts were concentrated on the securing of improved municipal appropriations for aid to the poor and on the obtaining of Federal aid for supplementary public assistance and welfare services through the extension to the Virgin Islands of Titles I, IV, V, and X of the Social Security Act. There is no area under the flag where American citizens are in greater need of such assistance from their government.

WEST INDIAN CONFERENCE

The Second West Indian Conference, under the auspices of the Caribbean Commission, was held in St. Thomas from Feb. 21 to March 13, 1946. For the first time, delegates included representatives of four metropolitan governments, *i.e.*, Great Britain, France, The Netherlands, and the United States. Approximately 200 persons were accommodated in St. Thomas during the 3-week sessions of the Conference. They included delegates, advisers, and facilitating personnel.

LEGISLATION

During the year, the Executive approved a total of 137 bills passed by the Municipal Council of St. Thomas and St. John, 42 bills passed by the Municipal Council of St. Croix, and 11 bills passed by the Legislative Assembly. A total of 11 bills were vetoed. Two bills were re-passed by the Municipal Council of St. Thomas and St. John over the Executive veto; one of which, an increase in wages and decrease in working hours, was sent to the President for his decision.

THE VIRGIN ISLANDS COMPANY

This is a government corporation incorporated by an ordinance enacted by the Municipal Council for the Municipality of St. Thomas and St. John in April, 1934; it is designed to manage and operate certain lands, buildings, and factories, owned by the United States, under an operating agreement between the United States and the Company. The purpose of the Company is to effect economic rehabilitation for the people of the Virgin Islands by revitalizing agriculture and industry, both of which had reached stagnation levels by 1934. No functions of other agencies were taken over or supplemented by the Company at the time of its creation. The agreement has been amended to include an abattoir, completed in 1941 as Federal Project No. 17 and currently operated by the St. Croix Livestock Association; and a market and cold storage plant in St. Thomas, completed in 1942 as Federal Project No. 18, and now operated by the Municipality of St. Thomas and St. John. Since 1941, the Company has also conducted a rural electrification project which provides alternating currrent to the country areas of the island between the towns of Christiansted and Frederiksted.

During the fiscal year ended June 30, 1946, the Company cultivated approximately 2,900 acres of administration sugar cane. Because of severe drought conditions, the last privately owned sugar factory closed in 1940, leaving The Virgin Islands Company to grind the entire crop produced on the Island of St. Croix, and consequently provide the only market for approximately 550 small growers of cane. During the 1946 fiscal year, the Company ground 47,158 tons of sugar cane (of which 14,753 tons were purchased from Federal homesteaders and small growers) producing 4,970 tons of raw sugar, sold to the Commodity Credit Corporation at $3.845 per hundredweight, free on board St. Croix, plus a support payment of $2.10 per ton of sugar cane, a great portion of which will be redistributed by the Company to labor and the small grower as their share.

AGRICULTURAL DEVELOPMENT

Numerous experiments in attempting to develop other types of agricultural pursuits in lieu of sugar cane have failed to prove that results obtained would be better than those from the island's uncertain and erratic sugar industry.

To offset sugar losses, the Company has necessarily developed the island's pre-Prohibition rum industry, more profitable than sugar, but employs comparatively few workers. The Company, through its distributor, Munson G. Shaw Co., of New York, places its rum on the continental market under the name "Government House Rum."

During the fiscal year ended June 30, 1946, the Company manufactured 71,341 proof gallons of rum, with an excess of 453,463 proof gallons of rum aging in the Company's warehouses.

SOCIAL DEVELOPMENT

Subsistence levels have been raised, decent housing and subsistence plots furnished, and sanitary systems introduced. Any governmental agency, private concern, or individual may purchase the products of the Company, rent its equipment, or otherwise have access to the services of the Company upon approval of its duly authorized officers. The Company has followed a policy of assisting hundreds of small growers and homesteaders to help themselves by renting them tractors and farm equipment, furnishing improved varieties of cane seed for planting, and grinding facilities for the sugar cane they produce. It contributes direct income to the community by making payments to the Municipality in lieu of taxes, thereby reducing the amount which the Congress would have to appropriate; moreover, through the sale of the Company's "Government House" Rum, substantial revenue taxes have been paid into the United States Treasury. However, the most satisfying point of the Federal program is the fact that an opportunity has been provided for the ultimate development of a self-sustaining economy for the Virgin Islands.

GUAM AND AMERICAN SAMOA

By William E. Neely
Lieutenant USNR; Office of Information, Navy Department

GUAM—THE ISLAND

Guam, the largest island in the Marianas group, is situated in mid-Pacific 1,500 miles east of Manila, 1,300 miles south of Japan, 3,337 miles from Honolulu, and 5,053 miles from San Francisco. It is volcanic in origin and has an area of 225 square miles. The southern part of the island is high and mountainous with a range of hills along the west coast from 700 to 1,300 feet high. The northern part is a plateau, ranging from 200 to 600 feet in elevation, and the soil, though fertile, is very shallow.

Generally, the climate of Guam is pleasant. The average yearly rainfall is 69.13 inches, 65 per cent of which falls in July and September. The minimum temperature is about 70 degrees and the maximum about 90 degrees. The island is in the typhoon belt of the western Pacific and occasionally is visited by severe storms.

Guam was discovered by Magellan in 1521 and for many years thereafter was an important stopping point for Spanish ships plying between Mexico and the Philippines. In 1898, at the close of the Spanish-American War, it was ceded to the United States and placed under the control of the Navy Department by Executive Order. It was invaded by the armed forces of Japan Dec. 10, 1941 and was occupied by the Japanese until the re-entry of United States forces in July, 1944. After the island was declared secured on Aug. 10, 1944, at the cost of 1,353 marines killed and many thousands wounded, thousands of United States military personnel and native Guamanians began the colossal task of transforming Guam into a fortress and staging area for the final assault against Japan. Within one year Guam became one of the most powerful of American advanced bases in the Pacific.

Guam now is in the process of being rebuilt and remodeled. The magnitude of the task can best be appreciated by taking into account that all the 1,750 homes in the capital city of Agana were destroyed, and the towns of Sumay, Agat, Piti, and Asan were almost completely demolished by combat operations during the war.

GUAM—THE PEOPLE

The natives of Guam are called Chamorros. The origin of the ancient Charmorros is obscure, but it is probable that they are a group that became detached and isolated in the Marianas Islands from the Prot-Malays in their migration eastward from the mainland of Asia. By reason of wars, storms, and pestilence the estimated population of 50,000 in the early days of Spanish rule had decreased to 9,630 in 1901, according to a census taken at that time by the Naval administration. A vigorous campaign in the field of public health and sanitation was instituted by the Naval government with the result that the population had increased to 23,486, as of Aug. 1, 1946. While English is the official language of the government and of the schools, the native Chamorro language is widely spoken in the daily life of the people. The predominant religion is Roman Catholicism. Throughout the Japanese occupation the people remained completely loyal to the United States and cooperated with U. S. military personnel in harassing the Japanese.

GOVERNMENT

Guam is a possession of the United States. The inhabitants are not United States citizens but are citizens of Guam and nationals of the United States. While the U. S. Constitution does not extend to Guam, most of the guarantees of the Bill of Rights have been secured to the Guamanians.

A senior naval officer is commissioned by the President as Governor of Guam and the same officer is designated by the Secretary of the Navy as Commander, Marianas Area, and Island Commander, Guam. The government is administered by departments, at the head of each of which is a naval officer responsible to the Governor and assisted by Guamanian civilians. The Guam Congress, composed of a House of Council and a House of Assembly, both elected by popular vote, sits in an advisory capacity to the Governor on matters relating to the welfare and development of Guam. On May 1, 1946 the Congress, constituted by members holding office before the war, met for the first time since the Japanese invasion. In response to popular demand a new Congress was elected July 13, 1946, with a membership reapportioned according to present population distribution.

The judiciary consists of the Court of Appeals, comprised of a Presiding Justice and four Associate Justices, two of the latter being military officers with legal training and background, and two Guamanian citizens; and of the Justice and Police Courts, both of which are presided over by the same judge, a Guamanian citizen.

On May 30, 1946 the war-born military government came to an end on Guam, and naval civil government was reestablished. On that date Rear Admiral Charles A. Pownall, USN, was inaugurated Governor.

ECONOMICS SITUATION

Guam has never been a very productive island. The natural resources are of no commercial significance. All forms of business and agriculture were disrupted by the war. The gathering of copra (dried coconut meat), formerly the chief industry on Guam, has almost ceased. A few small enterprises, such as the manufacture of soap and the making of handiwork, have provided sources of income for the island. For the most part, however, the civilian population is earning its livelihood from employment by the U. S. Navy. The Bank of Guam has reopened with resources of more than $5,000,000.

EDUCATION

During the 1945-46 school year 21 schools were rebuilt and 165 Guamanian teachers employed. Education is offered in the elementary and high school levels. The enrollment for the school year ended April 1, 1946 was 7,150. Although no training on college level is offered in Guam, plans are now being formulated for sending selected students to Hawaii and the Mainland for higher education. An Adult and Vocational Training program has been instituted for the development of skilled and semi-skilled Guamanian workers. As of April 1, 1946, 280 were receiving vocational training.

MEDICAL AND HEALTH

Upon the return of United States forces to Guam in 1944 vigorous action was taken to provide greatly needed medical care for Guamanians and to reinstitute a program of public health and sanitation. A new hospital, designated the Guam Memorial Hospital in honor of Guamanian loyalty and fervor in support of the Allied cause, has been constructed. It has a capacity of 300 beds. Other medical facilities provided include a school for native medical practitioners, a school for native nurses, and a school for native dental practitioners. A comprehensive public health program now is functioning smoothly. The steady increase of native population of Guam from 9,630 in 1901 to 23,486 in 1946 attests the general high standards of sanitation and medical care maintained on the island.

AMERICAN SAMOA

American Samoa, situated in the mid-Pacific just below the equator and 4,150 miles southwest of San Francisco, includes the island of Tutuila on which the U. S. Naval Station is located; the Manua group consisting of the islands of Tau, Olosega, Annuu, and Ofu; Rose Island; and Swains Island. These islands, with the exception of Swains, were acquired by the United States on Dec. 2, 1899 by treaty with Great Britain and Germany. Swains Island was annexed to American Samoa by joint resolution of Congress, approved March 4, 1925.

The islands of American Samoa, with the exception of Rose Island which is an uninhabited coral atoll, are of volcanic formation and mountainous, rising in places abruptly from the sea. The total area of the group is 76 square miles. Pago Pago Bay, one of the safest and best harbors of the South Seas, nearly cuts the island of Tutuila in half.

The climate of the islands is tropical but equable. From May to November strong southeast winds are experienced, and during the other months the winds are variable. Moderate gales and occasional hurricanes have been recorded. The average yearly rainfall for 41 years has been 193.5 inches. The yearly temperature ranges from 70° to 90° Fahrenheit.

The soil of the islands is of two kinds, clay and sand. In the valleys it is alluvial and quite fertile for growing tropical fruits and taro. Owing to heavy rainfall the soil on hillsides is thin and there is no subsoil.

THE SAMOAN PEOPLE

The native people of American Samoa are Polynesian and closely akin to the natives of Hawaii and the Maoris of New Zealand. The Samoan language is probably the oldest form of Polynesian speech extant. The population of American Samoa, as of June 30, 1946, was 17,077, mainly Polynesian, an increase of more than 25 per cent over the last pre-war population figure reported.

GOVERNMENT

American Samoa, classified as a possession of the United States, is under the control of the Navy Department and is administered by a Naval Governor. The inhabitants, citizens of American Samoa, are nationals but not citizens of the United States. While the Constitution of the United States does not extend to American Samoa, the Codification of the Regulations and Orders for the Government of American Samoa, printed in both English and Samoan languages, contains most of the guarantees of the Bill of Rights. For purposes of local administration, American Samoa is divided into three districts each having a Samoan governor and maintaining village, county, and district councils composed of hereditary chiefs and their advisors. The chief Samoan council, or Fono, meets annually and serves in an advisory capacity to the Governor in matters relating to the welfare of American Samoa. The judicial power is vested in Village Courts each presided over by a village magistrate; six District Courts each presided over by a Samoan District Judge and a U. S. District Judge; and a High Court presided over by a U. S. civilian Chief Justice and two Samoan Associate Justices selected from the District Judges. Capt. H. A. Houser, USN, the present Governor of Samoa and Commandant of the Naval Station, Tutuila, assumed office Sept. 10, 1945.

EDUCATION

For the year ended June 30, 1946 instruction was offered in 44 public and six private schools having a total enrollment of 3,903 and employing 95 Samoan teachers and two Samoan principals. The curriculum of the public schools is based on studies and recommendations made by members of the faculty of the University of Hawaii and by other educators experienced in the problems of Polynesian education. Attendance is compulsory for children between the ages of 7 and 15. Illiteracy in 1930 was lower than in any other United States possession—6.3 per cent. The Government Experimental Farm is the most important phase of adult education.

ECONOMY

The natural resources of American Samoa are of no economic importance. There are no minerals, timber, or fish of sufficient quantity to justify industrial development for export. Copra (dried coconut meat), the most important crop for commercial sale, produced a gross income of $27,394.21 for the period between Jan. 1, 1945 and June 30, 1946. A flourishing business in Samoan handicraft, which sprang up during the war years, has been continued in the post-war period. For the year ended June 30, 1946 the Bank of Samoa reported resources of $1,607,672.53.

MEDICAL AND HEALTH

The new Samoan Hospital established in 1946 has a capacity of 200 beds and a staff of 20 Naval Medical officers, 10 Naval nurses, and 136 Naval corpsmen. Included in the facilities of the new hospital are an insane asylum and a leprosarium. The hospital consists of eight modern well lighted and well ventilated wards, modern operating rooms, laboratory treatment room and dental clinic. A motorized Child Health Clinic, recently established, visits villages distant from the hospital.

THE DISTRICT OF COLUMBIA

By W. Reed West

Professor, The George Washington University

THE FEDERAL CONTRIBUTION

The District Government is not able to tax Federal properties that lie within its territorial limits. On the other hand, various departments of the District Government furnish services of value to the Federal establishments. It has, therefore, been the practice of the Federal Government to make a contribution to District finances applicable to each fiscal year. The amount appropriated for the fiscal year ending June 30, 1947, is $8,000,000, an increase of $2,000,000 over the amount appropriated in recent years.

THE PLEBISCITE

November 5, 1946 election day, was chosen as voting day in an unofficial plebiscite in the District to express an opinion on two questions: first, whether the voter wanted the right to vote for officials of the city government, and second, whether he wanted to vote for President of the United States and for members of Congress from the District. A total vote of 169,654 was reported in the *Washington Star* as an increase of 75 per cent over the vote in a similar plebiscite held in 1938, while the population had increased only about 50 per cent since that year. On the question of local suffrage about 70 per cent voted in the affirmative and 30 per cent in the negative; on national suffrage about 84 per cent voted affirmative and 16 negative. If the vote had not been unofficial with no assurance that it would lead to any action it is likely that a heavier vote would have been cast, but, on the other hand, a heavier vote might have brought out a higher proportion of negative votes among the less enthusiastic citizens who did not turn out at the polls this time. Militating against the movement for local suffrage is the fact that many government employees maintain voting residences elsewhere. The fact that a considerable proportion of the population of the District is Negro, probably has been a deterrent to the suffrage movement among a portion of the whites, especially in respect to the local government aspect. The argument is advanced that, in comparison with other large cities, Washington has been well governed and free from scandals. However, belief in the excellence of the local government was shaken during 1946 by revelations of inefficient management in the District jail that were traceable to weaknesses in the governmental structure of the District.

NEW DEPARTMENT OF CORRECTIONS

Some spectacular escapes from the District jail and suggestions of incompetent management led to the appointment of a special subcommittee of the House Committee on the District of Columbia under the chairmanship of F. E. Hébert of Louisiana, to report upon the penal institutions of the District. The Board of Public Welfare, consisting of persons serving without pay and acting through a Director of Public Welfare has been the local authority in charge of jails, although the Board of Commissioners is the chief administrative authority for the District. The committee found the basic difficulty in connection with the District penal institutions to be the lack of a clear responsibility in administration, although poor pay and poor training of the jail personnel, weaknesses in the plant, lack of definite policies and confusion in the basic laws have contributed to the problem. The laws in respect to the jail had been enacted while the jail had been passed in succession through the hands of the United States marshal, the President, the Interior Department, the Attorney General, the District Supreme Court, and the Board of Public Welfare.

It was recommended that a Department of Corrections be established to administer the penal institutions of the District, that the physical plant be improved, that the number of personnel be increased and reclassified, that the rules and regulations be revised, that procedures for handling escapes and emergencies be established, and that the personnel be given systematic training. As a long-range reform it was recommended that a study of the penal institutions be made with a view to revision of the basic laws. The problem in the District is complicated by the fact that its penal institutions handle petty offenders who ordinarily are cared for in local jails, serious offenders who normally are cared for in state institutions, and in addition prisoners who have violated Federal laws not exclusively applicable to the District. Immediate legislation growing out of this report was Public Law 460, creating a Department of Corrections under a Director appointed by the Commissioners, with power to promulgate, with approval of the Commissioners, rules and regulations and administer the District penal institutions. The powers of the Board of Public Welfare in respect to penal institutions were transferred to the Commissioners and the powers of the Director of Public Welfare in respect to penal institutions were transferred to the Director of the Department of Corrections.

SLUM AREAS

Another problem of public welfare has been the elimination of slum areas. The Alley Dwelling Act of 1934 had fixed a time beyond which buildings in alleys could not be used as dwellings, but it had not been found feasible under conditions arising since that time to carry out this drastic provision, and the deadline had been twice advanced. Public Law 457 extended the date again, this time to July 1, 1947. Meantime, for more than two years new legislation had been under consideration. There had been conflict between those who favored public low-rent housing and those who believed that private agencies should be relied upon.

The new legislation was based on the theory that only a public agency could plan and see to the execution of large low-rent housing projects, but that private agencies should be given an opportunity to carry out the plans. Recognizing the fact that private funds might not be forthcoming, the act makes provision for action through a public housing agency in the event that it becomes necessary. An existing agency, the National Capital Park and Planning Commission, is directed to work out, subject to approval by the Commissioners, a general plan of the areas to be developed, designating the uses to which various parts of these areas are to be devoted. To carry out the plan, the District of Columbia Redevelopment Land Agency, composed of five persons, is created, two of the members to be appointed by the President and three by the Commissioners. The sum of $20,000,000 is authorized to be placed in a trust fund for the use of the Agency in its work, primarily in the purchase of the land in areas designated by the Planning Commission. Proceeds from sales and other income will be placed in the fund, which after ten years is to be turned over to the Treasury.

The Agency is required to give a preference to private enterprise in the lease or sale of any land. However, if private enterprise is not reasonably available public redevelopment companies may be used. Effective at the termination of a year the powers granted under the Alley Dwelling Act of 1934 in the acquisition of real property are transferred to the Agency. The National Capital Housing Authority (formerly known as the Alley Dwelling Authority) is declared by the act to be a redevelopment company so that it may undertake developments under the act in the event of the failure of private enterprise to come forward. Thus the law is designed with the intent of clearing out the substandard areas of the District and providing adequate low-cost housing, permitting private enterprise an opportunity to meet the need but providing for public projects in the event that private enterprise fails.

HOSPITAL CENTER

Another project for governmental aid is the projected hospital center. The need for increased and improved hospital facilities in Washington has been serious. Recently under the Lanham Act, the George Washington University Hospital and the Georgetown University Hospital were aided in providing new hospitals, but Congress recognized a need for further increased facilities. Accordingly Public Law 648 authorized the appropriation of $35,000,000 for the purchase of a site and the construction of a hospital center by the Federal Works Administrator, of which amount the District is to provide 30 per cent. The Administrator is authorized to lease or sell the hospital facilities so provided, and of the funds so obtained 30 per cent is to go to the District. In this way, governmental aid is extended to such hospitals as may desire to participate.

COMMUNICABLE DISEASES

The District authorities have been somewhat hampered in the control of persons afflicted with communicable diseases. Anyone afflicted with a disease subject to quarantine and who by carelessness endangered the public health was subject to a fine of not more than $100 or imprisonment of not more than 30 days or both. Penalties, however, would not correct the effect on others of the carelessness of the diseased person. Under Public 664 the health officer may, on probable cause in cases of persons afflicted with communicable disease or who are carriers of such disease, order the detention of such person in a place designated by the health officer. This order is effective for only 48 hours but may be continued by a judge of the Municipal Court, with a hearing to be held within ten days, with the person present or absent in the discretion of the court. Maximum penalties for violations are raised to $300 or imprisonment for 90 days or both.

APPRENTICESHIP

In an effort to regularize the conditions of apprenticeship, to protect the interests of apprentices and to maintain a balance between the needs of the trades and the number of skilled workmen, Public Law 387 sets up an apprenticeship council consisting of three representatives from employer organizations and three from employee organizations together with one designated by the Superintendent of Schools without vote, and *ex officio* the Director of the District of Columbia Employment Center without vote. In addition, the Secretary of Labor is to name a Director of Apprenticeship from the employees of the Apprentice-Training Service set up under Public Law 308, which service is also to provide a staff for the Director. The various trades are authorized to set up joint committees which will propose training standards to be reviewed by the Council. Violations of apprenticeship agreements are to be considered after hearings by the Director under rules set up by the Council, with appeal to the Council and from it appeal to the District Court of the United States for the District of Columbia.

SERVICEMEN

A number of acts relating to servicemen were signed by the President. Public Law 372 removed in respect to loans under the Servicemen's Readjustment Act of 1944 the disability of minority of the serviceman or of a minor spouse acting jointly with him, and removed certain limitations on building and loan associations in the making of loans. Public Law 376 amended the black-out law of Dec. 26, 1941, so as to permit the Commissioners to provide services to veterans and war workers to the end of 1947. Public Law 385 authorized the construction of sewers and other services in the District and neighboring counties in Maryland and Virginia in connection with temporary veterans housing. Public Law 380 exempted a building owned by the disabled American veterans from taxation.

SCHOOLS

Public Law 624 liberalized the provisions of the retirement plan for public-school teachers. In framing the bill the House District Committee had in mind the thought of bringing the teachers' retirement law into line with the retirement plan in force for the classified Federal and District employees, except that in making computations those in the lower salary brackets were to be given an advantage over those in the higher brackets. Public Law 568 increased the salary of teachers by the flat amount of $450. Public Law 561 established two heads of departments of military science and tactics, one of whom was for the white schools and one for the colored schools. Those department heads were to take over the work formerly done by two senior high school teachers. Public Laws 514 and 644 authorized the Board of Public Welfare to operate a system of nurseries and nursery schools in the public schools and elsewhere. During the war, child day-care centers were maintained under a Federal appropriation as a means of encouraging mothers to accept employment. On the expiration of this appropriation on Feb. 28, 1946, the centers had been maintained largely through aid from the Community War Fund.

MINOR LEGISLATION

Other legislation provided that extra compensation to certain elements of the police force granted in an act of 1924 was to be treated as basic pay, in order to overcome a decision of the Comptroller General that such increases were not to be computed as basic pay for purposes of retirement (Public 417); increased the pay of members of the police and fire departments by 14 per cent, in line with the act increasing the pay of Federal employees (Public 491); amended the Unemployment Compensation Act so as to permit the purchaser of an established business to receive the benefits of the former owner's experience, in the computation of the tax rate (Public 501); enabled the Washington Railway and Electric Co. to comply with an order of the Securities and Exchange Commission under the Public Utility Holding Act of 1935, to sever relationship with certain of its subsidiaries, and removed certain legal impediments on the acquisition of stock in the Braddock Light and Power Co. by the Potomac Electric Power Co. (Public 416); permitted charitable, educational and religious associations incorporated in the District to provide for voting by mail or proxy (Public 626); provided a filing procedure in cases of adoption outside the District (Public 453); made some changes in the law in regard to the registration of nurses (Public 678); removed the prohibition in the act of 1901 against the reappointment of jury commissioners within three years of the expiration of a term (Public 674); permitted the use of decimal gradations on gasolene pumps (Public 340); authorized three additional deputies for the Register of Wills (Public 637); extended the Emergency Rent Act through 1947 (Public 472); exempted from the District inheritance tax property transfers to the Red Cross (Public 430); named a bridge on New Hampshire Avenue "The Charles A. Langley Bridge" (Public 625); and directed the office of the Recorder of Deeds to close on Saturdays (Public 606). Some of this legislation is noteworthy principally as indicating the ridiculous details with which Congress is burdened in the present system of governing the District.

PART THREE
GOVERNMENTAL FUNCTIONS

DIVISION VII

PUBLIC FINANCE AND TAXATION

NATIONAL FINANCE AND THE PUBLIC DEBT

By William J. Carson
Associate Professor, University of Pennsylvania

GENERAL

National finance in fiscal and calendar 1946 reflected the adjustments incident to war demobilization, reduction in war expenditures, resumption of peacetime services of government, reconversion of the national economy from production for war to production for peace, and requirements of the United States incident to the position in international affairs in which it found itself as a result of the war. The outlines of the nature and composition of the Federal budget in the post-war years became clearer accordingly.

From the peak of $100,400,000,000 in fiscal 1945, expenditures declined to $63,714,000,000 in 1946. In fiscal 1947 (July 1, 1946-June 30, 1947) they are estimated to decline still further to $42,873,000,000. Net receipts from taxation in fiscal 1947 are estimated to be $40,230,000,000 as compared with $43,038,000,000 in fiscal 1946 and $46,457,000,000 in fiscal 1945 when the peak was reached. The rapid reduction in expenditures in fiscal 1946 and 1947 and the continuation of receipts from taxation at wartime levels were accompanied by a reduction in the Federal deficit for fiscal 1947 to the smallest figure since before the war. In his budget message to Congress in January 1947, President Truman estimated tax receipts in fiscal 1948 slightly in excess of expenditures, thus indicating a balanced Federal budget for the first time since 1930.

In February 1946, the Federal debt reached a peak of $279,214,000,000. By the end of November 1946 it was reduced to $262,280,000,000, a reduction of $17,000,000,000 from the wartime peak. Reduction in the debt was made possible mainly by a reduction in the balances in the general fund of the Treasury from $26,000,000,000 in February 1946 to $6,665,000,000 in November.

RECEIPTS AND EXPENDITURES

During the nine years, fiscal 1939-1947, total Federal expenditures were approximately $448,640,000,000. Receipts were $227,114,000,000, leaving a deficit during the war years of $221,500,000,000. Expenditures increased from a total of $9,027,000,000 in 1939 to a peak of $100,400,000,000 in 1945 when the war effort was at its maximum. Net receipts from taxation increased from $5,165,000,000 in 1939 to a minimum of $46,457,000,000 in 1945. For the entire war period receipts from taxation were 50.6 per cent of expenditures, leaving a total of 49.4 per cent to be raised by borrowing.

VII. PUBLIC FINANCE AND TAXATION

Table I shows the receipts, expenditures, and the deficit by years for the nine-year period.

TABLE I

FEDERAL BUDGET RECEIPTS AND EXPENDITURES, FISCAL YEARS, 1939-1947

(In millions of dollars)

Fiscal Year	Net Receipts	Expenditures	Excess of Expenditures
1938-39	5,165	9,027	3,862
1939-40	5,387	9,297	3,910
1940-41	7,607	13,765	6,158
1941-42	12,799	34,290	21,491
1942-43	22,282	79,702	57,420
1943-44	44,149	95,573	51,424
1944-45	46,457	100,398	53,941
1945-46	43,038	63,714	20,676
1946-47 Estimate	40,230	42,873	2,643
Total	227,114	448,639	221,525

FEDERAL EXPENDITURES

Total expenditures for fiscal 1947 of $42,873,000,000 are approximately $21,000,000,000 smaller than expenditures in fiscal 1946. The principal purposes for which the expenditures of $42,873,000,000 in fiscal 1947 will be required and the amounts for the corresponding purposes in fiscal 1946 were reported by President Truman in his budget message and are given in Table II.

MAJOR ITEMS OF EXPENDITURES

(In millions of dollars)

	Fiscal 1947
National defense	15,150
Veterans' services and benefits	7,601
International affairs and finance	5,638
Interest on public debt	4,950
Refund of receipts	2,155
Other activities	7,397
Total	42,873

The item of $15,150,000,000 for national defense includes the outlays for the Army, Navy, and supporting defenses. The figure is approximately $30,000,000,000 smaller than in fiscal 1946. In his budget message, President Truman noted that, though the United Nations is expected to move

TABLE II

FEDERAL EXPENDITURES

(In millions of dollars)

Description	Estimated Fiscal 1947	Actual Fiscal 1946
General and Special Accounts		
National defense	15,150	45,066
Veterans' services and benefits	7,601	4,414
International affairs and finance	5,638	1,831
Social welfare, health and security	1,570	1,113
Housing and community facilities	525	158
Education and general research	71	88
Agriculture and agricultural resources	1,582	1,035
Natural resources not primarily agricultural	727	275

Finance, commerce and industry	176	216
Labor	124	104
General government	1,483	989
Interest on the public debt	4,950	4,748
Refund of receipts	2,155	3,119
Reserve for contingencies	10	—
Adjustment to daily Treasury statement basis	—	997
Total, general and special accounts	42,698	65,019
Total checking accounts of wholly owned Government corporations and credit agencies with U. S. Treasurer (net)	175	1,305[1]
Total budget expenditures	42,873	63,714

---

[1] Excess of credits, deduct.

successfully toward world security, the United States must continue to make large expenditures for national defense in order not to weaken its international position. The items for fiscal 1947 and 1948, he said, represent a proper balance between security and economy.

The figure of $7,601,000,000 for veterans' services and benefits is to provide education, rehabilitation (including pensions), insurance, readjustment benefits, hospitals, and other services. This item is an increase of $3,187,000,000 over the amount required in fiscal 1946. Expenditures of $5,638,000,000 on international affairs and finance are to cover outlays for foreign relief, contractual commitments in connection with the loan agreement with the United Kingdom and under the reconstruction lending program of the Export-Import Bank, and for support of the growing load of work in the field of foreign relations.

Interest on the public debt is approximately $5,000,000,000. The item refund of receipts is to cover refunds that are fixed obligations due under present tax laws.

The remaining figure of $7,400,000,000 is to cover the outlays for social welfare, health and security, housing and housing facilities, agriculture and agricultural resources, transportation and communication, services to business and labor, general government functions and operations, and others.

REVENUE AND TAXATION

Net receipts during fiscal 1946 totaled $43,038,000,000. In fiscal 1947 receipts are estimated to decline to $40,230,000,000. Direct taxes on individuals are estimated at $18,637,000,000 in fiscal 1947, direct taxes on corporations at $9,227,000,000, and excise taxes at $7,283,000,000. In the budget message, the President pointed out that receipts from direct taxes on individuals will decrease from the fiscal year 1946 to 1947 because of the lower effective income tax rates in the Revenue Act of 1945. Direct taxes on corporations will decline in fiscal 1947 largely because of the repeal of the excess profits tax. The returns from excise taxes are expected to increase in 1947 because of increased consumer demand and increased production. The details of receipts and revenues are given in Table III.

SIZE AND DISTRIBUTION OF THE PUBLIC DEBT

At the close of the fiscal year ended June 30, 1945, the Federal public debt was $258,682,000,000. By February 1946, the total had reached $279,214,000,000, the peak for the war period. By June 30, 1946, the total had declined to $269,422,000,000, and by November 1946, it had declined still further to $262,277,000,000, approximately $17,000,000,000 below the peak of February 1946.

The reductions were due mainly to

[1] Source: *Federal Reserve Bulletin*, December 1946, p. 1387.

the policy of the Treasury to use its cash balance to retire securities rather than to replace maturing obligations with new issues. This policy is revealed in the decline in the cash balance of the general fund of the Treasury from $25,961,000,000 in February 1946 to $6,665,000,000 in November.

Table IV shows in detail the volume of the Federal debt on June 30, 1945 and Feb. 28 and June 30, 1946, and the composition of the debt by type of security.

The debt retirement program, that began early in 1946, was a major factor of change in the ownership of marketable government securities. Table V which shows in detail the changes between Feb. 28 and Sept. 30, 1946, indicates the shifts that took place during the first seven months period of debt reduction.

In the "Review of the Month" in the *Federal Reserve Bulletin,* October 1946, the Board of Governors of the Federal Reserve System summarizes the changes as follows:

"The bulk of securities redeemed for cash was held by the banking system and largely by commercial banks. It appears that, of $15,500,000,000 of securities redeemed in cash from March 1 to Sept. 30, approximately $3,200,000,000 were held by Federal Reserve Banks, $8,000,000,000 by commercial banks, and $4,300,000,000 by non-bank investors. Total holdings of marketable government securities by commercial banks are estimated to have declined by $13,000,000,000 during the period, indicating sales of about $5,000,000,000 in addition to cash redemptions of securities held by them. The additional securities sold were absorbed largely by the Federal Reserve Banks, which made purchases on the market in order to offset the loss of reserve funds resulting from the retirement of Federal Reserve security holdings. Market purchases by Reserve Banks amounted to $4,300,000,000 and on balance their holdings of Government securities showed an increase of $1,100,000,000.

"Non-bank investors showed a net decrease in holdings of marketable securities of $3,400,000,000. Of this amount, it is estimated that corporations reduced their holdings by approximately $2,700,000,000 and individual investors by $1,000,000,000. The decline in holdings of marketable

[2] Total includes guaranteed securities not included in classification of marketable issues by owners.

issues by non-bank investors as a group fell short of the amount of their cash redemptions by about $1,000,000,000, indicating that on balance they had absorbed a like amount of securities sold by commercial banks.

"Outside the banking system this picture is somewhat modified if changes in the holdings of non-marketable public and special issues are included. Non-marketable public issues outstanding declined by $1,200,000,000, reflecting a sharp decline in savings notes, which are mostly held by corporations, and some increase in savings bonds, which are largely held by individuals. Holdings of special issues by Federal agencies continued to increase. Increased holdings of government securities by insurance com-

panies, mutual savings banks, and Federal agencies offset a part of the decline in holdings of corporations and individuals."

Examination of the figures in Table VI shows that almost all of the increase in the public debt between June 30, 1945 and June 30, 1946 was taken by non-bank investors. Increased holdings were reported by all types of non-bank investors except "other" corporations and associations. Holdings by commercial banks were smaller than the year before, while those of Federal Reserve Banks were slightly larger.

Reductions in debt holdings by the commercial banks and increases in the holdings by non-bank investors have long been advocated as developments to lessen the dangers of inflation resulting from war financing. Continuation in the latter half of calendar 1946 of the program of debt retirement as shown in Table V accordingly was a further anti-inflationary measure.

BOND PRICES AND YIELDS

Rates at which short term bills were issued continued through October 1946 at the same levels as in 1945. In November, however, they were slightly higher. Rates on medium and long-term obligations, after reaching the low levels in March and April, increased during the remaining months of the year. Yields on 3-5-year Treasury notes increased from .99 per cent in April to 1.24 per cent in October. Yields on long-term taxable bonds, due in 15 years and over, increased from 2.08 per cent in April to 2.28 per cent in September. In October and November, yields declined slightly, averaging 2.25 per cent in November. Yields on long-term bonds were generally lower than in 1945; those on 3-5-year notes were lower in the first half of the year but higher in September, October, and November than in the corresponding periods of the previous year.

Prices of government bonds declined from the peak of 106.61 reached in April to 103.25 in September. In October and November they averaged slightly higher than in September. Throughout the year prices were higher than in 1945.

The firming of rates after the first quarter of the year reflected the influence of the program of debt retirement by the Treasury and the increased demands for funds by business for new plant, equipment, and enlarged working capital.

Tables VII, VIII and IX show in detail the course of yields and prices by months in 1945 and 1946.

"INFLATIONARY" EXPANSION

"Inflationary" expansion continued to be a dominant problem in 1946. In January 1946, President Truman called attention in his budget message to the inflationary pressures then present, recommended against further tax reduction, and urged that a move be made toward debt retirement and a balanced budget. The fiscal policies subsequently adopted, including the debt retirement program that began in February and the executive action taken in the summer to place expenditure ceilings on some activities and to hold outlays well below the amounts available under appropriations already made, were designed in part as anti-inflationary measures.

A year later, in January 1947, the President again emphasized that the dangers from inflationary pressures were still present and recommended further curtailment of expenditures and the maintenance of taxes at the 1946 levels as the desirable steps in the fiscal program for fiscal 1948 to deal with them.

STATE FINANCES AND TAXATION

By Charles F. Conlon

Executive Director, Federation of Tax Administrators

GENERAL

State tax collections continued their upward surge during the fiscal year 1946 and again hit an all-time high. At the same time, latest available figures indicate that the gross debt of the states is still declining while balances in the general, highway, and post-war reserve funds continue to increase. On the other side of the books, state expenditures are rising; in addition to demands for new or expanded programs the states as employers of personnel and purchasers of material are affected by the higher prices prevailing generally.

For the immediate future the states' revenue structure appears to be adequate, and no sharp decline in yields is anticipated. The total amounts available for general fund expenditures in the states may be less in the next biennium than at present since the probabilities point to a more widespread use of dedicated revenues and shared taxes. Rising costs of materials and services, resumption of capital outlays and disbursements for veterans programs, particularly the military bonus, may be expected to add a considerable amount to the financial burdens of state governments in the near future.

REVENUES

The record high state tax collections reported by the Bureau of the Census for fiscal 1946 were made in spite of a decline in unemployment tax yields for the second successive year (Table I). Unemployment taxes aside, collections for the year exceeded those for 1945 by 13 per cent. This increase was contrary to general expectations in as much as budget estimates were in many instances revised in the late summer of 1945 to take into account an anticipated decline in income payments predicated on the expected wide-scale unemployment following the end of the war. Perhaps, too, there was some failure to appreciate fully the ability of the state tax system to respond to the increase in prices for many items. At any rate, pessimistic estimates of revenue yields in the last half of fiscal 1946 did not materialize. Cigarette taxes were increased in a few states during calendar 1945; otherwise there were no significant changes in rates to which the higher yields might be attributed.

Income tax collections, higher than ever before, almost doubled the yield of 1941 and brought in $500,000,000 more than in 1939. Corporate income tax collections were down slightly from the preceding year but this loss was more than offset by the $35,000,000 increase in individual income tax collections.

Gasoline tax collections were up $200,000,000 over the preceding fiscal year, and collections are now running at an annual rate in excess of that for 1942, the previous high year, despite a definite drop in the total number of motor vehicles registered. Sales taxes, up $125,000,000 over 1945, made their largest gain ever in a single year. The yield from this tax is about double that of 1939 even though rates have been lowered and exemptions increased in the intervening years. In particular states the following large increases in sales tax yields were noted: California, $28,000,000; Michigan, $19,000,000; and Illinois, $16,000,000. Indiana, whose gross income tax is usually classified among the sales taxes, was the only state reporting no significant gain over fiscal 1945.

Revenue from the sale of alcoholic beverages increased $90,000,000 over the previous year, and it is worthy of mention that applicable tax rates, Federal and state combined, are the highest ever imposed on this commodity in the United States. The yield of state tobacco taxes was $50,000,000 higher than in fiscal 1945, and the rate of current collections indicates another rise in fiscal 1947. The return to civilian status of several million members of the armed forces, who presumably smoked tax-free cigarettes, accounts in large part for the continually increasing yield in tobacco taxes.

Property taxes, down 17 per cent, continued a long-time trend emphasizing their relative unimportance in the overall state tax picture. In 1915 property taxes constituted 50 per cent of state tax collections while today, unemployment taxes excluded, they are but 5 per cent of the total.

There are reasonably good prospects that state tax collections will hover around present levels or at least not far below them. At a recent conference on revenue estimating sponsored by the Research Section of the National Association of Tax Administrators, it was suggested that somewhat lower yields might be anticipated in 1947 because of the expectation of some slight recession in business activity and a general re-adjustment of prices.

EXPENDITURES

State expenditures for the latest available year, 1945, continued their upward trend. Including provisions for debt service the figure for 1945 is $6,020,000,000 as against $5,500,000,000 for 1944 (Table II). Operating costs were $2,257,000,000, an increase of ap-

[1] Includes taxes from the following sources: insurance premium, public utility gross receipts, pari-mutuels, admission and amusement sales, soft-drink sales, licenses for corporations in general alcoholic beverages, hunting and finishing, occupations, chain stores, amusements, and race tracks; poll, documentary and stock transfers, and miscellaneous taxes.

proximately 7 per cent. The principal increases in operating costs were in connection with highways, health, and public welfare. Operating costs of schools were practically unchanged.

Capital outlays were 18 per cent below those for 1944 but this declining trend was undoubtedly reversed in the current year. As a matter of fact, were it not for the extremely high prices in the construction field most of the states would have been fully embarked on the long-range capital outlay programs which were scheduled for undertaking immediately after the end of the war.

Some idea of the increase in construction costs may be gained from the following reports. A survey conducted among 107 cities by the American Public Works Association in October 1946 indicated that current labor costs were 22 per cent higher, and material and equipment costs were 21 per cent higher than in the previous year, and that bids averaged 28 per cent more than estimated costs. Data furnished by several state highway engineers and summarized in the June 1946 issue of *Better Roads* show current highway construction costs about 50 per cent over comparable costs in 1940.

Statistics recently released by the Bureau of the Census (*Government Employment*, Vol. 6, No. 5) show a continuing decline in the number of state employees, excluding schools, while payrolls have increased. For the month of July 1941 there were

[1] Includes direct payments and payments through sinking funds for general debt only. For remainder of debt service, see provision for debt retirement above.

569,000 employees as against 469,000 in July 1945. Payrolls in July 1941 totaled $64,200,000 as against $72,200,000 in July 1945.

State salary scales were generally increased during the war, usually on a temporary basis. The Council of State Governments estimated that the overall wartime salary adjustment was not in excess of 15 per cent. Permanent adjustments will doubtless receive consideration in forthcoming legislative sessions.

In addition to the increases in operating costs arising out of higher prices generally, the states will meet with requests to expand educational and welfare programs, provide housing and veterans aid, and pay a military bonus.

Illinois, Massachusetts, Michigan, New Hampshire, Rhode Island, and Vermont are paying or have approved the payment of the military bonus. The estimated cost for these states is $863,000,000. New York has taken the first steps looking to the payment of some $400,000,000. Including the latter, the estimated cost in sight in these seven states is $1,263,000,000 which may be compared to total state tax collections of $1,305,000,000 in 1925 and $1,724,000,000 in 1933. Only in Maine, have the voters failed to approve the bonus. Of the three bonus propositions approved by the voters in November 1946 elections, only one law contained provisions for financing the outlay. On the basis of these developments therefore, a strong pressure for similar bills is foreseen in the 44 legislatures convening in 1947.

State aid to local governments grows in amount yearly, and there is no prospect that this trend will reverse itself. The adoption of the Moore Plan in New York with its fixed per capita payments to localities was a departure from established methods. However, present indications are that legislatures will be faced with requests for the sharing of state-collected taxes with the local governments. In many states, the municipal governments particularly have gone on record favoring the shared tax as a means of relieving their financial problems.

FINANCIAL POSITION

From the standpoint of total outstanding debt and available balances in general and special funds, the states are in a much sounder financial position than either the local governments or the Federal Government. For several years past, debt has declined and balances increased. The latest available data for the states as a whole show that gross debt declined $268,000,000, or 9.6 per cent in the year 1945 as compared to 1944 (Table III). During the same period balances in general highway and post-war reserve funds increased about $597,000,000 or 36 per cent (Table IV). From 1943 to 1945 there was an increase of about 107 per cent in the total of these funds. Roughly, half of these balances, on an overall basis, are in the general funds. Balances in unemployment compensation funds increased 25 per cent in 1945 while sinking fund balances declined 6 per cent (Table V).

As a practical matter, however, these balances are subject to numerous obligations. State institutions and plant deteriorated during the war. Little or no additional plant was built during that period. Deferred maintenance, plus the normal increment to state plant and institutions, will have to be provided in the relatively near future, and in this sense balances in general funds are for all practical purposes obligated even though not yet appropriated or earmarked. The same situation obtains with respect to highway construction and highway fund balances, while the numerous propositions for aid to veterans, including loans, business aids, and housing, will impose a heavy charge on postwar reserves now available.

LEGISLATION

General.—While 1946 is classed as an off-year for state legislatures nevertheless 25 of them met in regular and special sessions. Various emergencies, including housing and veterans' legislation, accounted for the numerous special sessions which in some states ran as high as three. Tax legislation was on the whole not significant. On

the expenditure side several legislatures approved bills to submit proposed commitments on behalf of veterans to the voters. There were no new enactments or repeals in states imposing income, general sales, and tobacco taxes.

Alcoholic Beverages.—A special additional tax was levied on wholesalers and retailers of liquor in South Carolina. The wholesaler must absorb the tax of from $.25 to $1 per case and the retailer must do likewise on a tax of $1 per case. Neither tax may be added to the consumer's price. In Louisiana the parishes and municipalities were authorized to impose a gallonage tax.

Banks.—Missouri imposed a 7 per cent income tax on financial institutions, and New Jersey passed a new financial business law taxing the net worth of competitors of national banks. Cities in Virginia were authorized to levy local taxes on bank shares.

Corporation Taxes.—There were few changes other than of a technical nature affecting franchise taxes measured by property or income, or corporate income taxes. However, assessment and collection practices under the Louisiana franchise tax were completely revised, and New York provided that combined rather than consolidated reports should be required from related corporations. The question of cooperatives was considered in Mississippi where a new law makes non-profit electric cooperatives subject to tax on income derived from sales of commodities or merchandise as a business. The tax status of cooperatives will be investigated in several legislatures in 1947 if present indications are accurate.

Personal Income Taxes.—Personal exemptions were increased in Missouri as follows: single $1,000 to $1,200; married $2,000 to $2,400; dependents $200 to $400. Mississippi granted a $1,000 exemption to estates and trusts. Kentucky changed its method of personal exemption to provide for a specific credit against the computed tax. New York returned to its former practice of taxing residents on total income and allowing non-residents a credit against taxes paid to other states. Louisiana, on the other hand, enacted a law to grant its residents credit on taxes paid elsewhere. The simplified return, patterned after the short Federal return, was made op-

TABLE V

BALANCES IN UNEMPLOYMENT COMPENSATION AND SINKING FUNDS, 1943-1945*

Balances in	1945	1944	1943	Per Cent Change From 1944 to 1945	Per Cent Change From 1943 to 1945	Per Cent Change From 1943 to 1944
Unemployment compensation funds	$6,452	$5,159	$3,818	25	69	35
Sinking funds	642	684	617	−6	4	11

* Source: Bureau of the Census, *State Finances: 1945*, Vol. II, No. 4.

tional in Kentucky, while numerous technical changes affecting deductions, exclusions, dependents, and filing requirements were made in Louisiana, Mississippi, New York, and Virginia.

Inheritance, Estate, and Gift Taxes.—Reciprocal exemption of charitable transfers to domiciliaries of other states was authorized in South Carolina, while the apportionment of Federal and state estate taxes was regulated by laws in Connecticut and Virginia.

Motor Fuel Taxes.—New taxes on motor carriers were introduced in Mississippi and Virginia. The intent of both statutes is to require carriers using the highways of the state to pay a tax on the motor fuel consumed thereon. Purchase of tax-paid gasoline within the state commensurate with travel within the state is one method provided to discharge the tax liability. Otherwise a report and payment of tax are required. The Mississippi law provides for a differential of $0.01 additional if motor fuel other than gasoline is used by the carrier. Georgia and Kentucky were added to the states granting refunds on gasoline used for agricultural non-highway use. One cent of the tax is retained by the state in Georgia, and 10 per cent of the tax is withheld in Kentucky. The exemption method for non-highway use in North Dakota was repealed by the voters in that state, and after the first of the year the tax will have to be paid and a claim for refund filed. Kansas and Oklahoma are now the only states using the exemption method. Revenue-wise, numerous other changes in gasoline tax laws were unimportant.

Miscellaneous.—Missouri enacted a new classified property tax law. Intangibles are now taxed at the rate of 4 per cent of yield. Veterans' exemptions from property taxes continued in number. Massachusetts, New Jersey, and Rhode Island increased the states' share of pari-mutuel pool, by raising the tax or taking some of the breakage. Virginia apples will be taxed 1¼ cent per bushel to promote the sale and consumption of this commodity through advertising.

Referenda.—In addition to the bonus proposals mentioned previously, voters approved the following expenditures: California, $100,000,000 increase in funds for loans to veterans to purchase homes and farms; New Jersey, $35,000,000 for veterans' emergency housing; Texas, $25,000,000 to finance land purchases for resale to veterans. California rejected a proposal to make business loans to veterans. Louisiana increased homestead exemptions for veterans from $2,000 to $5,000 for the period 1941-52. Increased state financing for school purposes was approved in California, Michigan, Oregon, and Utah. Specific revenues were dedicated for that purpose in both Michigan and Utah.

TAX RATE CHANGES

There were few changes in tax rates during the year 1946. The tables (V through XII) in The American Year Book for 1945 remain substantially unchanged with the following exceptions:

Arizona

Exercises on alcoholic beverages increased 50 per cent.

Illinois

Tax on cigarettes increased to .03 after December 31, 1946.

Massachusetts

Additional 1½ per cent imposed on corporate incomes for the years 1947-50 in place of the 2½ per cent additional enacted in 1945.

Mississippi

Rate on motor fuels other than gasoline increased from .06 to .07.

New York

Permanent 4½ per cent rate on corporate income reinstated.

Personal income tax reduced 50 per cent for years 1945 and 1946.

(Reduction of 25 per cent previously in effect.)

Oklahoma

Temporary additionl 2¢ tax on gasoline expires Dec. 31, 1946.

Virginia

Motor fuel tax rate increased from .05 to .06.

SUPREME COURT DECISIONS

Five tax cases presented to the United States Supreme Court involved immunities founded on the constitutional relationships between the Federal and state governments. The most widely noticed, *New York* v. *United States*, concerned a Federal tax on spring water bottled and sold by the state of New York. The tax was upheld. There were four opinions handed down with no clear cut basis of decision since the non-dissenting justices were agreed only on the point that the previous test of validity, *i.e.* whether the activity was governmental or proprietary, was no longer tenable. In another case the Court said that the Pennsylvania definition of real property governed the application of a Federal statute within that state (*Reconstruction Finance Corporation* v. *Beaver County*). The RFC is exempt from personal property taxes, while under Pennsylvania law machinery essential to the operation of a factory is considered as real property. Other rulings upheld the taxation of property sold conditionally by the United States with reservation of title for purpose of security (*S. R. A.* v. *Minnesota*); the application of the Arkansas severance tax to lumber cut by private contractors within a Federal area (*Wilson* v. *Cook*); and the imposition of Oklahoma motor fuel taxes on gasoline used by a Federal contractor within a Federal area (*Sanders* v. *Oklahoma Tax Commission*—certiorari denied). Doubts as to the constitutionality of state taxes on insurance premiums which arose after the *Southeastern Underwriters* decision were dispelled in *Prudential Insurance Co.* v. *Benjamin,* wherein the Court construed the McCarran-Ferguson Act to mean that the business of insurance even though transacted in interstate commerce does not require uniformity of treatment.

In two other cases before the Supreme Court it was decided that the Indiana gross income tax may not be applied to the proceeds of a sale of securities on the New York Stock Exchange (*Freeman* v. *Hewit*) and that the California retail sales tax as applied to a sale of oil to the New Zealand government was in violation of the constitutional prohibition against a tax on exports. A drummer type license ordinance was struck down (*Nippert* v. *City of Richmond*), and in another case (*West Publishing Co.* v. *McColgan*) the Court approved a California ruling that a formula method of apportioning income derived from interstate operations may be required even though the taxpayer maintains separate accounting for operations in various localities.

STATE COURT DECISIONS

Among the more important of the decisions of the state courts were the ruling that the Arkansas sales tax act is not applicable to a sale technically consummated outside the state (*Commissioner of Revenue* v. *Hollis*); a similar ruling in Arizona (*Pratt-Gilbert Hardware Co.* v. *O'Neil*); approval of the South Carolina refund law on gasoline used for agricultural purposes (*State ex rel Edwards* v. *Query*); affirmance of the taxability of contractor-occupied but government-owned factory property in Washington (*Boeing Aircraft Co.* v. *Reconstruction Finance Corporation*), and the striking down of the third Kentucky chain store tax statute on constitutional grounds (*Reeves* v. *Adam Hat Stores Inc.*).

TAX STUDY COMMISSIONS

The existence of many fiscal problems—state and local tax relations, the financing of schools and welfare functions, veterans' programs, concern about the tax base in the near future and other such questions—account for the number of tax study commissions now in operation. At least 13 states have officially appointed commissions of this type. Most of them expect to complete reports and recommendations in time for action at the 1947 legislative sessions. These states are Alabama, Florida, Indiana, Iowa, Louisiana, Maryland, Michigan, Ohio, Oregon, Rhode Island, Utah, Virginia, and Vermont. Some reports have already been issued, as in Utah where the commission's report was received by the legislature and propositions for amendment of school finance arrangements were formulated and placed on the ballot for approval by the voters at the November election. The Sherbow Commission report in Maryland makes comprehensive recommendations for adjusting state and local financial relations. The Iowa commission has already issued its preliminary report with recommendations for the improvement of the state's tax structure.

Among the specific subjects under study are the tax status of cooperatives, the sharing of state revenues with municipalities, assessment of public service corporations, unified revenue administration, statewide assessment of real estate, and the effect of tax limitation. The outstanding development from the field of tax study commissions was the implementation in 1946 by the New York state legislature of the report of the Moore Commission. The essence of the plan, as mentioned previously, lies in the provision of fixed per capita payments to the localities in lieu of shared tax revenues. The operation of the system will be watched carefully since it is the first comprehensive plan of adjustment of state and local fiscal relations to be placed in operation.

ADMINISTRATION

The Department of Revenue was created, effective July 1, in Missouri. The new department assumed powers in tax administration formerly exercised by the auditor, treasurer, and other agencies and became as well the central fiscal department of the state by virtue of the budgetary and purchasing functions assigned to it.

The office of Motor Vehicle Controller was created in Mississippi to take over administration of the motor fuel tax, and the motor vehicle privilege taxes and licenses. The law creating the office is notable for its detail with respect to the number of persons to be employed therein, and their salaries and duties.

Changes were made in the internal organizations of the tax departments of Connecticut, Kentucky, and Vermont. These involved chiefly the formation of new divisions or the reallocation of responsibilities within the department.

MUNICIPAL FINANCE

By H. K. Allen

Professor, University of Illinois

The highlights in Municipal Finance for the year 1946 were a further increase in operating expenditures, a continued low-level of tax delinquency, and an increase in new bond issues. The increase in operating expenditures results from the higher cost of materials and supplies and salary increases. The increase in bond issues reflects the launching of postwar public works projects.

EXPENDITURES

The most recent year for which the comprehensive statistics of the Bureau of the Census in final report form are available is 1944.

While some of the absolute expenditures just noted may appear large, yet too great significance should not be attached to them. The size of an expenditure becomes intelligible in terms of service when one discovers the number among whom it is divided. The per capita expenditures of cities, both as a whole and for particular items, have varied greatly from time to time, but the general tendency has been to increase. The latest year for which per capita figures are available is 1942. The following table shows the change in per capita expenditures for selected years:

MUNICIPAL EXPENDITURES

(000 omitted)

Operation and Maintenance, by Major Functions[1]

Year	Total	General Government	Public Safety	Health and Sanitation	Highways
1944	$1,904,844	$163,463	$474,681	$309,147	$139,996
1943	1,873,086	157,393	466,056	282,722	136,008
1942	1,546,634	125,903	358,937	137,228	93,512
1940	2,193,915	168,712	350,462	139,498	108,537
1938	2,167,459	163,089	346,168	136,956	111,979
1936	1,838,803	150,213	317,154	141,207	108,910
1934	1,744,975	135,766	298,758	134,296	111,306
1932	1,806,517	149,909	328,797	160,010	127,670
1929	1,730,288	140,521	339,816	174,858	147,375
1927	1,562,615	136,848	315,362	160,259	137,892
1924	1,287,484	111,856	259,275	130,388	109,807
1922	1,155,691	105,174	234,199	115,488	98,763
1919	697,319	72,585	146,763	75,847	65,003
1915	546,568	62,793	120,696	55,758	60,615
1911	452,899	53,766	106,120	45,691	52,214
1907	367,367	42,703	87,885	36,899	42,718
1903	278,173	30,842	71,020	25,807	34,208

[1] Statistics for 1943 and 1944 are for all cities having a population over 25,000; statistics for 1932 to 1942 are for cities having a population over 100,000. All other data are for cities over 30,000. Because of some changes in the basis of classification, the figures for 1938, 1940, 1942, 1943, and 1944 are not strictly comparable with those for earlier years. In 1943 and 1944, expenditures for hospitals were included with those for health and sanitation. Beginning in 1937, the financial statistics of public-service enterprises were reported separately from those of general government.

Year	Charities, Hospitals, and Corrections	Schools	Libraries	Recreation	Miscellaneous
1944	$204,788	$453,384	$30,226	$74,908	$ 54,251
1943	228,653	454,624	28,635	68,080	50,915
1942	345,841	377,123[1]	21,339	55,737	31,014
1940	500,003	631,432	25,813	65,679	203,779
1938	508,134	625,032	25,519	64,946	185,637
1936	366,466	571,922	21,119	52,303	109,504
1934	345,214	526,864	20,271	48,306	124,194
1932	234,419	629,353	......[1]	63,117	113,242
1929	116,147	622,587	23,029	61,863	94,091
1927	99,806	560,668	20,167	53,839	77,731
1924	79,239	475,725	15,782	41,819	63,590
1922	76,627	422,843	14,326	38,703	49,603
1919	53,262	216,701	9,079	24,204	33,870
1915	38,285	162,332	7,134	20,416	18,535
1911	30,647	127,604	5,939	17,114	13,801
1907	24,408	102,395	4,989	11,794	13,572
1903	18,280	80,853	4,067	7,457	5,634

[1] Expenditures for schools from 1942 to 1944 include those for city corporation only, whereas data for earlier years include independent school districts. Expenditures for libraries and schools were combined in 1932.

IMPORTANCE OF DIFFERENT MUNICIPAL EXPENDITURES

There is a wide difference in the importance attached to the different functions performed by municipalities. While over a period of years there has been some change in the relative importance of some of the items, it is interesting to note that expenditures for education, except for the last three years, were always larger than any other, and that the

1903	13.19	1.46	3.35	1.21	1.64	.86	3.86	.10	.35	.27

* Payments for pensions are included in column "Miscellaneous" for the years 1911 to 1927, inclusive; for the years 1903 to 1909, inclusive, they are included with expenses of police, fire, and school departments.

** Payments for expenses of art galleries and museums are included in column "Recreation" for the years 1911 to 1927 inclusive; for the years 1903 to 1909 inclusive, they are included with the expenses of libraries; expenditures for libraries and schools are combined for the years 1932 and 1934.

relative importance of this item up to 1932 tended to increase with the years. The most significant development in recent years, it will be noted, is the increase in expenditures for public safety. The following table shows the relative importance of the different services over a period of years:

PERCENTAGE OF EXPENDITURES FOR DIFFERENT FUNCTIONS

Year	General Government	Public Safety	Health and Sanitation*	Highways	Charities, Hospitals, and Corrections*	Education		Recreation	Miscellaneous
						Schools*	Libraries*		
1944	8.6	25.0	16.2	7.3	10.8	23.8	1.6	3.9	2.8

* Expenditures for hospitals are included with those for health and sanitation in 1943 and 1944. Percentages for schools and libraries combined for the years 1932 to 1935.

SOURCES OF REVENUE

The revenue of cities arises from a number of sources. In most cities more than 90 per cent of the funds which go into the general revenue fund come from the general property tax. This is a tax levied against real and personal property. In addition to the general property tax, the Census Bureau designates certain taxes as special property taxes. Such include taxes upon the capital stock of corporations, upon savings banks and other financial institutions, and upon insurance companies. Included in this, also, would be taxes levied upon mortgages at time of recording, taxes upon incomes and estates and on investments, and a wide range of specific taxes.

In many cities, also, some form of poll tax continues to be used, although such taxes are much less important than formerly. No generalization can be made as to method of levy since this varies greatly from city to city. In addition, business and non-business license taxes make up a large group of levies upon different types of business activities, some of which, of course, are levied primarily for regulative purposes. The latter include such levies as those upon dogs, dance halls, etc. Receipts from special assessments constitute an important item, but they do not enter the general revenue fund. In some places at a particular time subventions and grants are an important source of income, while in some cities, also, the earnings from public enterprises are not unimportant. The relative importance of major sources of revenue over a period of years is shown in the following table:

PERCENTAGE OF RECEIPTS FROM DIFFERENT SOURCES OF REVENUE

Year	The General Property Tax	Other Taxes and Licenses	Special Assessments	Subventions and Grants, Donations and Pension Assessments	Earnings of Public Service Enterprises[2]	Other Revenues
1944[1]	64.8	9.2	1.1	18.9	....	6.0
1943[1]	66.3	9.2	1.0	17.9	....	5.6

1903	61.4	9.8	7.6	4.3	11.5	5.5

[1] For all cities having population over 25,000. Statistics for 1932 to 1940 are for cities having population over 100,000. For years prior to 1932, data are for cities over 30,000.

[2] Listed separately in years 1937 to 1944.

PER CAPITA TAX BURDEN

That the tax burden imposed by cities has been increasing much more rapidly than population is readily seen when one notes the change in the per capita amounts collected from different sources over a period of years. The latest year for which per capita figures are available is 1942.

MUNICIPAL INDEBTEDNESS

Receipts from sources of revenue may either just pay expenses, more than pay expenses, or fail to pay them. In many cases the administra-

PER CAPITA RECEIPTS FROM DIFFERENT SOURCES

Year	Total	The General Property Tax	Other Taxes and Licenses	Special Assessments	Subventions and Grants, Donations and Pension Assessments	Earnings of Public Service Enterprises[2]	Other Revenues

[1] For all cities having population over 25,000. Statistics for 1932 to 1940 are for cities having population over 100,000. For years prior to 1932, data are for cities over 30,000.

[2] Listed separately in years 1937 to 1942.

tors of the finances have planned for a surplus but because of a shrinkage in revenue have had to resort to borrowing.

In the calculations of the Census Bureau, municipal indebtedness is divided into two distinct groups, long-term obligations and short-term loans. The former includes all obligations which have a number of years to run and for the redemption of which no assets other than a sinking fund or earnings of public-service enterprises have been specifically designated. The latter, on the other hand, includes such indebtedness as is evidenced by warrants, accounts payable, and other short-term obligations. The adjoining table shows the net indebtedness for certain years.

MUNICIPAL INDEBTEDNESS

(000 omitted)

Year	Net Long-Term Debt	
	Amount	Per Capita
1944[1]	$5,379,680	$.....[1]
1943[1]	6,451,536	169.86
1940	6,746,826	177.60
1938	6,470,850	171.23
1936	6,331,516	168.13
1934	6,380,478	169.76
1932	6,289,078	166.66
1930	5,967,563	153.02

1911	1,808,828	67.52
1907	1,808,878	56.04
1903	933,004	44.71

[1] For all cities having population of more than 25,000. Statistics for years 1932 to 1940 are for cities having population over 100,000. For years prior to 1932, data are for cities over 30,000. Per capita figures not available for 1944.

DEVELOPMENTS IN THE BOND MARKET

The aggregate disposals of long-term obligations by municipalities for the first ten months of each year for a series of years are shown in the table on page 269. Total issues for the months covered increased from $641,779,000 in 1944 to $671,251,000 in 1945.

FEDERAL EMERGENCY ADMINISTRATION OF PUBLIC WORKS

The table showing municipal bond issues does not include the extension grants made to municipalities for public-works projects by the Federal Emergency Administration of Public Works. This agency was created by the National Industrial Recovery Act

MUNICIPAL BOND ISSUES

(000 omitted)

Year	Total First Ten Months	Year	Total First Ten Months

which became effective June 16, 1933. Under Title II of this act, authority was granted to the administrator to provide grants, not subject to repayment, for 30 per cent of the total expenditures incurred for the payment of labor and material costs on approved public-works projects. Moreover, the agency was authorized to accept 4 per cent general obligation or revenue bonds of the municipalities as security for the loan portion of the allotment. In 1934, Congress authorized the Reconstruction Finance Corporation to purchase marketable securities from the Public Works Administration and provided that moneys realized by the Public Works Administration from such sales might be used for making additional loans, but not grants, in aid of non-Federal public-works projects under Title II of the National Industrial Recovery Act.

In addition to the program of public works administered under Title II of the National Industrial Recovery Act, the Public Works Administration carried on a separate program pursuant to the Emergency Relief Appropriation Act of 1935. Under the latter act the amount of the grant was fixed by administrative determination at 45 per cent of the cost of the project, with a corresponding reduction in the amount to be furnished by the applicant. Provision was made under this act for the sale of bonds acquired as collateral for municipal loans either on the open market or to the Reconstruction Finance Corporation, the proceeds to be used only for the making of loans. In practice, the sales were confined to the Reconstruction Finance Corporation which, in turn, sold the securities on the open market.

TAX DELINQUENCY

Tax delinquency is a natural phenomenon of a business depression, and a rising trend of tax delinquency inevitably cripples municipal functions and weakens municipal credit. During periods of prosperity, on the other hand, tax delinquency drops sharply. Dun and Bradstreet has made a study of the trend of median year-end tax delinquency in 150 cities over 50,000 population for the 13-year period from 1930 to 1944. The following percentages show the median delinquency on the current tax levy at the end of each fiscal year:

1944	1941	1938	1935	1932
3.90%	6.80%	10.7%	18.0%	19.95%
1943	1940	1937	1934	1931
4.70%	8.70%	11.3%	23.05%	14.60%
1942	1939	1936	1933	1930
6.00%	9.25%	13.9%	26.35%	10.15%

These figures show a substantial gain in collections since 1933; delinquency in 1944 was lower than it was in 1930. Only fragmentary data are available for 1945 and 1946, but it is believed that little change has occurred since 1944.

DEBT DEFAULTS

The *Bond Buyer* estimated, with certain reservations, that 131 cities and towns were in default on their bonds on Dec. 1, 1946. This represents a significant reduction from the previous year when 152 incorporated places were in default. The following states, according to the *Bond Buyer,* had the largest number of defaults:

Florida	43	North Carolina	9
Texas	23	Michigan	5
Pennsylvania	10	Oklahoma	5
Colorado	10	Minnesota	4

It is significant to note that Florida and North Carolina, included in the above group, had large increases in local indebtedness between 1912 and 1932, the percentages being 2,779.01 and 1,300.8, respectively. The indebtedness of Maine during the same period increased only 73.2 per cent, while that of Massachusetts increased only 99.2 per cent. Maine had one incorporated place in default in 1944 and Massachusetts had none. While no data are available regarding the volume of municipal bonds in default, it can reasonably be stated that the volume of such defaults has declined during the past year.

DEBT ADJUSTMENT LEGISLATION

For the purpose of aiding municipalities which are in default on their obligations, various states have recently passed state receivership and debt adjustment acts. Boards or commissions have been established to supervise local indebtedness in general, to supervise the refunding of municipal bonds, and to act as receivers in event of failure to meet debt service.

A Federal Municipal Bankruptcy Act was enacted May 24, 1934. This Act, which was declared unconstitutional by the Supreme Court of the United States in May, 1936, was designed to enable any taxing district, with the consent of its creditors and the approval of a Federal District Court, to adjust its debt structure. According to the *Bond Buyer,* only 27 cities, one county, one school district, 41 irrigation districts, and one road district filed petitions under the Municipal Bankruptcy Act during the two years which the law was in effect.

On Aug. 16, 1937, President Roosevelt signed a new Municipal Bankruptcy Act, designed to replace the original measure which was declared unconstitutional. The present law is similar in its provisions to the invalidated law. It provides a procedure whereby insolvent taxing agencies, such as local drainage, levee, irrigation, road, and sewer districts, as well as towns, boroughs, and municipalities, may effect compositions with their creditors. These compositions are approvable only when the districts or agencies file voluntary proceedings in bankruptcy accompanied by plans approved by 51 per cent of all the creditors of the district or town. The plan of composition can not be confirmed unless accepted in writing by creditors holding at least 66 2/3 per cent of the aggregate amount of the indebtedness of the petitioning district or taxing agency, unless the judge is satisfied that the taxing districts were authorized by law to carry out the plan and there had been a finding by the Court that the plan was fair, equitable, and for the best interests of the creditors. According to Edwin L. Covey, chief of the Bankruptcy Division, Administrative Office of the United States Courts, 266 cases were filed under the 1937 Federal Municipal Bankruptcy Act prior to June 30, 1946. Of this number, 204 cases have been concluded and 62 cases are pending. The aggregate amount of admitted debts in the cases concluded was $181,874,242 and the total amount paid or to be paid is $115,724,808.

FEDERAL INCOME AND PROFITS TAXES

By Mark Carter Mills
Associate Professor, Indiana University

GENERAL

The year 1946 was the first one since 1937 in which there was no Federal income or profits tax legislation. The immediate problems of the transition period were dealt with in the

Tax Adjustment Act of 1945 and in the Revenue Act of 1945. The first made available to corporations for the reconversion period the post-war tax refunds and credits provided by wartime revenue legislation. The far-reaching Revenue Act of 1945 which took effect on Jan. 1, 1946, repealed the excess profits tax and reduced both personal and corporation income taxes. Its other principal features were the repeal of the capital stock tax and of the automobile use tax. At the time of their passage in 1945 these measures were regarded as short-run means of facilitating reconversion and not as having provided solutions of the larger problems of long-range post-war tax revision.

It is noteworthy that there was less public discussion of tax revision in 1946 than in the immediately preceding years and that most of the proposed refinements of existing laws which gained attention during the year originated with the Treasury Department.

CURRENT TAX ISSUES

The objectives to be sought in a thoroughgoing post-war tax revision were set forth by Secretary of the Treasury Vinson in his 1945 Annual Report as follows:

"Broadly stated, our objective is a tax structure with which the taxpayer, the Government, and the national economy can live and prosper.

"The tax structure that taxpayers, both individual and corporate, can best live with will meet the test of fairness by relying on levies based on ability to pay. It will leave the individual adequate incentive to risk his funds in productive enterprise. It will be made up of taxes which are easy to understand and simple and convenient to pay.

"The tax structure that the government can best live with will produce the revenue needed to carry on the functions of government. It will distribute taxes in a manner designed to service the ends of national economic policy. It will be made up of taxes which can be administered fairly and economically.

"The tax structure which the economy can best live and prosper with will rely on those tax measures which strengthen the forces making for a high level of national income and that tend to offset the forces making for instability in our economy."

In spite of differences of opinion between individuals and between groups as to the details of tax revision, there was general agreement upon two points. First, that because of the wartime increase in the national debt and because of the much higher budget level to be expected for many years, tax rates would have to be much higher than in pre-war years. Second, that certain changes made in the tax system during the war years, such as the adoption of the withholding method of collecting taxes on wages and salaries, should be retained. Furthermore, there was general agreement that all tax legislation must be considered in the light of its relation to budget-balancing, its effect upon inflation or deflation and upon the productive efficiency of the nation.

CORPORATION TAXES

Corporation taxes have so much effect upon business that there was much discussion of them during the year both inside and outside of government circles. This was true in spite of the fact that there was much more prospect of a cut in individual income tax rates than there was of any important changes in the corporation taxes.

Although the legislation of 1945 relieved corporations, as such, of all taxes except the regular corporate income tax, the top rates of this tax in 1946 were exactly twice as high as they had been in 1939. The President's Budget Message of January 1946 estimated the yield of the corporation income tax in the fiscal year 1947 at $8,000,000,000.

The major criticism of corporation income taxes has long been that there is an element of "double taxation" when corporation income is taxed at the corporate level and the remaining income is taxed again in the hands of individuals. Whether there is real in-justice in such a procedure depends largely upon whether corporations do in fact shift their taxes.

The most extreme proposal to solve the problem of double taxation has been that of abolishing corporation income taxes altogether. Although it is extremely unlikely that such a solution will be sought in the near future, the loss of revenue to the Government would not be as great as might at first be supposed. Treasury officials have estimated that, at 1946 levels of income and tax rates, the net loss to the Treasury might not be more than $1,000,000,000 if corporation income taxes were abolished and corporate income taxed in the hands of stockholders under the individual income tax. Such a solution would, however, leave unsolved the difficult problem of taxing undistributed profits. It is also extremely unlikely that complete abolition of corporation taxes would be politically feasible.

A suggestion with respect to the taxing of undistributed earnings has been to tax corporations just as partnerships are taxed. The corporation, as such, would not be taxed on its earnings but the stockholders would be taxed on their proportionate shares of the undistributed profits of the corporation. The administrative difficulties involved in taxing the stockholders in large corporations in this manner would seem to be almost insuperable.

Another proposal suggested during 1946 is to adopt the principle of the English method and to administer the corporation tax as a withholding tax. By this method dividend income would be taxed in the hands of the corporation as salaries and wages are now taxed. As in the case of the present withholding tax the stockholder would be given a tax credit for the amount withheld and paid on his behalf by the corporation.

Between those who would drop corporate income taxation altogether and those who would make radical changes in the system are many people both in government and business who would prefer to see the present structure left unchanged with a lowering of rates when and if budgetary considerations made it possible.

FAMILY INCOMES

Aside from the proposals for lower rates and higher exemptions the aspect of the individual income tax most discussed during the year was probably that of the treatment of family incomes. This issue grows out of the fact that in the community-property states where family income may be apportioned between husband and wife there is a possible saving in taxes of as much as 20 per cent among middle-bracket income families which is not possible for citizens in other states.

The issues involved were well described by Stanley S. Surrey, Tax Legislative Counsel of the Treasury Department, in an address delivered before the American Institute of Accountants at Atlantic City Oct. 3, 1946.

"The present treatment of family income is vulnerable to indictment on at least two serious counts. It is a fertile breeding ground of costly, difficult, and wasteful litigation. It is sadly lacking in tax equity, since it involves both geographical discrimination between families in community property states and those in non-community property states, and qualitative discrimination between families receiving earned income and those possessing investment income. These discriminations dollarwise are highly inequitable at present tax rates. Judicial safeguards devised to protect the progressive surtax have not provided a rational system. The alternative legislative solutions to these difficulties are mandatory joint returns or per capita division between husband and wife. At the level of the family, the latter solution of per capita division appears politically feasible. Considered relative to the treatment of single persons, the adoption of the per capita system may perhaps involve some discrimination in favor of the family unit, but the extent of the discrimination so created is difficult of positive proof and measurement. At any event, it does not appear to be as serious as the present admitted inequalities among married couples. The double need of eliminating both these inequalities and the excessive litigation they promote would appear to outweigh the possible claims of single persons. This and other problems, such as the treatment of children and heads of families, together with the effect of per capita division on the revenue yield and the distribution of the income tax burden, will have to be studied before the possibilities of such nationwide income splitting as a solution to the family income problem can be finally determined."

EARNED INCOME

An important feature of the tax simplification program adopted in 1943 was the elimination of the earned income tax credit. At that time it was generally agreed that the provision as it had existed prior to 1943 was more productive of trouble than of revenue. All income up to $3,000 a year was presumed to be earned; all income over $14,000 was presumed to be unearned. In the range between these limits the maximum saving in taxes assignable to the earned income provision was $84 a year. In spite of the faults in the system the differential treatment associated with the earned income concept was defended on the ground of the necessity for special treatment of wage earners and small salary owners who did not have the opportunity to create estates to care for their declining years.

With the high rates of war and post-war periods a demand for special treatment of earned incomes has arisen in connection with executive salaries. It is argued that the high progressive rates in force since the beginning of the war have tended to impair executive efficiency. To a certain extent a high salaried executive is at a disadvantage in comparison with the recipient of an equal amount of property income who may be able to divide his income with his family. However, in view of past experience with the earned income provision and the general relief when it was abolished it seems rather unlikely that it will be revived in any form.

AVERAGING OF INDIVIDUAL INCOMES

Another refinement of the personal income tax suggested by certain Treasury officials during the year was that of applying to individuals the carry-forward privileges that corporations now have. This method of averaging income over a number of years would offer distinct advantages to individuals whose incomes varied widely from year to year and is already applied to a limited extent in the case of lawyers. Averaging would probably be administratively feasible in the case of high-bracket taxpayers but extremely difficult to administer if applied to all taxpayers. Another complication is that personal exemptions change from year to year.

TAX ISSUES IN THE CAMPAIGN

Taxation was not a major issue in the 1946 campaign. It was generally recognized that the possibility of a balanced budget and of lowered taxes depended upon the assumption of a cut in government expenditures and of the maintenance of high levels of business activity, employment, and national income. Some Republican leaders talked during the campaign of a flat 20 per cent cut in all individual income tax rates.

An alternative proposal which received some attention was that of raising personal exemptions. It was estimated by the Treasury that on the basis of existing income levels the decrease in revenue resulting from a 20 per cent cut in individual income tax rates, would be about $4,000,000,000 while each $100 increase in personal exemptions would cost the Treasury around $1,500,000,000 in revenue. Another effect of raising personal exemptions would be to drop an estimated 3,000,000 taxpayers from the rolls if the exemptions were raised from $500 to $600 while nearly 10,000,000 more would be dropped if the exemptions were raised from $600 to $700.

At the year's end it appeared that the most probable action to be taken by the new Congress would be a flat reduction of individual income tax rates, retroactive to Jan. 1, 1947, of perhaps 10 per cent.

IMPORTANCE OF INCOME AND PROFITS TAXES

Total budgetary receipts of the United States Government for the fiscal year 1946 amounted to $44,239,000,000 as compared with $47,740,000,000 in 1945, a decrease of $3,501,000,000. The major importance of income and profits taxes is shown by the fact that receipts from these sources amounted to $35,061,000,000 in 1945 and to $31,258,000,000 in 1946. With the dropping of the corporation excess profits tax in the Revenue Act of 1945 it is to be expected that corporation taxes will decline in relative fiscal importance. The growth in yield of income and profits taxes over a ten-year period is shown in the following table:

INCOME AND PROFITS TAXES 1937-1946

(in thousands of dollars)

Fiscal Year	Total Income and Profits Taxes	Individual	Corporation Income and Excess Profits	Miscellaneous Profits Taxes
1937	2,179,828	1,091,741	1,056,909	31,178
1938	2,629,030	1,286,312	1,299,932	42,786
1939	2,185,114	1,028,834	1,122,541	33,740
1940	2,129,609	982,017	1,120,582	27,010
1941	3,471,124	1,417,655	2,016,297	37,172
1942	8,006,884	3,262,800	4,687,462	56,621
1943	16,298,888	6,629,932	9,584,715	84,241
1944	33,027,802	18,261,005	14,629,344	137,452
1945	35,061,526	19,034,313	15,883,235	143,978
1946	31,258,138	18,704,536	12,462,437	91,165

LAND AND PROPERTY TAXES

By Carol Loucks

New York State Department of Audit and Control

GENERAL

Less than half the legislatures of the states met in regular or special session during 1946. Attention was again directed to state-local fiscal relationships. The Michigan legislature (Senate Concurrent Resolution 4) authorized the creation of a joint special legislative tax committee to inquire into all phases of state and local taxation. In Rhode Island the legislature provided for the creation of a commission which, in addition to reexamining the field of governmental operation, the cost of government services, and the tax structure of the state, is to consider the type and amount of taxes which should be imposed at the state level and distributed to the municipalities (H. B. 877, Laws 1946). The governor of Indiana appointed a tax-study commission whose 30 members are charged, among other matters, with examining the possibility of statewide reassessment of real estate and the place of the state in aiding local units.

The California legislature, meeting in special session this year, created the State School District Emergency Fund (Ch. 134, Laws 1946) which will be apportioned during 1946-1947 to those school districts whose levy is one half cent or less below the maximum established by the Education Code. Ohio (S. B. 362, Laws 1946) increased the allocation to the local government fund from $16,000,000 to $21,000,000.

THE MOORE PLAN OF NEW YORK

The New York State legislature, with the approval of the governor, enacted into law the recommendations of the Commission on Municipal Revenues and the Reduction of Real Estate Taxes. The old system of shared taxes, with revenue yields to localities dependent upon economic conditions and varying inversely according to need, was replaced by The Moore Plan. Under this plan, the state budget is divided into two parts, state purposes and local assistance, and reserve funds have been provided for each of these divisions. From the local assistance fund, payments are made to the localities upon a population basis: $6.75 per capita to cities; $3.55 to towns; and $3.00 to villages. Counties will continue to receive their share of motor vehicle and motor fuel tax revenues. Increases or decreases in revenues of each municipality are limited to ten per cent of the 1944 shared tax receipts each year until the normal per capita allocation is attained or the 1950 Federal census is available.

In accordance with another commission recommendation, the cost to the localities of home relief, aid to dependent children, old age assistance, and aid to the blind has been limited to 20 per cent. The state assumes the difference between the Federal aid received and the remaining 80 per cent.

It is expected that stability of revenues and minimizing the expense subject to greatest fluctuation will assist municipalities in preparing and executing sound financial programs. The tax statements or tax receipts of each municipality must show the amount of local assistance money to be received from the state for that tax year (Ch. 306, Laws 1946).

PAYMENTS IN LIEU OF TAXES

The financial conditions which prompted the formation of the tax study commissions of 1946 and previous years are related to another problem which received the attention of those concerned with property taxation—payment of taxes on property owned by government.

The report of the Committee on Payments in Lieu of Taxes of the National Association of Tax Administrators indicates the scope of this subject. This report recommends that government property, except that used for administration and possibly that used for penal, corrective, and defense purposes, be as subject to taxation as privately owned property. Only when such procedure is not feasible does the report recommend resort to payments in lieu of taxes.

A further recommendation by the committee that surplus property sold by the government for which title is retained pending receipt of the full purchase price should be subject to taxation by local authorities had been given status by the courts at the time the report was made. The Alabama Supreme Court (Ken Realty Co. *v.* State of Alabama) held that property and improvements purchased from the United States Government where legal title is retained by the United States until the full purchase price is paid, is taxable since the transaction gives the purchaser general and beneficial ownership. The United States Supreme Court (S.R.A. Inc. *v.* State of Minnesota) decided that a sale of realty to a taxpayer returned territorial jurisdiction to the state even though title to the property remained with the government until the full purchase price had been paid.

The Kentucky legislature amended the Kentucky Revised Statutes (S. B. 108, Laws 1946) to authorize payments in lieu of taxes by housing authorities. The Massachusetts legislature (Ch. 574, Acts of 1946) granted cities and towns in which housing authority projects are located the right to determine a sum to be paid annually in lieu of the taxation of said property, and, further, amended the General Laws (Ch. 410, Acts of 1946) so that payments in lieu of taxes could be collected by cities and towns from airports for that part of their property used for terminal facilities and administration buildings.

The question of the taxation of property owned by the Government or by government agencies was defined further by another decision of the United States Supreme Court (Reconstruction Finance Company *v.* County of Beaver, Pennsylvania). In this case the Court held that the extent to which real property was taxable under the Reconstruction Finance Corporation Act was governed by local law in each state since Congress had made no uniform provision in the law.

EXEMPTIONS

Veterans exemptions were again an important consideration in 1946. California (Ch. 120, Laws 1946) amended the Revenue and Taxation Code to include veterans of the Second World War in the exemption from property taxes and (Ch. 85 Laws 1946) provided that from Sept. 16, 1940 or, if subsequent to that date, from time of entry into the armed services until six months after honorable separation from service, property in which a veteran has at least 50 per cent ownership shall not be subject to fines, penalties, or costs. New Jersey extended its property tax exemption (Ch. 212, Laws 1946) to include veterans of the Second World War. The Michigan legislature during its special session revised its laws governing homestead exemption to veterans (Public Acts Oct. 24, 1946). In this connection the attorney general ruled that a serviceman is entitled to a refund of taxes paid after Dec. 31, 1939 providing the taxes for those years are paid after entering the service regardless of the time elapsed after the taxes became due and before entry into the service (Opinion, Attorney General to Auditor-General, March 27, 1946). For certain veterans and their wives, Massachusetts extended the property tax exemptions to $8,000 (Ch. 579, Acts 1946). New York state amended and added to its veterans exemption privileges so that real property purchased with the proceeds of pensions, bonuses, or insurance shall be exempt from taxes for the construction and maintenance of streets and highways (Ch. 86 Laws 1946); property purchased by popular subscription as appreciation of extraordinary service of a permanently injured war veteran was exempted from taxation up to the value of $5,000 (Ch. 139, Laws 1946); and the exemptions granted to a veteran were extended to include property held by his minor children (Ch. 556, Laws 1946).

The impact of these veterans exemptions is a matter of grave concern to tax authorities. Connecticut officials have estimated that the towns of the state will have to increase their rate from a fraction of a mill to approximately four mills to compensate for the loss in tax dollars due to veterans property tax exemptions. In California, Second World War veterans hold a potential $800,000,000 of exemption privileges.

The District of Columbia exempted from taxation property transferred to the American Red Cross (P. L. 433, Laws 1946). Mississippi granted all nonprofit, cooperative electric power associations exemption from *ad valorem* taxes (H. B. 563, Laws 1946) but the exemption does not include municipal *ad valorem* taxes on real estate owned by such corporations.

The South Carolina legislature submitted to the voters (S.J.R. 870) an amendment to the constitution empowering the General Assembly to exempt new manufacturing and industrial establishments in Chesterfield County from all local municipal, county, and special taxes for not more than ten years. South Carolina will also submit to the qualified electors an amendment to the constitution (H.J.R. 245 permitting the General Assembly to exempt household goods and furniture used in the home of the owner from taxation.

On the other side of the exemption picture, Mississippi (H. B. 487, Laws 1946) amended the Mississippi Code by deleting property belonging to the United States from the list of property exempt from *ad valorem* taxation. The Ohio Board of Tax Appeals (application of the City of Marion, O., No. 11568, June 4, 1946) ruled that a tract of land purchased by a city to be used and converted into an airport is not exempt from taxation when, as of tax listing day, only a certain portion of engineering work has been accomplished even when the purchase of such property was financed by a bond issue voted for the purpose of establishing an airport and the city retains exclusive ownership and control.

LEVIES

A direct annual tax on property, cigarettes, and pari-mutuel betting was enacted by the special session of the Illinois legislature to pay the interest and principal on bonds issued for the Service Recognition Bond, Interest and Retirement Fund (S. B. 1, Laws 1946). This tax was made subject to a vote of the people in November and, previous to the election, was declared constitutional by the Circuit Court of Appeals of Cook County (Routt *et al.* *v.* Barrett *et al.*). The legislatures of California (Ch. 110, Laws 1946), Kentucky (H. B. 491, Laws 1946), and Louisiana (Act 86, Laws 1946) authorized special levies on real property to construct and maintain war memorials.

Additional levies for educational purposes were enacted. Mississippi authorized (S. B. 200, Laws 1946) county boards of supervisors to levy a two-mill tax on all property outside separate school districts to build, equip, and repair schoolhouses, and (H. B. 310, Laws 1946) allowed counties to impose a tax of one-half mill for library purposes, which tax is outside any limitation on county levies. Wyoming increased the maximum levy for school districts maintaining high schools of certain standards or providing their pupils with means to attend such high schools (H. B. 5, Laws 1946). Kentucky (S. B. 61, Laws 1946) provided for an annual levy of not to exceed five mills to establish junior colleges in counties containing a city of the fourth class. The limitation on levies for the purposes of municipal universities was increased by the Ohio legislature (S. B. 306, Laws 1946).

Subject to the approval of the qualified voters within the area affected, the Mississippi legislature authorized municipalities with a population of less than 1,000 to levy an *ad valorem* tax of two mills for the maintenance and construction of streets. Wyoming permitted a two-mill tax for the construction and maintenance of improved all-weather roads (S. B. 8, Laws 1946) and excluded this tax from the prescribed maximum levies.

Machinery for financing particular local needs was provided during some legislative sessions. Mississippi voters may approve a two-mill *ad valorem* levy for cemetery upkeep and maintenance (H. B. 806, Laws 1946). In the same state, municipalities received authority to levy a tax not to exceed one-half mill for the construction and maintenance of parks, playgrounds, and other recreational facilities (H. B. 701, Laws 1946). In Louisiana, airport districts may be created if the electors approve, and these districts may be financed for a period of no more than ten years by a levy of not to exceed five mills each year (Act 364, Laws 1946).

The Louisiana legislation met more specific needs when it authorized the creation of the Lafayette Harbor and Terminal District to be financed by a levy of not more than two and one-half mills on property within the district (Act 14, Laws 1946); the Recreation and Park Commission of East Baton Rouge Parish with power to levy a one-mill tax (Act 246, Laws 1946); and the Jennings Navigation District which also has the power to levy a one-mill tax (Act 254, Laws 1946).

TAXATION OF THE RIGHT TO INSURANCE INCOME

Kentucky clarified its laws with respect to property taxation of the right to receive income from the proceeds of life insurance policies (H. B. 128, Laws 1946). The measure of the tax is now the assessed valuation of this right based upon an estimate of its worth in a voluntary sale instead of the former base of the expected proceeds based upon a mortality table. The rate of the tax is limited to five cents per $100 of valuation.

CORPORATION AND BANK TAXES

By Chester B. Pond
New York State Department of Taxation and Finance

FEDERAL TAXATION

After the passage of the Revenue Act of 1945 in December of that year no legislation affecting the taxation of corporations was enacted during the session of Congress in 1946. Activity in the Federal area was limited to decisions of the courts and rulings by the Commissioner of Internal Revenue. It might be noted that these findings were very largely of a special case nature rather than matters of wide applicability.

Through the Department of State several tax treaties were negotiated, the most notable being with the United Kingdom and France. These conventions dealt largely with the avoidance of double corporate taxation on certain operations and the application of the tax on other operations at a reduced rate. Immunity from taxation was also granted the numerous international organizations which have been established in conjunction with the United Nations and through the efforts of the Department of State.

STATE CORPORATION TAXES

General.—State activity in the corporate tax field was also relatively light in 1946, with only a small number of state legislatures in session, but the first signs of post-war revenue hunting became apparent. Several of the states adjusted their administrative machinery, revised existing statutes, or completely rewrote their corporate tax laws.

Municipalities.—Perhaps most significant of the year's developments was the further extension of jurisdiction in the income tax field to municipalities. St. Louis and Toledo were the newcomers, the former levying a ¼ of 1 per cent net profits tax on resident and nonresident corporations, and the latter, a 1 per cent net profits tax on resident corporations to the extent that such income is derived from local activities. New York City was granted a continuation of its tax on gross receipts or operating revenue of utilities. Los Angeles enacted a gross receipts tax upon the manufacture and sale of goods at wholesale.

New York.—A number of changes was made in the tax laws affecting corporations. Outstanding was the return from the emergency rate of 6 per cent to the normal 4½ per cent in the franchise tax on domestic and foreign corporations, the reduction being applicable to any business year ending after June 30, 1945. According to another 1946 statute, foreign corporations, whose sole activity within the state consists of retaining securities there for safekeeping, are not considered to be doing business within the state. Several other measures relative to the franchise tax made minor changes in the computation of the tax. Deductions from investment capital of any short term liabilities applying to it are permitted, as are deductions from business capital of capital liabilities not already deducted from investment capital. Corporations which had previously filed consolidated reports must now file combined reports, and the tax payable is computed on the combined entire net income or capital of all corporations listed in the report. Thus, intercorporate items for tax computation purposes are eliminated. The state temporary 2 per cent tax on utilities is continued to March 31, 1947, and the right of cities to levy a 1 per cent utilities tax is extended to June 30, 1947.

Massachusetts.—Further bonuses for veterans are to be financed by an additional 1½ per cent tax on the net income of domestic and foreign manufacturing and business corporations (except corporations dealing in securities as principals) for the years 1947 to 1950. This act replaces the 2½ per cent tax applicable to 1946 but is in addition to the 10 per cent and 3 per cent surtaxes. The state has also instituted a 5 per cent tax on the underwriting profits of marine, and fire and marine insurance companies, in place of the gross premiums tax applicable to other forms of insurance companies.

Missouri.—The extensive alterations in the corporation tax laws made in 1946 are largely with respect to administration. The franchise tax due date has been advanced from May 15 to Dec. 31. All collection functions in conjunction with the organization and franchise taxes were centralized in the office of the Director of Revenue. The major part of the law relating to the taxation of insurance companies were rewritten without significant change other than transferring the collection activities to the Director of Revenue. A new enactment provides that the tax on domestic, life and accident, mutual other than life, and title insurance companies is in lieu of the tax on intangibles. The present utilities tax was re-enacted without material change.

Mississippi.—The premium tax on domestic and foreign insurance companies was equalized by providing that domestic companies pay the entire difference (rather than one-half as heretofore) between their *ad valorem* tax and the tax on foreign companies doing the same business.

Louisiana.—The franchise tax was amended to a considerable extent, chiefly by lowering the rate from $2 to $1.50 per $1,000; elimination of distinction between domestic and foreign corporations; inclusion in the tax base of all borrowed capital and certain reserves; exclusion of certain amounts for taxes, interest, advance business payments, and surpluses set aside by court order; redefinition of borrowed capital so as to include only indebtedness maturing at least one year after incurrence; introduction of a net sales formula, and a plan for allocating subsidiary income. For the state income tax, corporations are now allowed a deduction for contributions up to a maximum of 5 per cent of net income. Domestic corporations are granted a credit for income taxes paid to another state on income taxable by Louisiana. Another 1946 statute provides that dividends distributed shall be considered as taken from the latest accumulated earnings of a corporation rather than the earliest earnings as in the past. In the taxation of insurance companies' premiums the stock of homestead building and loan associations organized under Louisiana laws and insured by a Federal or state agency may now be included among investments deductible in the computation of the tax.

Kentucky.—The organization and qualification fee schedule for domestic and foreign corporations was revised upward with a classified and graduated scale of rates replacing the former flat rate. Recording and filing fees were similarly revised.

BANK TAXATION

Louisiana.—The existing tax on bank shares was repealed and a new measure was enacted which is substantially the same as the old except that bank shares are now classified, and state and national bank shares are taxed at 50 per cent of assessed valuation. Other provisions deal with the date of filing lists of shareholders and all real estate owned by banks or their subsidiaries.

Missouri.—A 7 per cent net income tax upon banking institutions was enacted in lieu of the bank share and combined property taxes formerly levied. In line with the general centralization of functions the tax will be administered by the Department of Revenue.

New Jersey.—Financial businesses

employing moneyed capital for profit and in competition with national banks became the subject of a new tax replacing the state franchise tax or other state or local taxes based on personal property. Such corporate taxpayers are liable for the year 1946 under this tax or the corporation business tax, whichever is greater. Any tax paid under the latter act may be credited against taxes due under this act. Hereafter, penalties on taxes levied for county purposes shall be applicable to the bank share tax, which is now payable semi-annually.

New York.—Banks are granted a deduction in computing net income to the extent of contributions made toward employees' pension trusts if the amount has not previously been allowed or is apportioned over 10 years or covers not more than one-tenth of the total pension liability with respect to services prior to such taxable year.

Virginia.—Any city regardless of population and any town in which the branch of a city bank is located may now impose a tax on bank stock not exceeding 40 per cent of the state tax rate.

JUDICIAL REVIEW

Litigation in the field in 1946 dealt largely with the determination and apportionment of net income. In February, the Oklahoma Supreme Court in *Oklahoma—Texas Trust* v. *Oklahoma Tax Commission* held that a business trust was taxable as a corporation. Disallowance of credit for accrued expenses was held valid by the Tennessee Supreme Court in *Southern Coal Company, Inc.* v. *McCanless.* The Vermont Supreme Court ruled that Federal excess profits taxes were deductible in computing the Vermont franchise tax in the period before excess profits income became a credit in 1942, and that a refund may be issued by Vermont in cases where Federal renegotiation has reduced taxable income (*Fairbanks Morse and Company* v. *Harvey*).

In July, the Minnesota Board of Tax Appeals decided that the packaging of butter may not be deemed manufacturing within the meaning of the income and franchise tax law (*Sugar Creek Creamery Co.* v. *The Commissioner of Taxation*). The taxation of insurance companies came up for review on several occasions during the year and in the two most important cases, *Prudential Insurance Co.* v. *Benjamin* and *Robertson* v. *California,* the U. S. Supreme Court sustained the right of states to tax this source and in so doing to distinguish between domestic and foreign companies.

The U. S. Supreme Court in June rendered a *per curiam* decision affirming the California Supreme Court ruling in *West Publishing Company* v. *McColgan.* It was clearly established that a state may tax a foreign corporation engaged exclusively in interstate commerce on that portion of its net income derived from sources within the state, despite the fact that the corporation has no regular place of business in the usual sense. Essentially the same type of law in Minnesota was validated in September by the Minnesota Board of Tax Appeals in *Owens-Illinois Glass Company* v. *The Commissioner of Taxation.*

ESTATE AND INHERITANCE TAXES

By Mortimer M. Kassell

Deputy Commissioner and Counsel, New York State Tax Commission

DEATH TAX CONVENTIONS

The growing tendency to provide for the elimination of multiple death taxes by international agreement was reflected by the signing of a Tax Convention by the United States and France at Paris on Oct. 18, 1946, which will take effect upon exchange of ratifications. The United States-United Kingdom Death Tax Convention, signed April 16, 1945, became operative on exchange of instruments of ratification at Washington, D. C. on July 25, 1946. Negotiations for similar conventions with the Philippines, Denmark, the Netherlands, and the Union of South Africa, are pending.

STATE TAXATION

Because most state legislatures were not in session, there were few important amendments made to state death tax laws. The Congress exempted from the District of Columbia inheritance tax transfers made to the American National Red Cross (Public Law 430, 79th Cong., 2d Sess.). Massachusetts provided for the payment of death taxes upon the settlement of the estates of absentees (Ch. 395). New Jersey provided that interest shall not be chargeable, with respect to the inheritance tax in the estate of a deceased member of the armed forces, until one year after official notification of death (Ch. 70), and limited the lien for inheritance taxes to two years after July 1, 1946 or ten years after the date of death, whichever is later (Ch. 240). New York provided for the inclusion in the gross estate of property with respect to which the decedent possessed a power of appointment at his death, or with respect to which he had exercised or released a power in contemplation of, or to take effect at, death, effective May 1, 1947 (Ch. 858), that exemptions are allowable only with respect to transfers which are indefeasibly vested (Ch. 380), for the collection of interest on unpaid additional estate taxes from the date of the final Federal estate tax determination (Ch. 694), and for a limitation of time to collect transfer taxes (Ch. 558). South Carolina provided for the reciprocal exemption of charitable transfers to residents, and entities organized under the laws, of other states (Act 547). Virginia provided for the apportionment of Federal and state estate taxes in the absence of a contrary provision in the decedent's will (Ch. 128), and for the apportionment of non-residents' exemptions (Ch. 215).

FEDERAL TAXATION

In the field of Federal estate taxation, the time for tax-free releases of powers of appointment was extended to July 1, 1947 (House Joint Resolution 353).

A group of decisions by several United States Circuit Courts of Appeal, and amendments made by the United States Treasury Department to Section 81.17 of Regulations 105 (T.D. 5512, 1946-1 CB 264), interpreted the holdings of the United States Supreme Court in *Helvering v. Hallock* (309 U.S. 106), *Fidelity-Philadelphia Trust Co. v. Rothensies* (324 U.S. 108), *Commissioner of Internal Revenue v. Estate of Field* (324 U.S. 113), and *Goldstone v. United States* (325 U.S. 687), relating to the taxation of transfers with the retention of a possibility of reverter. The amendments to Regulations 105 provided that a transfer of an interest in property by a decedent during his life is taxable if possession or enjoyment of the transferred interest can be obtained only by beneficiaries who must survive the decedent, and the decedent or his estate possesses any right or interest in the property, whether arising by the express terms of the instrument of transfer or otherwise. In the Circuit Court cases, it was held that the remoteness of the possibility of reverter, or the fact that the possibility arises by operation of law, does not affect the taxability of the transfer. (*Commissioner of Internal Revenue v. Bank of California* (CCA-9), 155 F. 2d 1, cert. den. October 14, 1946; *Commissioner of Internal Revenue v. Bayne's Estate* (CCA-2), 155 F. 2d 475; *Thomas v. Graham* (CCA-5), December 12, 1946; *Commissioner of Internal Revenue v. Spiegel's Estate* (CCA-7), December 28, 1946.)

In *Commissioner v. Estate of Holmes* (326 U.S. 480), the Supreme Court held that a transfer in trust made by a decedent on January 20, 1935, reserving a power to terminate the trust, is a transfer with the reservation of a power to alter, amend or revoke, within the meaning of section 811(d)(2) of the Internal Revenue Code.

In *Allen v. Trust Company* (326 U.S. 630), the Supreme Court reaffirmed the principle that a transfer is made in contemplation of death if the thought of death is the "impelling cause of the transfer," but held that, on the facts before it, the release by decedent, within two years of his death in 1938, of a power to amend transfers in trust made by him in 1925, was not a transfer in contemplation of death for Federal estate tax purposes.

AUTOMOBILE TAXES

By Mildred F. Guffin

New York State Department of Taxation and Finance

LEGISLATION AND COLLECTIONS

The shadow of the war still lies over automobile tax legislation and collections, though it has begun to recede. The Federal automobile use tax lapsed on July 1, 1946, and was not renewed. Special Federal war emergency excise taxes on gasoline, lubricating oil, and pipe lines remain in effect. Receipts from them during the first six months of 1946 dropped to $269,000,000, a loss of 15 per cent from $318,000,000 in 1945.

State revenues from gasoline taxes began to rise in 1945 and are continuing. Total motor fuel tax collections in 1945 were almost $850,000.000, an increase of nearly 14 per cent over 1944, and collections for the first eight months of 1946 were over $725,000,000, an increase of 39 per cent over the $522,000,000 collected in the same period in 1945. The end of gasoline and tire rationing is chiefly responsible for this trend, though higher tax rates have a small part.

On the basis of government data, certain oil interests forecast an increasing average annual gasoline consumption, at a rate of 680 gallons of gasoline per passenger car for 1946, 685 gallons for 1947, and over 730 gallons in 1950. Motor vehicle licenses brought in state tax receipts of $456,000,000 during the fiscal year ended June 30, 1946, as contrasted with $414,000,000 in fiscal 1945. Over 1,000,000 more cars were registered in the first half of 1946 than in the corresponding period of 1945.

MOTOR FUEL TAXES

Less than half of the state legislatures held sessions in 1946, and motor fuel tax legislation was not extensive. Virginia and Mississippi were the only states to raise their basic rates. Mississippi kept the existing rate of six cents per gallon on gasoline but increased the rate on motor fuel other than gasoline from six to seven cents per gallon. Virginia raised the gasoline and use-fuel tax rates from five to six cents per gallon. South Carolina re-enacted its motor fuel tax without change, and New York extended its emergency taxes to March 3, 1947.

Six southern states have permitted increases in refunds. Virginia added a month to the period allowed for filing claims. Kentucky and Georgia authorized refunds of a major part of the taxes collected on gasoline used in farm equipment. Mississippi will refund five cents of the six-cent gasoline tax paid for fuel used in municipally owned equipment. South Carolina added gasoline used in training aviation students from allied nations to its list of fuel subject to refunds, retroactive to July 1, 1941.

Mississippi reorganized its administration, created the office of Motor Vehicle Comptroller, and gave to the new office the administration of motor fuel and use-fuel taxes, and the power of making reciprocal agreements with other states. A new Louisiana law confines use by New Orleans of the special fund from the parish-aid gasoline tax to streets and bridges. In the November elections, Louisiana voters adopted two constitutional amendments, one taxing all gasoline sold to the Federal Government except that delivered in lots of 6,000 gallons or more, or to the armed forces, the second exempting tractor fuel from taxation. In North Dakota the voters approved an initiative petition providing for the refund of the tax on motor fuel used for agricultural or industrial purposes.

MOTOR VEHICLE LICENSES

There was more legislation in 1946 concerning motor vehicles than motor fuel. Georgia instituted new schedules of taxes on truck trailers and semi-trailers, which are much lower for lighter vehicles. In connection with the taxation of trailers in Florida, a 1946 ruling of the Attorney General states that trailers may be classified for taxation either as motor vehicles, as personal property, or as real estate, depending on their use. Only those attached to utility lines and set up on foundations may be taxed as real estate.

Mississippi has completely revised registration and privilege license fees for motor vehicle operators, lowering nearly all fees. Operators of motor vehicles using fuels other than gasoline on which no tax has been paid must pay annual license fees of $50 or $100, based on the gross weight of the vehicles. Fees for passenger carriers are based on a percentage of the gross revenues, instead of seating capacity. Mileage taxes, previously graduated according to the carrying capacity of the vehicles, now correspond to a mileage rate depending on the classification of the vehicles. Inspection fees for all kinds of carriers have been slightly lowered. A new law authorizes reciprocal agreements with other states to relieve truck operators. The first agreement under this law was made with Tennessee in April. Neither state will tax trucks licensed in the other state.

On Jan. 1, 1947, Kentucky had three new truck taxes, graduated by gross weight, instead of the one former tax, based on capacity. All trucks will pay one basic tax; property carriers will pay a second; and non-property carriers a third. Trucks not equipped with pneumatic tires continue to pay an additional 50 per cent of their other fees.

The Louisiana law has been extensively revised. Length limits were established for buses, and length limits for trucks, tractors, and semi-trailers were increased from 45 to 50 feet. Weight limits were set for trucks and trailers. A more stringent penalty for operating vehicles in excess of the registered weight was enacted.

New Jersey generally increased its fees. Certificates of ownership now required cost more than the former certificates of title, and the automobile dealers' license fee is now much higher. Registration fees for heavier commercial vehicles, trailers, and tractors will run much higher, effective April 1, 1947. The increased truck fees, advocated by Governor Edge in his annual message, aroused great opposition, which was effective in lowering the rates of the original bill, and postponing its effective date far into 1947.

Common carriers in Rhode Island, too, must pay more for their certificates or permits and license plates. Virginia, reversing the trend toward increases, has reduced its minimum motor vehicle registration fee, and the fees for dealers' registration, for additional license plates, for registration of private motor vehicles used to transport non-paying passengers, and contract school buses. As of April 15, 1947, the gross receipts tax was discontinued on common and contract carriers. New fees based on gross weight will take its place. Carriers operating fewer than three vehicles with not more than $5,000 gross receipts are exempt from the new law.

The General Assembly of South Carolina passed an interesting provision requiring the State Highway Department to refuse licenses for motor vehicles on which state or local taxes had not been paid. Automobile dealers secured a temporary, and then a permanent, injunction, restraining the Highway Department from refusing licenses. Latest word from South Carolina was that the Highway Department was obeying the injunction, but had served a notice of appeal to the Supreme Court.

OPERATOR'S LICENSES

Effective July 31, 1946, Louisiana began to require licenses for operators and chauffeurs. The biennial fee for operators is $1.00 everywhere except in cities of more than 300,000 population, where it is $2.00. The corresponding fees for chauffeurs are $3.00 and $5.00. All persons except farmers and drivers of government vehicles are required to obtain licenses, within 11 months of the effective date of the law, and provision is made for testing applicants. Nonresidents may operate within the state for 60 days without a license. A basis for reciprocal regulation of licenses with other states has been established.

The Indiana Bureau of Motor Vehicles, on Jan. 1, 1946, began licensing operators for two-year periods. The new expiration date will always be the last day of February in even numbered years.

Mississippi now requires all drivers of commercial vehicles to pay the chauffeur's license fee, in addition to the operator's license fee, which was doubled in 1946.

In Virginia all new or renewal operator's licenses issued after July 1, 1946 will expire three years from the birthday month of the applicant nearest to the month in which the application for license is made. Licenses will be valid for three years and must thereafter be renewed in the applicant's birthday month. Provisions regarding chauffeur's licenses have not been changed.

FINANCIAL RESPONSIBILITY

Two more states have been added to the list of those which require motorists to prove financial responsibility in case of accident. By provisions of the Kentucky law, effective Jan. 1, 1947, the operator of every motor vehicle involved in an accident in which any person is killed or injured, or property damage of over $50 occurs, must render a report. Operators must prove financial responsibility either by carrying liability insurance or by posting bond. Drivers who do not satisfy these requirements may have their licenses suspended or revoked. The law applies to non-residents as well as residents.

The effective date of the new Missouri law was 90 days after July 8, 1946. The law is similar to the Kentucky law, providing for suspension or revocation of the driver's license and the car registration upon conviction of an offense. Non-residents are subject to its provisions.

PUBLIC RESOURCES AND UTILITIES

FEDERAL SURVEYS AND MAPS

By C. F. Fuechsel

Chief, Map Information Office, U. S. Geological Survey

GENERAL

During 1946 the Federal surveying and mapping agencies completed their readjustment to peacetime objectives and clarified their respective programs for the immediate future. Practically all agencies with substantial survey and map-making capacities had, since 1941, devoted the greater part of their organizations to projects required by the War and Navy Departments, and not all of such assignments were brought to a close with the termination of the war. The global aspects and air power of the Second World War brought a realization that the world-at-large was less than 25 per cent mapped, even in sufficient detail for the meager requirements of aeronautical pilotage charts. This situation was very considerably improved during the war but much work remains to be accomplished during the next decade, particularly in view of the potential speed and power of any military operations which might arise in the future. Projects carried by civilian agencies for the military have, therefore, not all been terminated, and the few which have been continued now assume more or less long-term aspects. This, in turn, has enabled the agencies concerned to adjust their organizations to cover substantially their normal responsibilities as well.

Great advances in mapping techniques, instruments, and procedures were realized during 1946. Many of the forward steps brought by the exigencies of war, such as the development of the trimetrogon process of mapping and electronic devices for air navigation, were brought to still more advanced stages during 1946. The terrain clearance indicator and the various elements of Shoran equipment now show great promise of practicable application to geodetic, hydrographic, and reconnaissance topographic surveys in the reasonably near future. Electronics are already extensively employed in geophysical explorations.

For the first time in our history the nation has become actively map conscious. Broad development programs, such as those contemplated for the Missouri, Columbia, and other river basins covering the entire West, and myriad planning and engineering projects involving the rest of the country, have combined with the map-consciousness engendered by a global war to effect a general demand that the basic map status of the United States be immediately improved. In recognition of these urgent requirements the Geological Survey has presented a national mapping program to the Congress for completion of the topographic map of the country during the next 20 years. At the rate of previous accomplishments this task would not be completed for more than a century.

Barely half the continental United States is topographically mapped in some manner and only a quarter of the country is covered by maps of sufficient detail to meet present-day requirements. Most of the other leading nations have complete series of topographic maps which are maintained in up-to-date status.

SURVEYING AND MAPPING AGENCIES

The surveying and map compilation projects of the Federal Government cover a very broad scope of endeavor and include geodetic, geologic, hydrographic, topographic, cadastral, soil, and many other types of surveys as well as map compilation involving innumerable subjects and purposes.

The activities of the several Federal surveying and mapping agencies are coordinated by the Bureau of the Budget, thus eliminating duplication of effort and promoting over-all efficiency of operations. Functions of the former Federal Board of Surveys and Maps were transferred to the Bureau in 1942 for this purpose. Cost accounting and reporting procedures have since been established whereby the over-all mapping requirements of the various Federal agencies may be determined and operations scheduled on a priority-of-needs basis, and relative costs and efficiencies of the several producing organizations may be compared. The Bureau also encourages the study of new methods and instruments and adoption of the most efficient and economical procedures of surveying and mapping currently available.

The accomplishments of the various producing agencies, as well as those mainly concerned with map research and the maintenance of important map libraries, are presented in the following statements. They have been arranged in alphabetical order, on an agency basis, rather than by departmental groupings. If not an independent bureau, the department affiliation is indicated after the agency name with capital letter in parentheses, thus: (A)-Agriculture; (I)-Interior; etc.

AERONAUTICAL CHART SERVICE (W)

The Aeronautical Chart Service of the Army Air Forces is responsible for the production, procurement, and distribution of all maps, charts, and related publications required by the Army Air Forces. These charts are made available to civil aviation and others requiring small-scale data.

During the first post-war year the Service has been engaged primarily in converting from war to peacetime operations. Of about 7,000 charts produced during the war, approximately 3,600 charts of all types will be maintained in peacetime. To accomplish this a schedule has been set up whereby all aeronautical charts will receive a periodic inspection and each will then be brought up-to-date, using the latest data available for the particular area. As a peacetime practice, greater use will be made of aerial photography as source material from which to compile and revise aeronautical charts. In addition to the 12,500,000 square miles of aerial photography accomplished during the war, 296,700 square miles of aerial photography has been accomplished during 1946.

New developments in cartographic techniques and efforts in standardizing charting work have resulted in: A. A series of aeronautical charts being produced depicting terrain by shaded relief in various tones of gray which closely approximates the view seen on a radar scope. B. Air Coordinating Committee adoption of standard aeronautical symbols for use by all charting agencies. C. A new type of specification produced that includes a full-colored example of each charting characteristic described. D. ACC standardization of Instrument Approach and Landing Charts. The Aeronautical Chart Service has adopted a twenty-one (21) post loose leaf binder for Pilot's Handbooks which are made up to include Instrument Approach and Landing Charts of a given area.

The Aeronautical Chart Service is continuing chart development and experimental work constantly to improve the standards and procedures pertaining to the compilation and production of aeronautical charts.

ARMY MAP SERVICE (C. OF E.) (W)

The Army Map Service, through the Corps of Engineers, is responsible for providing maps needed by the War Department. During periods of hostilities this responsibility is divided between the Map Service and the several theater commanders working under a coordinated program, and includes the preparation of maps, especially of foreign areas, map reproduction, the maintenance of a complete map library, and investigation of new and improved cartographic and reproduction techniques. In domestic areas where suitable maps do not exist, the function of providing them is also a part of the responsibility.

During the past year 2,915 new and revised maps were prepared, over 64,000,000 copies were printed from 6,916 basic maps, and preparation had been started on about another 5,000 basic maps. The library acquired about 196,000 new maps and over 5,000 books and documents in addition to thousands of items which have not as yet been classified. It now has a total holding of over 800,000 maps, books, and documents.

The post-war activities of the Army Map Service are an expansion of the library facilities to include topographic maps, geodetic data, and related mapping intelligence which could serve as compilation source material for War Department maps, the preparation of a series of strategic and planning maps of many foreign and some domestic areas at scales of 1:250,000 and 1:1,000,000, and the mapping of military posts, camps, and stations at large scales. As an addenda to regular mapping a Relief Map Section prepares relief models and investigates suitability of plastic, rubber, or other similar materials for this purpose.

Through a depository program recently inaugurated, copies of the Map Service library holdings may be found in many local and university libraries in this country.

BOARD ON GEOGRAPHICAL NAMES (I)

The Board on Geographical Names rendered a total of 2,500 name decisions, including 35 on domestic names. A transliteration system for treatment of Arabic and Persian names, and a transcription system for the treatment of Mongolian names, were devised and approved. The foreign name files of the Board were increased by the processing of large numbers of names for government maps and reports, and the receipt of processed names from government mapping agencies. Over 3,000 mail and telephone requests for place-name information were answered, and over 15,000 copies of technical bulletins and decision lists were distributed to the various users of the Board's findings. Directions for the treatment of geographical names were published for 10 areas in Latin America, and preliminary examination was completed for 20 other areas. Steps were taken to facilitate active cooperation between the Board and its counterparts in foreign countries.

BUREAU OF LAND MANAGEMENT (I)

The Bureau of Land Management (formerly General Land Office) executes cadastral surveys within the area of the public domain and publishes state maps of the several public land states as well as the official wall map of the United States.

During the year, cadastral engineering activities were carried on in 22 states and the Territory of Alaska. This work involved the survey and resurvey of 1,125,557 acres, in addition to cadastral field investigations and miscellaneous projects not measurable on a quantity basis. These surveys are represented on a total of 252 cadastral plats which were prepared in final form for the permanent record.

During the year, work was initiated on an extensive program of cadastral surveys and resurveys in the Missouri River Basin within Montana, Wyoming, and the Dakotas in connection with the development of that area. The project contemplates the resurvey of approximately 450 townships within the Missouri River Basin and the recovery and monumentation of public survey corners in numerous townships along the Little Missouri, Powder, Cheyenne, and Moreau rivers. In addition to defining land boundaries, these surveys afford control for extension of topographic mapping within the Missouri River Basin.

Cadastral survey and resurveys were also executed on other large areas in the western public land states for administration and management of the public domain.

During the year, the map of the State of California was completed and work was commenced on the revision of the map of the State of Wyoming. A reprint of the official wall map of the United States with certain revisions is in progress.

BUREAU OF RECLAMATION (I)

The Bureau of Reclamation is not a primary map-making agency and undertakes to contract for such work or to perform such operations only when existing maps of suitable quality are not available, and primary map-making agencies can not undertake to prepare suitable maps by the time needed, or when the mapping is a specialized type peculiar to Bureau needs.

The Bureau, in carrying out its responsibilities for development of the water resources of the West, uses numerous topographic maps of the Geological Survey and in cooperation with the Survey finances the preparation of such maps in areas when immediate needs require higher priority work than the normal demands on the Geological Survey would permit. In addition, the Bureau, using specifications approved by the Survey, lets contracts for maps in areas urgently needed for carrying out irrigation projects. During 1946 contracts were advertised or let by the Bureau for photography, photo mosaics, and topographic maps at various scales from 1:2,400 to 1:24,000 in areas totaling more than 27,000 square miles in California, Utah, Montana, Wyoming, and South Dakota.

COAST AND GEODETIC SURVEY (C)

In 1946 this agency published 11 new nautical charts and 12 new editions, 309 new prints, and 37 reprints of existing nautical charts. The total number of catalogued nautical charts, which are under constant revision and of which revised editions are frequently published, is 879, of which 165 are of Philippine waters. Of special significance was the production during the year of a group of charts adapted to radar navigation. An important cartographic undertaking during the year was the beginning of a series of 35 large-scale charts covering the Gulf Intracoastal Waterway from St. Marks, Fla., to Brownsville, Tex., a distance of 1,126 miles.

Hydrographic surveys covering 11,820 square miles were made, including 30,559 miles of sounding lines, mostly along the East Coast and in Alaska. Topographic surveys for graphic control were made of 317 square miles. including 452 miles of shoreline, almost all in Alaska.

In general, control surveys during the year were concerned with large-scale flood-control and reclamation projects such as in the Columbia River Basin and the Missouri and Trinity River valleys. Surveys were made as follows: First-order triangulation, 2,317 linear miles, covering 49,025 square miles of area; second-order triangulation, 237 linear miles, covering 1,720 square miles; first-order levels, 1,242 miles; second-order levels, 6,070 miles; 14 first-order bases measured, totaling 82 miles; and 12 astronomic stations occupied. Reconnaissance for future triangulation extended along 4,239 miles of arc, covering 73,620 square miles of area. The elevations of 9,450 bench marks were determined, and 2,518 triangulation stations were located. A triangulation connection between Florida and three islands of the Bahama group was effected in a cooperative project with the Corps of Engineers and the Hydrographic Office, utilizing flares released from airplanes.

The standard aeronautical charts of the United States and possessions, 579 in number, were maintained as to aeronautical chart data. This includes 329 instrument approach and landing charts, now being maintained by the Bureau, of a series of about 525 being produced in cooperation with the Army Air Forces. The 37 Flight Charts of the United States were completed. An important accomplishment was the production of the Map of the Northern Hemisphere, North of 39° 30′, showing topography. This map is in two sections on a sterographic projection at the scale of 1:6,336,000 along the parallel of 65°.

Air photographs of 10,200 square miles, covering scattered areas along the Atlantic and Gulf Coasts and the Alaska Peninsula, were taken in collaboration with the Coast Guard. These photographs were used for nautical chart corrections, and for the compilation of 48 planimetric maps and 26 topographic maps. A total of 840 planimetric maps have been published to date, with 352 planimetric and topographic maps awaiting publication. A total of 79 airports were photographed, and 93 airports were surveyed for all purposes during the year.

CORPS OF ENGINEERS (W)

The Corps of Engineers is responsible for all maps and surveys required by the War Department exclusive of the Army Air Forces. In this capacity the Corps directs the activities of many large organizations such as the Army Map Service, Mississippi River Commission, U. S. Lake Survey (all reported separately), and the District Engineer Offices which perform considerable survey work incidental to river development and other activities. Maps for military forces are normally produced in the United States by the Army Map Service, and overseas by topographic personnel of the Corps. During the year, efforts of all Corps of Engineers mapping facilities were concentrated upon the preparation of maps throughout the world that are of potential military interest to the War Department. Map compilations of domestic areas were limited to small-scale strategic maps required by the War Department and to relatively few large-scale surveys of military training areas which had not been scheduled for mapping by Federal civilian agencies.

FEDERAL COMMUNICATIONS COMMISSION

This agency prepares maps primarily for use in connection with hearings and long-range service studies. They are usually of a technical nature and not of particular interest to other than the radio profession. They are generally prepared in small quantities for use as exhibits to aid in frequency allocation problems. All maps presented at hearings as exhibits are public documents and may be obtained or viewed at the Commission offices unless legal restrictions apply.

A map of ground conductivity for the United States and Canada is appended to the Commission's Standards of Good Engineering Practice for

Broadcast Stations and may be obtained from the Government Printing Office. Data used in map compilation is generally the result of surveys either by field measurements or calculations. Base maps used are provided by the Geological Survey, Coast and Geodetic Survey, Bureau of Census, and other agencies.

FEDERAL POWER COMMISSION

The Federal Power Commission prepares and publishes maps showing electric power generating stations and transmission systems, and facilities for production and distribution of natural, manufactured, and mixed gas.

The electric power maps are issued in four series, the scales being one-inch equals 40 miles, one-inch equals 32 miles, one-inch equals 16 miles, and one-inch equals 8 miles. The source material consists of reports furnished to the Commission by electric utilities and industrial companies. The 40-inch per mile map is a wall map and is scheduled for revision as soon as the 8-inch per mile series has been completed. The 32-mile per-inch map was completed in 1945, the 16-mile per-inch map was completed in 1946, and during the year preliminary compilation of the 8-mile per-inch series was completed for about one-third of the United States.

Two series of maps pertaining to gas are produced. State Natural Gas Maps at the scale of about 18 miles per inch have been completed for 33 states, and a new wall map, scale 60 miles per inch, of the United States showing natural gas pipe lines in color, will soon be issued. Restrictions imposed on distribution of these maps during wartime have been removed and copies are now available.

FIELD SERVICE BRANCH (A)

(Formerly Agricultural Adjustment Administration)

This agency completed the aerial photographic and mosaic work assigned by the War and Navy Departments during the year and resumed its normal work on a moderated scale. This work includes acquisition of aerial photography as needed, and the preparation of ratioed aerial enlargements and mosaics for use in administering its conservation programs. New photography of various areas was contracted for, some of which involved areas where existing photography had become obsolete to the degree of being unsuitable for the intended use.

FOREST SERVICE (A)

This agency, which accomplished a number of mapping and charting assignments for the armed services during the war, was converted during the past year to its normal work, which includes the preparation of planimetric and occasionally topographic maps necessary for the administration of national forests. Aerial photographs also play an important part in management, utilization, and protection work in the forests.

The office photogrammetric activities are located in Alexandria, Va. Planimetric maps are now in various stages of preparation for ten areas in Arizona, California, Idaho, Montana, Oregon, and Washington. For certain other areas in Arizona, California, Oregon, and Washington, topographic maps are being prepared to fill an immediate need for determining road locations to stands of timber in highly inaccessible regions.

A series of administrative maps of National Forests are maintained and currently revised as boundaries and other pertinent changes take place.

GEOLOGICAL SURVEY (I)

This agency is charged with the task of making and maintaining an inventory of the nation's mineral wealth, and its terrain, as well as water resources. The terrain inventory—topographic surveys—covers but half the country, and much of the earlier reconnaissance work is in need of revision to meet present requirements. During the year, the Survey readjusted its facilities to the demands of a greatly expanded domestic mapping program.

Approximately 5,300 topographic maps, and 800 planimetric maps, have been published by the Geological Survey to date. Over half the topographic maps are 15-minute sheets of 1:62,500 scale, while most of the remainder are 7½-minute sheets of 1:31,680 scale. The larger-sized 7½-minute sheets of 1:24,000 scale have been produced on many special projects, and the demand for this type of topographic survey is increasing, particularly in areas of high or potentially high economic development.

During the year, 232 new topographic maps were published in addition to 438 reprints of maps whose base stock had become exhausted. In addition to many special maps, 63 geologic maps were published as well as those included in professional papers, bulletins, and water supply reports.

New topographic surveys covering approximately 28,000 square miles were completed during the year and 1,000 square miles of planimetric mapping by use of aerial photographs. The greater part of the topographic mapping was produced by photogrammetric methods supplemented by field surveys in areas of lower relief. This mapping was accomplished in 40 states, California, Illinois, Missouri, Pennsylvania, and Arizona leading in volume. An index map of the United States, showing areas covered by topographic surveys, as well as scheduled projects, is available on request to the Geological Survey's Map Information Office.

To afford necessary control for topographic surveys, over 500 triangulation stations were occupied and many secondary stations were intersected. About 8,900 linear miles of transit transverse and 14,000 miles of leveling, all of third order accuracy or higher, were completed. The results are issued in lithographed lists for quadrangle areas of 15-minute extent and are also available on request.

In connection with geologic and topographic surveys, the Geological Survey has procured to date approximately 165,000 square miles of aerial photography. Contracts have been awarded for about 98,000 square miles of new photography.

The preparation of the Transportation Map of the United States, scale 1:250,000, for the Public Roads Administration, was continued. Forty-eight sheets in Alabama, Indiana, Missouri, Nevada, and Ohio were in various stages of compilation, inking, and checking. Thirty-one sheets in Virginia, Louisiana, North Carolina, West Virginia, and the District of Columbia and vicinity were transmitted for reproduction, and 33 sheets in Texas were published.

Progress continued on the Millionth Scale map of the World. The following sheets I-18 (Hatteras); K-17 (Lake Erie); L-10 (Cascade Range); K-10 (Mount Shasta); H-14 (Austin); H-15 (Mississippi Delta) were transmitted for reproduction. Compilation and drafting were carried forward on the I-17 (Savannah); I-11 (Los Angeles), and preliminary work was started on J-17 (Blue Ridge) and H-17 (St. Augustine). Progress indexes covering the United States portion of this series are available on request.

Revisions of state maps (new compilations) are in various stages of progress and include Wyoming, Massachusetts, Rhode Island and Connecticut, New Jersey, Maryland and Delaware, and Illinois.

During the year many of the state index maps, showing the progress of topographic mapping, were revised. Such maps, owing to war restrictions and other causes, had become out-of-date in states where topographic mapping projects were active. Supplemental lists are maintained for those indexes which have not yet been revised, but the revision program should be completed during the coming year.

The special instruments and procedures of the trimetrogon system of reconnaissance topographic mapping were developed by the Geological Survey during the war. Compilation of basic data for aeronautical charts of the Army Air Forces was continued during the early part of 1946, and production was approximately 435,000 square miles. Contours at 500- and 1,000-foot intervals were added to about 299,000 square miles of the total production. This photo-topographic work is in progress for various foreign areas, including a current Antarctic project. The drafting of preliminary black and white base drawings at 1:250,000 and 1:500,000 scales was completed for 42 charts. In July this program was modified to the effect that the Trimetrogon Section now devotes much of its capacity to a long-range maintenance program, which will result in a currently up-to-date series of aeronautical charts. Complete base maps on 1:1,000,000 or 1:500,000 scales are now prepared on metal mounted boards showing all basic cartographic data ready for color separation drafting. The drafting of black and white preliminary charts has continued. The production has been approximately 44 preliminary charts since July 1, and nine complete photogrammetric base charts ready for color separation drafting. Further progress was made in the development of techniques for production of shaded relief and radar charts.

In connection with the Survey's reorganization to meet greatly increased requirements for geologic and topographic surveys, functions of the Alaskan Branch have been transferred to the Geologic and Topographic Branches, and a new division of the latter has been established with headquarters at Denver to service the many map requirements of development projects arising in the west.

The Map Information Office was reorganized and greatly expanded in service and capacity during 1946.

HYDROGRAPHIC OFFICE (N)

The Hydrographic Office is responsible for supplying the Navy with world-wide coverage of nautical charts and related publications and supplemental data such as sailing directions, light lists, and naval air pilot publications. Data for these are obtained not only from its own facilities and survey vessels but from cooperating observers sailing under every flag and by international exchange of data with similar charting organizations.

From a wartime annual production of about 45,000,000 copies, the 1946 output has been reduced to about 7,500,000 copies reproduced from more than 5,200 basic nautical, aviation, loran, and other special charts. Also produced were 250 publications of supplemental data.

Reconversion to peacetime operations has been rapid even though there are still many naval requirements for special material. Included in the latter category are such assignments as the Cross Roads project which required detailed hydrographic and oceanographic surveys of Bikini Atoll, and participation with the Army Engineers and the Coast and Geodetic Survey in triangulating from the Florida Peninsula to the Bahama Islands.

New activities during the year include the commissioning of two new survey vessels, the *U. S. S. Tanner* and the *U. S. S. Maury*. These vessels are equipped with latest charting devices, including aircraft for special aerial photographic work, reconnaissance, and transportation. A new Division of Oceanography was organized which will, with the cooperation of the Office of Naval Research, coordinate the oceanographic programs of the Navy Department, promote training and basic research at universities and laboratories, collect and codify oceanographic data, and prepare charts, manuals, and special reports therefrom. While the entire field of oceanography will be covered, the greatest emphasis will be on the physical and geological phases.

The Ice Atlas of the Northern Hemisphere, recently published, contains all available information on monthly conditions of sea ice, degree of navigability of various routes, opening and closing of navigation dates for rivers, and other related data. This publication is based on data from about 2,000 shore station localities, and in many cases records extend over a period of 50 years.

Atlases, which show resultant monthly surface currents in each one-degree quadrangle, have already been published for the north Atlantic, northwestern Pacific, and Indian oceans and one for the northeastern

Pacific is in preparation. These atlases will eventually be prepared for all oceans on the globe.

For the Arctic and Antarctic regions special charts and tables for polar navigation have been produced.

INTERNATIONAL BOUNDARY COMMISSION

This commission is concerned with the establishment and maintenance of the international boundaries between the United States, Alaska, and Canada. Its work is comprised of inspection, repair, and replacement of monuments, triangulation stations, and bench marks. It also erects additional monuments where the line crosses international highways and maintains a 20-foot open vista where the line extends through forests. During the year, work of this nature was done on four sections of the boundary, including quite extensive triangulation surveys along the Maine-New Brunswick section.

INTERNATIONAL BOUNDARY AND WATER COMMISSION

This Commission prepares maps needed for the official discharge of its responsibilities in connection with the United States-Mexico boundary and with the administration of water resources along it. During the year, topographic maps were prepared for two major reservoir areas. For a third site an aerial photography project was initiated, and mosaics will ultimately be prepared from the photographs. In each of these three areas, the mapping extended into Mexican territory.

LAKE SURVEY OFFICES (W)

The Lake Survey of the Corps of Engineers maintains charts of the Great Lakes, Lake Champlain, New York channels, Lake of the Woods, and Rainy Lake, primarily for navigation use. They show the hydrography of water areas and topography of limited areas of the contiguous shores and islands so as to show the docks, structures, and the landmarks visible from the lakes and channels. Various scales are employed to portray features in sufficient detail for the purpose of the different classes of charts. The small scale of the general lake charts is suitable for the needs of open-lake navigation; the medium scales of coast, river, and sectional charts afford greater detail for the closer navigation in the areas covered; and the largest scales show the details pertinent to restricted navigation in harbors and confined localities. Surveys during 1946 were limited to those required for maintenance and revision of charts.

LIBRARY OF CONGRESS DIVISION OF MAPS

The Division of Maps administers a collection of approximately 1,000,000 maps, 11,000 atlases, and 70 globes which give extensive areal, subject, and historical coverage. To these collections come all maps, geographical atlases, and globes deposited for copyright, all unclassified maps published by government agencies, thousands of maps and atlases received through international exchange, and many items acquired by purchase and gift. In addition, the Library's collections contain a wide selection of geographical and cartographical publications upon which the Division of Maps may draw.

During the year, approximately 190,000 maps were distributed to public, college, and university libraries and 400.000 more are now held for similar distribution. In addition to having maps and geographical information available to persons visiting the Library, much information is given through correspondence, loans of maps and atlases, and the furnishing of photographic reproductions.

An active program for augmenting the collection of state and local maps is under way. As a first step, the Library is communicating with all cities in the United States to acquire their latest plans.

MAP INFORMATION OFFICE (U. S. GEOLOGICAL SURVEY) (I)

During the year, this office was reorganized by the Geological Survey and expanded from its dormant wartime status of one or two employees into a service organization of 22 research specialists and assistants. The office was formerly an agency of the Federal Board of Surveys and Maps and was continued in the Geological Survey when other functions of the Board were transferred to the Bureau of the Budget.

The maintenance of complete information on all published, or otherwise available, topographic maps, aerial photography, mosaics, and geodetic control, as well as data pertaining to work in progress and new schedules of the various Federal agencies, are the primary functions of the Map Information Office.

A preliminary study of the status of topographic mapping in the United States, with a tentative evaluation, has been completed, and copies of the resulting index map and descriptive text are available on request. A similar study of aerial photography has been made, and the results have been published in map and text form. Index maps of the United States showing all vertical and horizontal control survey suitable for various engineering requirements, as well as control of topographic maps and photo-mosaics. will be compiled and published in the near future.

The bulletin on map collections maintained in the vicinity of Washington is being revised and will include statements concerning the activities now pursued by the Federal agencies engaged in surveying and mapping as well as the present development of major map collections and research facilities.

In addition to the functions mentioned, the preparation of exhibits and press articles concerning topographic mapping has been assigned to the Map Information Office. Information requests by Survey production offices, other Federal and state agencies, and the general public, increased enormously during the year, and the awakening map consciousness of the nation at large makes inevitable an accelerating increase in service requests.

DIVISION OF MAP INTELLIGENCE AND CARTOGRAPHY (S)

The Map Library of the Department of State now constitutes one of the three or four major map collections in the United States. It does not attempt to compete with the Army Map Service, the Hydrographic Office, or the Aeronautical Charts Service in the field of topographic maps, nautical charts, and aeronautical charts, or with the Library of Congress in the collection of domestic and historical maps. The Library does contain, however, an unusually comprehensive and up-to-date collection of specialty maps covering political, economic, and social aspects of foreign areas. The Library contains approximately 2,500,000 foreign maps and more than 15,000 atlases, gazetteers, and other cartographic reference items. It has a monthly turnover of more than 100,000 items, and it catalogs and indexes all new acquisitions which are subsequently filed according to an area and subject breakdown for ready reference.

The Map Library contains the map resources of several war agencies as well as the maps and map reference materials collected by the Division of Geography and Cartography (Ge) in the Department of State. The Library distributes maps and provides map reference and procurement service to authorized government agencies.

Specialized research is carried on to provide official agencies with evaluations of maps, and new maps are compiled at medium and small scales to fulfill special requirements of the Department of State and other official agencies.

MISSISSIPPI RIVER COMMISSION (W)

This Commission is responsible for improvement of the lower Mississippi and tributaries in the alluvial valley for flood control and navigation. For this purpose the Commission maintains a series of topographic maps, 220 in number, covering an area of more than 52,000 square miles. During 1946, 17 new maps were published, and the fourteenth edition of the map folio for navigation was revised as well as the index of topographic maps. An exhaustive study pertaining to geologic investigation in the alluvial valley was published. Folios of navigation maps of various tributaries were revised and republished.

OFFICE OF INDIAN AFFAIRS (I)

This agency prepares maps and procures aerial photography, primarily for use in administering Indian reservations. During the year, old maps of three such reservations were revised, and work was started on one new reservation map. Present plans contemplate obtaining new aerial photography for the remaining 37 reservations as quickly as possible; for preparing mosaics from this photography; and for preparing planimetric maps by direct transcription from the mosaics. The total area of the reservations remaining to be so mapped is slightly over 24,000 square miles.

PUBLIC ROADS ADMINISTRATION (FWA)

During 1946, the Public Roads Administration published one new transportation map (Texas) comprising 33 sheets and revised editions for five states aggregating 40 sheets. It completed, since Dec. 1, 1945, 24 maps of the State-wide Highway Planning Survey County Series of which 15 are highway base maps, and nine show surfacing types. There remain uncompleted in Georgia, New York, and Pennsylvania, maps for 87 counties. Of these, work is in progress on all but six counties, and prints of the uncompleted maps are obtainable for 75 counties. General highway maps of all but seven have been compiled.

Prints or photolithographic reproductions of both county and state maps are obtainable by purchase from the State Highway Departments of the several states at approximately the cost of reproduction. The country maps have been drawn to scales of approximately one or two inches to the mile. Many of the states have published half-scale reproductions which are available at considerably reduced prices. The state maps are generally compiled at the scale of one-inch to eight miles.

A wall map of the United States, 5 x 7 feet, showing the system of numbered highways, is published in two sheets. A map about 28 x 42 inches (scale 1:5,000,000) is also published. They are available from the Superintendent of Documents, Government Printing Office, for $1 and 25 cents, respectively.

SOIL CONSERVATION SERVICE (A)

This agency prepares and publishes maps showing physical land conditions with particular relation to soil erosion and conservation studies and also prepares mosaics from aerial photographs for field use in the various Soil Conservation Districts.

During the year, conversion from war assignment work for the armed services to peacetime activities took place, and physical land maps were prepared for areas in Ohio, Georgia, Florida, Oregon, Kansas, and Alaska. Numerous mosaics of conservation districts were prepared, and large new projects were initiated in Colorado and New Mexico. Copies of the mosaics and the maps are available for distribution.

SOIL SURVEY (BUREAU OF PLANT INDUSTRY, A)

After a suspension of field soil surveys during the war period, activities on this work were again resumed about mid-year, and by the end of the year this agency and cooperating state agencies had completed new soil surveys on about 1,150,000 acres of land.

During the year, ten detailed soils maps and accompanying explanatory bulletins were issued, making a total of 1,550 such reports issued to date. The new reports pertained to areas in California, Indiana, Kentucky, Missouri, Tennessee, Virginia, and Utah. Similar reports will be issued for the areas in which the new field work was accomplished.

TENNESSEE VALLEY AUTHORITY

When the war intervened, the Tennessee Valley Authority was engaged in preparing standard 7½-minute quadrangle topographic maps of the Tennessee River watershed at a scale of 1:24,000. (See THE AMERICAN YEAR BOOK, 1943, page 297, and 1944, page 291.) After a four-year lull, work was resumed, and during 1946 final edition maps were published for approximately 2,000 square miles.

Property surveys for the Watauga Reservoir, on which work had been discontinued because of material shortages, were resumed and predredge surveys were made in the upper end of Pickwick Reservoir for navigation channel improvements. (See THE AMERICAN YEAR BOOK, 1943, page 297 for description of cadastral and navigational mapping.)

OTHER AGENCIES

While the agencies enumerated above may be considered the principal surveying, map compiling, or map research organizations of the Federal Government, others which are extensive map users also prepare special maps and make occasional surveys of diversified nature or otherwise operate in collateral fields.

The Bureau of the Census compiles special maps for use in Census surveys. They are largely analytical in character and are used to illustrate the various census reports. The state maps showing minor civil divisions are in frequent demand. The Civil Aeronautics Administration does not publish charts and maps, but aids in the development of new charts and supplies information to the Coast and Geodetic Survey for the preparation of aeronautical charts. The Bureau of Agricultural Economics prepares statistical maps covering the entire field of agricultural production and marketing to accompany the detailed reports it issues on those subjects. The Weather Bureau prepares for distribution a daily weather map which is in great demand for a number of uses including air transportation. The National Park Service makes occasional surveys for development work, but most maps of the National Parks are prepared and distributed by the Geological Survey. Many other agencies, such as the Fish and Wildlife Service, National Housing Authority, National Archives, and Bureau of Foreign and Domestic Commerce are extensive map users and as such have occasion to compile specialty items of a collateral nature.

Various state and commercial agencies contribute very substantially to the over-all production of surveys and maps, notably the highway departments and the oil industry in their geophysical and exploratory activities. Several large commercial concerns have developed extensive capacities for aerial photography and large-scale mapping and do considerable contract work for government and state organizations and the oil industry.

SURVEYING AND MAPPING SOCIETIES

The American Congress on Surveying and Mapping is dedicated to the advancement of such activities in the Western Hemisphere. Its journal, *Surveying and Mapping,* is a quarterly publication which covers this entire field. The 1946 annual meeting of the Congress was held in June at Washington, D. C.

The American Geophysical Union has a section devoted to Geodesy, while other technical sections of the Union are concerned with many collateral aspects of surveys and maps. The Union is affiliated with the National Research Council of the Academy of Sciences and publishes bimonthly *Transactions.*

The American Society of Civil Engineers has a technical division which deals with surveying and mapping, while other divisions are concerned with divergent aspects of the broad field of engineering. *Civil Engineering,* a monthly publication of the Society, is devoted to professional articles and items of general interest, while technical discussions are covered in the *Proceedings,* also published monthly.

The American Society of Photogrammetry is dedicated to the advancement of photogrammetry and serves as a clearing house for information pertaining to all phases of that science. Its journal, *Photogrammetric Engineering* is published quarterly. The Society also publishes the *Manual of Photogrammetry* which is the standard reference text in that field. Its annual meeting is usually held in January at Washington and a semiannual meeting elsewhere.

STATE GEOLOGICAL SURVEYS

By Wilson M. Laird
State Geologist, North Dakota

GENERAL

The state geological surveys or their equivalents and the state bureau of mines are carrying on their work in the same efficient fashion. These organizations render their service in a usually quiet and unspectacular manner and for the money expended they provide benefits to their respective states all out of proportion to the amount of money appropriated to them.

The work of some of the state surveys is beginning to be more appreciated in some states, as is evidenced by increased appropriations. On the other hand, some of the states are receiving less now than in the war years when great emphasis was laid on strategic minerals. In several of the states, the state geologist or director of the state survey or bureau of mines is a member of the state planning board and has taken a large part in the planning of the future development of his respective state. This is of great advantage as the successful use of mineral resources is most important in the planning of future industrial development.

A number of the states have taken long strides in the matter of the public education of the citizens of their states in geological matters. This education is in the form of exhibits, printed literature appealing to the popular reader in non-technical terms, mineral industry conferences or in the nature of conducted field trips to points of geologic interest. One state geologist was recently voted the most influential citizen in science of his state. This is a high tribute to him and to the state survey he represents and to the profession of geology as a whole.

With the restrictions on the types of paper removed and availability of different types of paper, the character and attractiveness of the state survey's publications is increasing. These publications present to the citizens of the state concerned and the nation as a whole the results of their tax money spent for scientific investigations of a geologic nature. Whether we wish to believe it or not, we are living in an age of science, and the people must be kept informed of the progress of scientific endeavor in their own state. Research in geologic fields and related sciences can and has done much to bring the nation to its present high position in the industrial and scientific economy of the world.

Cooperation with various Federal agencies has continued and appears to be increasing on a large scale. This appears to be particularly true in the field of underground water, although some states carry on their own underground water programs without cooperating financially with the U. S. Geological Survey. Most of the cooperation with the Federal Survey is on a 50-50 basis financially and, therefore, the state derives more benefit if its money is advanced for matching. The Federal Government also benefits as it gains the information and experience which is in turn applied to similar problems in all parts of the country. Thus, the nation as a whole benefits.

Some of the states are also cooperating with the U. S. Geological Survey on geologic work other than ground water. In at least one state, all the geologic work done by the state is through Federal cooperation with non-technical state employees. In a number of other cases, the cooperation is on an informal basis without written agreement. This latter type of agreement seems to be preferable at present where it is being employed. In other cases, it seems more advisable to use a written agreement.

At the present time, practically all topographic mapping is being done in cooperation with the Topographic Branch of the U. S. Geological Survey. This type of work requires specialized techniques and equipment, as well as a large trained personnel; this type of organization can best be handled by the Federal Government. It also has the advantage of providing some degree of coordination of the topographic mapping on a nationwide scale and the size and scale of the resulting maps.

With the exception of some of the more specialized skills, such as topographic mapping which can be handled best by the Federal Government, it seems that much of the work of a geologic nature should be handled in the state concerned by a state agency such as the state geological survey or the state bureau of mines. The state agency is better able to handle the day-to-day requests because of its more intimate knowledge of local conditions and the people concerned. The Federal Government can better handle large regional projects which perhaps overlap state lines or projects such as specialized fundamental research in any number of geologic problems that involve such large expenditures of funds and are too large to be handled by one state alone.

ALABAMA

Organization.—Geological Survey of Alabama, University, Dr. Walter B. Jones, State Geologist.

Basic and Economic Geology.—*Projects:* Well logs; Coosa coal field.

Publications: Red iron ores of northeast Alabama; State oil and gas regulations and forms.

Water Resources.—*Projects:* Natural water losses of Alabama; Ground water of south Alabama.

Others.—*Projects:* Beetles of Alabama.

ARIZONA

Organization.—Arizona Bureau of Mines, Tucson, T. G. Chapman, Director.

Basic and Economic Geology.—*Projects:* Relation of structure to ore deposits in western and central Arizona; Routine examination of mineral deposits; Completion of Tombstone mining district report; Barite, perlite and asbestos deposits; Volcanic cinders as concrete aggregate. *Publication:* Minerals of Arizona.

Water Resources.—*Projects:* Compilation of data relative to ground water in the Tombstone district.

Topographic and Planimetric Mapping.—*Publication:* Topographic and highway map of Arizona.

Others.—*Projects:* Compilation of mineral production statistics; Cooperation in mineral exploration with the U. S. Geological Survey and the U. S. Bureau of Mines; Compilation of map showing state-owned lands in Arizona. *Publications:* Metallic mineral map of Arizona; Non-metallic map of Arizona; Map of Arizona mining districts.

ARKANSAS

Organization.—Division of Geology, Little Rock, Harold B. Foxhall, Director.

Basic and Economic Geology.—*Projects:* Rock wool; nepheline syenite for ceramics; Bentonite clay deposits; Study of the economics of coal in Arkansas; Mine mechanization and coking experiments; Brookite deposit in Hot Springs County; Ilmenite deposit in Howard County; Ilmenite in Arkansas River sands; Limestone deposits of the Batesville area; Brick clay investigations; Slate for granules.

Water Resources. — *Projects:* Stream gaging at 46 stations.

Topographic and Planimetric Mapping.—*Project:* Malvern quadrangle. *Publications:* St. Paul; Alexander, Benton; Bryant; Little Rock; Pinnacle; Spring Lake; Sweet Home quadrangles.

CALIFORNIA

Organization. — California State Division of Mines, San Francisco, W. B. Tucker, State Mineralogist.

Basic and Economic Geology.—*Projects:* Geology of the following quadrangles: Tesla, Indian Gulch, Priest Valley, Copperopolis, St. Helena, Nipomo, Hollister, San Fernando, Ubehebe Peak, Neenach, Gasquet, Hoaglin, Cerro Gordo, Cuyamaca Peak, Bishop No. 2, Mt. Goddard No. 1, Lake Elsinore; Geology of the foothill cooper-zinc belt; Tabulated list of the copper deposits of California; New Almaden quick-silver district; Weaverville copper-gold district; Geology of the Mother Lode district; Supplement to Bulletin 125 on manganese; Lead-silver-zinc bulletin and map; Silica minerals of California; Talc deposits of California; San Diego pegmatite area; Sand deposits of the coastal region of California. *Publications:* Iron Resources of California (*Bull. 129*); Geology of the San Juan Bautista quadrangle and operation of the Granite Rock Company quarry and plant at Logan (*Bull. 133*); Geological investigations of chromite in California (*Bull. 134*); Placer mining for gold in California (*Bull. 135*); Limestone in California (*Bull. 136*); California Journal of Mines and Geology for January, April, July and October 1946.

Others.—*Projects:* Economic development of metallurgy of copper and zinc in California; California mineral production for 1945. *Publications:* Economic mineral resources and production of California (*Bull. 130*); Consolidated index to Division of Mines publications (*Bull. 131*); California mineral production for 1944 (*Bull. 132*).

COLORADO

Organization.—Colorado Geological Survey, State Museum Building, Denver, Dr. Ben H. Parker, Secretary.

Basic and Economic Geology.—*Projects:* Geology and mineral resources of Cripple Creek, San Juan. Kokomo, Ophir, Leadville-Minturn-Redcliff. All work done on cooperative basis with United States Geological Survey.

CONNECTICUT

Organization.—Connecticut Geological and Natural History Survey, Hartford, Dr. Edward L. Troxell, Director.

Basic and Economic Geology.—*Projects:* Investigation of copper mine; Collection of minerals for school use; Research on loess, garnet, kaolin, pyrophylite for industrial use.

Others.—*Projects:* Chestnut tree research; Tree Census; Arboretum. *Publications:* Mosquitoes of Connecticut.

FLORIDA

Organization.—Florida Geological Survey, Tallahassee, Dr. Herman Gunter, State Geologist.

Basic and Economic Geology.—*Projects:* Micropaleontology; Geology and structure of Levy and Citrus Counties; Correlation of well data; Peat investigation; Prospecting for rare earths.

Water Resources. — *Projects:* Ground water studies; Surface water studies; Quality of water.

Others. — *Project:* Cooperative study on clay prospecting.

GEORGIA

Organization. — Department of Mines, Mining and Geology, Atlanta 3, Garland Peyton, Director.

Basic and Economic Geology.—*Projects:* Geology and mineral resources of Rabun County; Geology and mineral resources of the Paleozoic area; Preliminary oil and gas map of the Tertiaries of Coastal Plain; A survey of the iron ore resources of Polk and Barton Counties; Special study of lightweight aggregate materials in Georgia; Special study of the sericite deposits of Georgia. *Publications:* Talc deposits of Murray County (*Bull. 53*); Geology of east central Georgia (*Bull. 52*).

Water Resources.—*Projects:* Geology and ground-water resources of central east Georgia. *Publication:* Geology and ground-water resources of east central Georgia (*Bull. 52*).

Topographic and Planimetric Mapping. — *Projects:* Planimetric mapping of Paleozoic area; Planimetric map of central east Georgia; Planimetric map of Chatsworth talc area. *Publications:* Geologic map of the Tertiaries of Coastal Plain; Map of east central Georgia; Map of central east Georgia.

Others. — *Projects:* Cooperative field project to investigate radioactive minerals in Georgia. *Publications:* Geologic map in color of east central Georgia; Mineral producers directory.

IDAHO

Organization.—Idaho Bureau of Mines and Geology, Moscow, Dr. A. W. Fahrenwald, Director.

Basic and Economic Geology.—*Projects:* District reconnaissance surveys; Geologic reconnaissance of the Hailey gold belt, Blaine County; Geologic reconnaissance of the Avery area, Shoshone County; Reconnaissance survey of diatomite occurrences in southern Idaho. *Publications:* A geological reconnaissance between the Snake and Salmon rivers north of Riggins, Idaho (*Pamph. 74*); A geological reconnaissance in the Little Wood river (Muldoon) district, Blaine County, Idaho (*Pamph. 75*).

ILLINOIS

Organization. — State Geological Survey Division, State Department of Registration and Education, Urbana, Dr. M. M. Leighton, Chief.

Basic and Economic Geology.—*Projects:* Areal investigations and geologic mapping; Engineering geology reports on highway conditions and damsites; Pennsylvanian and Mississippian stratigraphy; Silurian stratigraphy; Cambro-Ordovician stratigraphy; Pleistocene system; Micropaleontological studies; Paleobotany of the Pennsylvanian; Preparation of contour map of the bedrock surface; Geology and oil and gas resources of the Illinois basin; Secondary recovery of oil in Illinois; Studies of reservoir conditions in Illinois oil pools; Classification of potentially oil-bearing areas by geologic systems; Scouting of drilling wells and cooperation with Illinois Scout Check; Mapping and study of Illinois coal resources; Lithological and botanical constitution of Illinois coals; Studies to determine the usefulness of coal spores as index fossils; Smokeless briquets from Illinois coals; Investigation of combustion behavior of Illinois coals to develop improved stoker fuels; Investigation of the suitability of low-sulphur Illinois coals for use in the production of metallurgical coke; Chemical study of tars prepared from Illinois coals in commercial and pilot plant coking operations; The chemical constitution of Illinois coals; Proximate and ultimate analysis of Illinois coals; Fluorspar resources of southern Illinois; Utilization of fluorspar; Petrology of Illinois clays; Clay mineralogy as related to soil materials and engineering problems; Surface clay resources of Illinois; Research on clay and clay products; Limestone resources of Illinois; Investigation of the physical properties of Illinois silicas; Viscosity of silicate melts. *Publications:* A major buried valley in east-central Illinois and its regional relationships (*R.I. 106*); Rosiclare-Fredonia contact in and adjacent to Hardin and Pope counties (*R.I. 112*); Kincaid corals from Illinois and Amplexoid corals from the Chester of Illinois and Arkansas (*R.I. 113*); Subsurface relations of the Maquoketa and "Trenton" formation in Illinois and oil possibilities of the Maquoketa and "Trenton" formations (*R.I. 105*); Marine pool, Madison County—a new type of oil reservoir in Illinois (*R.I. 114*); Developments in eastern Interior basin in 1944 (*I.P. 51*); Oil and gas developments in Illinois in 1944 (*I.P. 52*); Resaturate while repressuring (*Cir. 118*); Rustless pipe for war and peace (*Cir. 120*); Oil and gas drilling reports 104-115; Coke from Illinois coals—an experimental slot-type oven (*R.I. 107*); Geological aspects of prospecting and areas for prospecting in the zinc-lead district of northwestern Illinois (*R.I. 116*); Amenability of various types of clay minerals to alumina extraction by the lime sinter and lime-soda sinter processes (*Bull. 69*); Illinois surface clays as bonding clays for molding sands (*R.I. 104*); Molecular association between montmorillonite and some polyfunctional liquids (*R.I. 108*); Bonding action of clays; Clays in dry molding sands (*R.I. 110*); Viscosity studies of the system CaO-MgO-Al_2O_3-SiO_2: I, 40% SiO_2 (*R.I. 111*); Diagnostic criteria for clay minerals (*R.I. 115*); Agstone used in Illinois in 1944 (*Cir. 119*).

Water Resources. — *Projects:* Ground-water geology of industrial, urban, and special areas; Electrical resistivity surveys for subsurface water-bearing sand and gravel deposits; Geophysical logging of water wells; Cooperation with Illinois Water Well Drillers Association. *Publications:* Use of electrical geophysical methods in ground-water supply (*Cir. 122*).

Topographic and Planimetric Mapping.—*Projects:* Following quadrangles: Alton, Augusta, Barrington, Bethalto, Buckley, Camp Grant, Camp Point, Coal Valley, Crete, Cullom, Davenport, Dunlap, Edwardsville, Elgin, Elmwood, Fairfield, Geneva, Grays Lake, Hillsboro, Joliet, Kansas, Kings, Kinmundy, Marine, McHenry, Mendon, Milon, Morris, Morrisonville, Muscatine, Orion, Pana, Paris, Peoria, Peotone, Piper City, Prairie Home, Ramsey, Ridgefarm, Rockford, St. Jacob, Silvis, Stewardson, Vandalia, Wapello, Wayne City, Wheaton, Wilmington, Woodhull, Wood River, Woosung, Yorkville. *Publications:* Following quadrangles: Albion, Ashley, Bradford, Forreston, McLeansboro, Shelbyville.

Others.—*Projects:* Economic review of mineral industries; Atlas of Illinois resources; Long term manufacturing opportunities in Illinois; Handbook of fuels data; Studies of southern Illinois economic problems. *Publications:* Oil and gas map of Illinois; Soil survey maps.

INDIANA

Organization. — Indiana Department of Conservation, Division of Geology, Bloomington, Dr. Charles Deiss, State Geologist.

Basic and Economic Geology.—*Projects:* Compilation of Indiana mineral industries catalog; Microscope study of oil and gas well cuttings as basis for subsurface stratigraphy; Special consulting for operators; Large scale mapping and analysis of clay deposits in Lawrence County. *Publications:* Stratigraphy of four deep wells in eastern Indiana (*R.P. 1*); The Physiography of the lower Wabash Valley (*Pub. 134*); The Budda outliers of the Mansfield sandstone, Lawrence County, Indiana; The Geology of Cataract Falls, Owen County, Indiana.

Water Resources.—*Project:* Projects in cooperation with Division of Water Resources and United States Geological Survey.

Others.—*Publication:* Monthly oil and gas drilling reports; Oil and gas activities in Indiana in 1945

IOWA

Organization. — Iowa Geological Survey, Iowa City, Dr. A. C. Trowbridge, Director and State Geologist.

Basic and Economic Geology.—*Projects:* Pleistocene history of the Mississippi River; Stratigraphy of the Upper Des Moines series; Geology of Floyd County; Subsurface geology of the Cambrian strata of Iowa; Revision of the Kinderhook formations in Iowa; Bibliography of Iowa geology; Subsurface studies of the Kinderhook and Osage groups in southeastern Iowa; Summary of the agricultural limestone resources in south-central Iowa; Mineral production reports.

Water Resources. — *Projects:* Ground-water resources of Cerro Gordo County; Geology and ground-water resources of Webster County; Geology and ground-water resources of Cedar Rapids and vicinity; Mineral analysis of underground waters of Iowa; Surface water resources of Iowa 1942-44.

Others.—*Publication:* Mineral resources map of Iowa.

KANSAS

Organization. — State Geological Survey of Kansas, Lawrence, Dr. R.

C. Moore, State Geologist, Dr. J. C. Frye, Executive Director.

Basic and Economic Geology.—*Projects:* Geology and oil and gas resources of Crawford County; Collection of mineral statistics; New mineral resources map of Kansas; Geologic cross sections of eastern Kansas; General stratigraphic and lithologic studies in eastern Kansas; Chemical analysis of Kansas rocks and minerals; Oil and gas resources of Bourbon County, Neosho County, Chautauqua County; Oil and gas developments in eastern and western Kansas in 1946; Oil and gas resources of Miami County; Structural development of the Salina Basin; Subsurface rocks of the Upper Cambrian and Lower Ordovician age in Kansas; Investigation of oil shales in Kansas; Collection of well samples, cores and logs; Subsurface stratigraphy along the west flank of the central Kansas uplift; Coal resources of the Wabaunsee group; Lignite resources of the Dakota formation of Cretaceous age in north-central Kansas; Clays of the Dakota formation of Kansas; Preliminary report of Kansas clays; Molding sand resources of Kansas; A study of flint gravel deposits in eastern Kansas; Industrial uses of ceramic slag; Petrology and uses of quartzitic sandstones of the Dakota formation in central Kansas; Special tests and studies of clays near Great Bend. Norton, and other communities for brick and tile plants. *Publications:* The Cheyenne sandstone and adjacent formations of part of Russell County (*Bull. 60*); Exploration for oil and gas in western Kansas during 1946 (*Bull. 62*); Petrographic comparison of Pliocene and Pleistocene volcanic ash from western Kansas (*Bull. 64*); Silicified rock in the Ogallala formation (*Bull. 64*); Strip mined areas in southeastern Kansas coal field (*Bull. 64*); Oil and gas investigations preliminary cross section No. 1; Oil and gas investigations preliminary cross section No. 2.

Water Resources.—*Projects:* Geology and ground-water resources of Equus beds area, Kiowa County, Seward County, Scott County, Pawnee and Edwards County, Jewell and Republic County, Kansas City industrial area, Lower Arkansas valley, Stafford and Barton County, Norton County, Kingman County, Rice County, Smoky Hill valley from Lindborg to Junction City, Pawnee Valley, North fork of the Soloman river; Observation well program. *Publications:* Geology and ground-water resources of Grant, Haskell, and Stevens Counties (*Bull. 61*); Ground-water conditions in Elm Creek valley, Barber County, with special reference to contamination of ground water by oil field brine (*Bull. 64*); Ground-water conditions in the Arkansas River valley in the vicinity of Hutchinson, Kansas (*Bull. 64*).

Topographic and Planimetric Mapping. — *Projects:* Topographic mapping in Cherokee, Crawford, Labette, Neosho, Allen, Leavenworth, Jefferson and Bourbon Counties. *Publications:* Pittsburg, McCune quadrangles.

Others. — *Publication:* Glimpses from Resource-Full Kansas.

KENTUCKY

Organization.—Kentucky Department of Mines and Minerals, Geological Division, Lexington, D. J. Jones, State Geologist.

Basic and Economic Geology.—*Projects:* Compilation of deep well data.

Water Resources.—*Projects:* One ground-water project covering four counties; One state-wide water survey.

Others.—*Project:* Limestone analysis. *Publications:* Three county geographic maps.

LOUISIANA

Organization.—Louisiana Geological Survey, Baton Rouge, Paul Montgomery, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of Red River, DeSoto, Webster Allen Beauregard parishes; Oil and gas reserve estimates, basic and recalculations; Investigation of ceramic possibilities of Louisiana. *Publications:* Geology of DeSoto and Red River parishes; Field report on the Great Delhi area, Richland Parish, Louisiana.

Water Resources.—Projects: Special investigations in specific problem areas.

MAINE

Organization.—Maine Geological Survey, Orono, Dr. Joseph M. Trefethen, State Geologist.

Basic and Economic Geology.—*Projects:* Investigations on gold, feldspar, limestone and clay. *Publications:* Petrology of the Columbia Falls quadrangle (*Bull. 3*); Aroostook County manganese deposits (*Bull. 4*); Pegmatites of Topsham area (*Bull. 5*).

MARYLAND

Organization.—Department of Geology, Mines and Water Resources, Baltimore 18, Dr. Joseph T. Singewald, Jr., Director.

Basic and Economic Geology.—*Projects:* Geologic mapping Montgomery County; Petrography and paleontology of cores and cuttings from two eastern shore wells drilled to bedrock; Fire clays of Allegany and Garrett Counties. *Publications:* Carroll and Frederick Counties Report.

Water Resources. — *Projects:* Ground-water resources of the Baltimore area; Ground-water resources of southern Maryland.

Topographic and Planimetric Mapping. — *Projects:* Remapping Prince George's and Garrett Counties maps. *Publication:* Prince George's County.

MICHIGAN

Organization.—Geological Survey Division, Michigan Department of Conservation, Lansing, Gerald E. Eddy, State Geologist.

Basic and Economic Geology.—*Projects:* Limestones of southeastern Michigan; Niagaran formations; The Marshall formation; The Pleistocene; Public education in geology; Stratigraphic research in petroliferous formations; Study of the Crystal Falls, Iron River, and Amasa districts of Iron County; Geology of western Marquette range; Geology of Ropes gold mine area near Ishpeming; Investigation of non-metallic resources along Pennsylvania Railroad right of way. *Publications:* Pre-historic Mackinac Island (*Pub. 43*); Geology of the Mackinac Straits region (*Pub. 44*).

Water Resources.—*Projects:* Survey of water wells in the State; Study of city water supply problems of Flint, Holland, Mt. Pleasant, Kalamazoo, Battle Creek, and Benton Harbor; Investigation of lake level control problems; Ground-water fluctuations in north-central Michigan. *Publications:* Ground-water resources of the Lansing area; Ground-water resources of the Benton Harbor area.

Others.—*Publications:* Biennial report of the State Geologist; Minerals find new use—nylon; Exercise control when selecting location on Lake; Ways sought to control wave action; Biology in Michigan geologic column; Oil and gas in Michigan in 1945; Annual appraisal report on iron and copper mines; Annual statistics covering iron mining costs.

MINNESOTA

Organization.—Minnesota Geological Survey, Minneapolis, Dr. George M. Schwartz, Director.

Basic and Economic Geology.—*Projects:* Geology of Cook County; Geology of the Duluth metropolitan area; Revision of the paleontology and stratigraphy of the Cambrian and Ordovician beds; Revision of the geology of the Mesabi range; Revision of the geology of the Cuyuna range.

Water Resources.—*Project:* Geology and water resources of northeastern Minnesota.

Topographic and Planimetric Mapping.—*Project:* Cooperative program with the U. S. Geological Survey.

MISSISSIPPI

Organization.—Mississippian State Geological Survey, University, Dr. William C. Morse, State Geologist.

Basic and Economic Geology.—

Projects: Itawamba County mineral resources; Lafayette County mineral resources. *Publications:* Light-weight aggregate (*Bull. 61*); Rock wool (*Bull. 62*); Lee County mineral resources (*Bull. 63*).

Water Resources. — *Projects:* Ground-water supply of Jackson, Mississippi; Ground-water resources of 19 counties of the Alluvial plain; Regular stream gaging program.

MISSOURI

Organization.—Geological Survey and Water Resources Division, Department of Business and Administration, Rolla, Dr. Edward L. Clark, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of the Gulf coast embayment; Geology of Bates County; Geology of the Alice Mine district; Geology of the Wellsville quadrangle; Post-Cambrian igneous activity in southeastern Missouri; The fauna of the Chester series in southwestern Missouri; The Pleistocene deposits of Missouri; Studies in the disseminated lead belt; Structural control of the zinc deposits in the Tri-State district; Geophysical studies in the Fredericktown district; The Floyd Tower magnetic anomaly; The iron deposits of Pilot Knob and Iron Mountain districts; The extraction of feldspar from Missouri granites; Barite mining district of Washington County; The clay resources of the Polo gas field; Light weight aggregates from shales; The limestones and dolomites in St. Louis County. *Publications:* The mineral deposits of Morgan County (*R.I. 2*); The marble industry in Missouri (*R.I. 3*); Addresses presented at the dedication of the Buehler building (*I.C. 1*); Research in the mineral industries (*I.C. 2*); Post-Cambrian igneous activity in southeast Missouri (*R.I. 4*); Geophysical technique applicable to Missouri (*I.C.*); Insoluble residue zones of the Lower Ordovician rocks of Missouri (*R.I.*).

Water Resources.—*Projects:* Continuous gaging of approximately 87 stations; Miscellaneous efficiency testing of deep wells.

Topographic and Planimetric Mapping. — *Projects:* Continuous mapping of about 40 quadrangles. *Publications:* Topographic quadrangles as follows: Berryman, Boss, Bradleyville, Couch, Cureall, Ellington, Florida, Grandin, Lesterville, Millersburg, New Florence, Sedalia East, Sedalia West, Thayer, Van Buren, West Plains.

Others.—*Publication:* Biennial report of the State Geologist, 64th General Assembly.

MONTANA

Organization.—Montana State Bureau of Mines and Geology, Butte, Dr. Francis A. Thomson, Director.

Basic and Economic Geology.—*Projects:* Completion of state geologic mapping; Study of deeper horizons as possible sources of petroleum; Study of the factors controlling deposition of Montana ore deposits in sedimentary rocks; Study of the Hecla (Bryant) mining district; Compilation of information on placer mining and gold placers in Montana; Study of the geology and ore deposits of the Highland district; Study of the occurrence and utilization of talc, kyanite and graphite. *Publications:* Stratigraphic sections of the Upper Paleozoic and Mesozoic rocks in south-central Montana; Mississippian and Devonian stratigraphy of northwestern Montana (*USGS Prel. Chart 15*); Devonian stratigraphy of central and northwestern Montana (*USGS Prel. Chart 25*).

Water Resources.—*Projects:* Continuation of general ground-water studies.

Others.—*Projects:* Study of the mining problems of small mine operators and prospectors; Mineral dressing studies for the beneficiation of Montana ores.

NEBRASKA

Organization.—Conservation and Survey Division, Lincoln, Dr. G. E. Condra, Director and State Geologist.

Basic and Economic Geology.—*Projects:* Surface and subsurface studies; Bryozoan studies; Oil field subsurface studies; Stratigraphic study of coal deposits; Mineral resource studies. *Publications:* Correlation of the Pleistocene formations of Nebraska.

Water Resources. — *Projects:* Ground-water resources of the southeastern Nebraska counties; Central Platte valley; Permeability tests; Water table observations. *Publications:* Five informal county reports; Ground water of the Republican valley.

Others.—*Projects:* Soil inspection and correlation work; Conservation and industrial studies. *Publications:* Industrial Nebraska in outline.

NEW JERSEY

Organization.—Bureau of Geology and Topography, Trenton, Meredith E. Johnson, State Geologist.

Basic and Economic Geology.—*Projects:* Recording of new data on geology and mineral resources of New Jersey; Compilation of logs of deep wells; Continued investigation of iron ore prospects; Investigation of ore genesis and relations in operating mines; Investigations of limesand and feldspar. *Publication:* Differential thermal analysis of New Jersey clays.

Water Resources.—*Project:* Continued study of the ground-water resources of New Jersey.

Topographic and Planimetric Mapping.—*Projects:* Atlas sheets 21, 23, 29; Maintenance of geodetic control monument system. *Publications:* Atlas sheets 23, 25, 29, 33, 36.

Others.—*Publication:* Bibliography and index of the geology of New Jersey, 1943-1945 (*Bull. 59*).

NEW HAMPSHIRE

Organization.—Mineral Resources Committee, New Hampshire State Planning and Development Commission, Durham, T. R. Myers, Geologist.

Basic and Economic Geology.—*Projects:* Surficial geologic map of New Hampshire; Preliminary examination of foundry sands and clay deposits; Mineralogy of New Hampshire sands; New Hampshire till types; Mapping of the surficial deposits of the Winnipesaukee and Wolfeboro quadrangles. *Publication:* Geology of the Mount Washington quadrangle.

Water Resources.—*Projects:* Continuation of ground-water studies; Cooperative project on Hatchery water supplies.

NEW MEXICO

Organization.—New Mexico Bureau of Mines and Mineral Resources, Socorro, Dr. E. C. Anderson, Director.

Basic and Economic Geology.—*Projects:* Geology of the Gran Quivira quadrangle; Geology of the Cerro Venado and southern Chupadera Mesa areas; Preliminary report on oil field corrosion in southeastern New Mexico; Engineering and production data for Eddy County oil fields; Mineral resources of Colfax County; Examination and sampling of perlite, pumice and clay deposits. *Publications:* Building blocks from natural lightweight materials of New Mexico (*Bur. Mines Bull. 24*); Fluorspar resources of New Mexico (*Bur. Mines Bull. 21*); Mica deposits of the Petaca district, Rio Arraba County (*Bur. Mines Bull. 25*); Future oil possibilities of New Mexico (*Bur. Mines Cir. 12*); Subsurface geology of Quay County (USGS Oil and Gas Prelim. Chart).

NEW YORK

Organization.—New York State Science Service, Office of the State Geologist, Albany, Dr. J. G. Broughton, Assistant State Geologist.

Basic and Economic Geology.—*Projects:* Geology of the Fort Ann quadrangle; Map of depth to Pre-Cambrian basement; Map of oil fields under flood; Magnetic survey of Adirondacks; Economic geology of Lockport dolomite. *Publications:* Subaqueous mud cracks formed by settling; Ordovician cephalopods of the Cincinnati region; A new lower Chemung crinoid; The Clinton of western and central New York; Ice contacts and the melting of ice below a water level; Kame complexes and perforation deposits; Future possibilities for oil and gas in New York

State; An example of the development of cleavages.

NEVADA

Organization.—Nevada State Bureau of Mines, Reno, Jay A. Carpenter, Director.

Basic and Economic Geology.—*Projects:* Geologic and mining bulletins. *Publication:* Bibliography of geologic maps of Nevada areas.

NORTH CAROLINA

Organization. — North Carolina Department of Conservation and Development, Mineral Resources Division, Dr. Jasper L. Stuckey, State Geologist.

Basic and Economic Geology.—*Projects:* Review of mineral industry 1935-1945; Oil possibilities in the Coastal Plain; Exploration of Deep River coal field; Limestones of the Coastal Plain; Light-weight aggregate resources of North Carolina; Pegmatite resources of the Bryson City area; Vermiculite reserves of Macon County; Talc deposits of North Carolina; Economic geology of the Asheville area; Physical characteristics of sheet mica. *Publications:* Residual kaolin deposits of the Spruce Pine district (*Bull. 48*); Mica deposits of the Franklin-Sylva district (*Bull. 49*); The Vermuculite deposits of North Carolina (*Bull. 50*); The occurrence of sillimanite in North Carolina (*I.C. 4*).

Water Resources. — *Projects:* Ground-water survey of North Carolina. *Publication:* Ground Water in the Halifax area (*Bull. 51*).

Topographic and Planimetric Mapping. — *Project:* Chapel Hill quadrangle.

Others.—*Publication:* Mineral raw materials for roofing manufacture (*R.I. 2*).

NORTH DAKOTA

Organization.—North Dakota Geological Survey, Grand Forks, Dr. Wilson M. Laird, State Geologist.

Basic and Economic Geology.—*Projects:* Geology of the Oberon quadrangle; Geology of the Flora quadrangle; Geology of the Maddock quadrangle; Geology of the cement rocks and limestone of North Dakota; Study of clays for insecticide bases; Geology of the White River formation; Study of Lake Agassiz; Geology of the Kelly Slough area. *Publication:* The Keene Dome, Northeast McKenzie County, Part I, The Subsurface stratigraphy of the Nesson anticline, Part II (*Bull. 21*).

Water Resources. — *Projects:* Ground-water studies at the following municipalities: Aneta, Beulah, Buxton, Fargo, Fessenden, Hope, Kindred, Maddock, Michigan, Minnewaukan, Portland, Sharon, Wilton, Wimbledon and Zeeland; County studies of Wells and Benson Counties; Observation well program. *Publications:* Ground water in the Fessenden area (*N. D. Ground Water Studies No. 1*); Ground water in beach deposits of glacial Lake Agassiz near Mountain, North Dakota (*N. D. Ground Water Studies No. 2*). All ground-water work done in cooperation with the State Water Conservation Commission and the United States Geological Survey.

OHIO

Organization. — Geological Survey of Ohio, Columbus 10, Dr. George W. White, State Geologist.

Basic and Economic Geology.—*Projects:* Monongahela formation; Coshocton County; Perry County; Lucas County; Holmes County; Collection of oil and gas well samples and examination; Coal outcrop maps; Limestones of eastern Ohio; Sharon conglomerate and sandstone; Industrial minerals maps. *Publications:* Iron ore bearing formations of Ohio (*Bull. 45*); Occurrence of flint in Ohio (*Bull. 46*); Ohio mineral resources—revised (*I.C. 1*); Salt reserves; Geologic interpretation of scenic features in Ohio (*R.S. 3*).

OKLAHOMA

Organization. — Oklahoma Geological Survey, Norman, Robert H. Dott, Director.

Basic and Economic Geology.—*Projects:* Geology and mineral resources of Tulsa County; Subsurface structure map of Oklahoma; Geology and fuel resources of Le Flore and Haskell Counties; Titianiferous magnetite in Wichita Mountains; Mapping, sampling and analysis of high grade dolomites of Arbuckle Mountains; Woolrock; Testing ceramic clay; Bloating properties of Oklahoma volcanic ash and volcanic tuff; Oil field brines; Ceramic properties of decomposed gabbro. *Publications:* Guidebook on mineral resources field trip in Wichita Mountains; Mineral resources field trip Ada district.

Water Resources.—*Projects:* Geology and ground-water resources of Beaver, Grady, Ottawa Counties; Ground-water resources of the alluvium of North Canadian valley; Municipal supplies; Observation well program; Quality of water.

Others. — *Projects:* Cooperation with Ardmore and Oklahoma City Geological Societies in leading field trips; Oklahoma Mineral Industries Conference. *Publications:* Oklahoma needs industries; The Hopper—twelve issues per year.

OREGON

Organization.—Oregon State Department of Geology and Mineral Resources, Portland, F. W. Libbey, Director.

Basic and Economic Geology.—*Projects:* Geology of Dallas quadrangle; Microscopic examination of microfossils in long range project; Geologic mapping of Morning mine area in eastern Oregon; Progress examinations and file reports on Coos Bay coal field and Wilhoit coal mine; Investigation of mineral deposits in Curry County; Investigation of mineral deposits in Ashwood area, Jefferson County; Investigation of perlite deposits, Wasco County; Investigation of saline deposits, Lake County; Blending tests on Oregon clays. *Publications:* Geology of the St. Helens quadrangle; Reconnaissance geology of the limestone deposits in Willamette Valley; Geologic map of St. Helens quadrangle; Mineral locations map of the State of Oregon; Notes on building block materials of eastern Oregon.

PENNSYLVANIA

Organization. — Topographic and Geologic Survey, Department of Internal Affairs, Dr. R. W. Stone, State Geologist.

Basic and Economic Geology.—*Projects:* Geology and mineral resources of southeastern Clearfield County; Geology and mineral resources of Bucks County; Guidebook to the geology of the Philadelphia region; Quarter century of progress of the knowledge of the geology of Pennsylvania; Continuation of study of deep oil and gas sands; Oil and gas of the Warren and Sheffield quadrangles; Oil and gas of the Butler quadrangle; Oil and gas in the North Strabane area, Washington County; Detailed report of oil and gas sands of southwestern Pennsylvania; Oil and gas developments of Kinzua, Kane and Mt. Jewett quadrangles; Coring projects in Butter and McKean Counties; Bituminous coal strippings; Study of the brown iron ores; Study of high-alumina clay. *Publications:* Iron-manganese ore deposit at White Rocks, Cumberland County, Pennsylvania; Oil and gas field property line maps of the Titusville quadrangle; Anthracite reserves of Pennsylvania; Map of the undrilled areas of the Sheffield quadrangle.

Water Resources.—*Projects:* Intensive study of the ground-water resources of the Philadelphia and Pittsburgh areas; Continuation of the gaging of observation wells.

Topographic and Planimetric Mapping. — *Projects:* Topographic quadrangles as follows: Accident, Avilton, Driftwood, Bitumen, Friendsville, Frostburg, Grantville, Hyner, Noytsville, Houtzdale. *Publications:* Topographic quadrangles as follows: Montrose and Leraysville.

RHODE ISLAND

Organization. — Mineral Resources Committee, Providence, Dr. Alonzo Quinn, Chairman.

Basic and Economic Geology.—*Projects:* Bedrock and glacial geology of the Georgiaville and North Scituate quadrangles. *Publication:* Bedrock and glacial geology of the Pawtucket quadrangle.

Water Resources. — *Publication:* Ground water of the Pawtucket quadrangle.

SOUTH CAROLINA

Organization.—South Carolina Geological Survey, Columbia 19, Dr. Stephen Taber, State Geologist.

SOUTH DAKOTA

Organization.—South Dakota State Geological Survey, Vermillion, Dr. E. P. Rothrock, State Geologist.

Basic and Economic Geology.—*Projects:* Magnetic map of South Dakota; Structural mapping in Missouri Valley; Gravel survey in the White River Valley. *Publications:* Magnetic map and report on South Dakota; Structure in the vicinity of Mobridge; Gravels of the White River Valley; Topography of the low-lying area across the Missouri-James basin divide in Hyde and Hand Counties (*R.I. 51*); Pre-Cambrian geology of the Galena-Roubaix district, Black Hills, South Dakota (*R.I. 52*); Geology of the Missouri Valley in South Dakota (*R.I. 53*); The surface of a portion of the James basin in South Dakota (*R.I. 54*).

Water Resources.—*Projects:* Cooperative stream gaging with the United States Geological Survey; Medicinal waters of South Dakota; Fluctuation of water level in lakes and wells. *Publication:* Water supply for Sioux Falls.

Topographic and Planimetric Mapping. — *Publication:* Landmark map of South Dakota.

TENNESSEE

Organization.—Tennessee Division of Geology, Nashville 3, H. B. Burwell, State Geologist and Director.

Basic and Economic Geology.—*Projects:* Geologic mapping of the Great Smoky National Park area; Geologic mapping in west Tennessee; Economic study of the limestones of Tennessee; Mapping phosphate reserves of Tennessee; Subsurface stratigraphy and structure throughout Tennessee. *Publications:* Barite, Fluorite, Galena, Sphalerite veins of central Tennessee (*Bull. 51*); Geology of Nashville (*Bull. 53*); Geology and Mineral deposits of Bumpass Cove, Unicoi and Washington Counties (*Bull. 54*); Celestite deposits of central Tennessee (*Res. Tenn. No. 1*); Geologic map of the Mascot-Jefferson City zinc area, Tennessee.

Water Resources. — *Project:* Stream gaging in cooperation with the United States Geological Survey.

TEXAS

Organization. — Bureau of Economic Geology, University of Texas, Austin, Dr. John T. Lonsdale, Director.

Basic and Economic Geology.—*Projects:* Geology of the Christmas Mountains; Catalogue of Cretaceous Foraminifera; Geologic surveys in Trans Pecos, Texas; Geology of Gillespie and Blanco Counties; Pleistocene deposits of High Plains; Carboniferous rocks of the Llano region; Ellenburger group in central Texas; Structural map of Texas revised; Mineral resources of the Trinity River tributary area; High grade clay in Cisco group, north Texas; High grade clay in east Texas; Glass and industrial sands in north Texas; Rustler Springs sulphur deposits as a source of fertilizer. *Publications:* Contributions to Geology 1944 (*Pub. 4401*); Texas mineral resources (*Pub. 4301*); Rustler Springs sulphur deposits as a source of fertilizer (*R.I. 1*); Structural map of Texas (*Third ed.*); Oil, gas and sistillate field map of Texas.

VERMONT

Organization. — Vermont Geological Survey, Burlington, Dr. E. C. Jacobs, State Geologist and Curator of State Cabinet.

Basic and Economic Geology.—*Projects:* Areal mapping of two quadrangles.

Topographic and Planimetric Mapping. — *Publications:* Sushan, Hoosick Falls quadrangles.

Others. — *Publication:* Report of

the Vermont State Geologist for 1945-46.

VIRGINIA

Organization. — Geological Survey Division of Virginia Conservation Commission, Charlottesville, Dr. Arthur Bevan, State Geologist.

Basic and Economic Geology.— *Projects:* Geology and mineral resources of Clarke and Frederick Counties; Outline of geology and mineral resources of Augusta County; Geology of the Hot Springs district; Geology of Shenandoah National Park and environs; Geology of Virginia state parks; Common rocks and minerals of Virginia; Geology and mineral resources of Abington quadrangle; Geology and mineral resources of Buena Vista quadrangle; Geology and mineral resources of Lovingston quadrangle; Geology and mineral resources of Lynchburg quadrangle; Geology and mineral resources of Vesuvius quadrangle; Guidebook to the Lee Highway; Guidebook to U. S. route 250; A foraminiferal fauna from the Nanjemoy formation in eastern Virginia; Geology and petroleum resources of Lee County; Northeast piedmont zinc district; Gossan lead district; Industrial limestones and dolomites of Virginia; Mica deposits; Piedmont marble belt. *Publication:* An upper Eocene foraminiferal fauna from deep wells in York County, Virginia (*Bull. 67*).

Water Resources.—*Projects:* Artificial recharge in a brackish water well; Geology and ground-water resources of the York-James peninsula; Geology and ground-water resources of the northern Coastal Plain region. *Publications:* Chemical character of ground water in the Coastal Plain of Virginia (*R.S. 13*); Genesis of ground waters in the Coastal Plain of Virginia (*Econ. Geol.*).

Topographic and Planimetric Mapping. — *Projects:* The following topographic quadrangles: Boone Mill, Broadway, Callaghan, Clifton Forge, Craigs Creek, Dillon Mill, Edinburg, Goshen, New Canton, Parnasssus, Peaks of Otter, Pounding Mill, Radford, Staunton, Strasburg.

WASHINGTON

Organization. — Division of Mines and Geology, Olympia, Sheldon L. Glover, Supervisor.

Basic and Economic Geology.— *Projects:* Collecting and supplying economic information; Aid to exploration companies; Aid to prospectors; Area study of ultrabasic rocks and ore deposits; Salines, pumice, and pumicite. *Publications:* 1946 directory of mining operations (*I.C. 12*); Pumice and pumicite occurrences of Washington (*R.I. 15*).

Topographic and Planimetric Mapping. — *Projects:* Cooperative work on two quadrangles.

WEST VIRGINIA

Organization. — West Virginia Geological and Economic Survey, Morgantown, Dr. Paul H. Price, State Geologist.

Basic and Economic Geology.— *Projects:* Geologic gazetteer; Studies on acidizing Big Lime; Gas analysis; Oriskany structure map of the State; Surface tension studies on Appalachian oils; Clays of West Virginia; West Virginia brines. *Publication:* Well sample records (*Vol. XVII*).

Water Resources. — *Projects:* Ground-water studies at Wheeling airport; Parkersburg; Springs study.

Others. — *Projects:* Spectographic analysis of coal ash; Well sample studies. *Publications:* The fuel situation in western Europe; Geologist's place in service; Mineral resources of West Virginia; Evolution of geologic thought in prospecting for oil and natural gas.

WISCONSIN

Organization.—Wisconsin Geological Survey, Madison, E. F. Bean, State Geologist.

Basic and Economic Geology.— *Projects:* Lead and zinc investigations in southwestern Wisconsin.

Water Resources. — *Projects:* Ground-water surveys in widely scattered areas.

Topographic and Planimetric Mapping.—*Projects:* Aerial and topographic mapping. *Publications:* The following topographic quadrangles: Bayfield, Cornucopia, Marengo, Namekagon Lake, Odanah, Port Wing.

Others.—*Projects:* Soil Surveys in Langlade and Barron Counties.

WYOMING

Organization. — Geological Survey of Wyoming, Laramie, Dr. H. D. Thomas, State Geologist.

Basic and Economic Geology.—*Projects:* Pre-Cambrian geology of the Laramie Mountains; Geology of the Reshaw hills, Platte County; Bibliography of Wyoming geology; Geology of the Strong mine; Vanadium in Wyoming Paleozoic oils; Phosphate rock in the Lander area, Fremont County; Talc deposits in the Wheatland area; Cordierite in the Laramie Mountains. *Publications:* Geology of the northwestern Wind River Mountains, Wyoming (*Bull. 36*); Geology of the bentonite deposits near Casper, Natrona County (*Bull. 37*); Stratigraphic sections of Mesozoic rocks in central Wyoming (*R.I. 3*).

Water Resources. — *Projects:* Glendo municipal water supply; Ranchester municipal water supply; Como Bluff State fish hatchery water supply.

RECLAMATION AND IRRIGATION

By Michael W. Straus

Commissioner, Bureau of Reclamation, Department of the Interior

---

GENERAL

Works constructed by the Bureau of Reclamation, at the end of the fiscal year June 30, 1946, were bringing a full or a supplemental supply of irrigation water to 5,013,128 acres of land in the western states in which the Bureau functions. Of this total, 2,437,046 acres could receive a full supply of water from Bureau projects. This latter land was once desert, or in sagebrush, or dry farmed, and has been wholly reclaimed by works of the Bureau.

A summary of construction by the Bureau in the 44 years since it has been in operation, shows that the Bureau has built 100 storage dams and 68 diversion dams, with a reservoir capacity behind these dams of 67,897,248 acre-feet. The Bureau has also built 219,670 canal structures totaling 15,325 miles in length, and 335 tunnels running to a total of 566,521 feet. It has also laid nearly 13,000,000 feet of pipe, and nearly 1,000,000 feet of flumes.

CROPS ON RECLAMATION PROJECTS

Crops produced on 4,195,732 acres of Bureau project lands that were under cultivation during the calendar year 1945, reached a total gross value of 435,184,395. This total was achieved despite the handicaps of an uncertain labor supply, scarcity of machinery and parts, and inadequate transportation and marketing facilities. The average gross value per acre was $103.72.

Fruit was the most valuable single class of crop grown on project lands. The fruit crop in 1945 exceeded $77,717,000 in gross value. Alfalfa hay followed with a gross value of more than $64,542,000. Vegetables and sugar beets also assumed sizable proportions in gross values.

In terms of quantity, the food and forage crops on cultivated Bureau project lands totaled 11,814,337 tons, an increase of 445,341 tons over the amount reported for the previous year. The quantities for the individual crops fluctuated as compared with the previous year, but the record of 901,983 tons of fruit was 173,488 tons more than for the year before. Truck crops accounted for more than 46,000,000 bushels of the total produced, and grains, more than 36,000,000 bushels. Nearly 2,500,000 tons of sugar beets are included, and 180,760 bales of cotton.

The largest portion of the land—

24.9 per cent—was planted to alfalfa hay. Grain crops, with 20 per cent. ranked next. Fruit and nuts took only 3.3 per cent of the land under cultivation.

LAND OPENINGS—VETERANS' SETTLEMENT

As soon as possible after the end of the war, the Bureau of Reclamation inaugurated its peacetime construction program, designed to make the greatest number of farms and homes available for settlement by war veterans. Honorably discharged veterans of the Second World War were given first claim on new lands to be homesteaded as provided by Congress.

In view of the time-consuming planning and construction operations necessary to bring lands under irrigation, the amount of land made available during the first year after the fall of Japan was small, but it will grow as the program gathers momentum.

The first post-war opening of homestead lands announced in mid-1946. made available for settlement 7,527 acres on the Tule Lake Division of the Klamath project in California. The tract was divided into 86 farm units, varying from 70 to 80 acres in extent. Nearly 13,000 persons made inquiry and more than 2,000 persons filed applications for these farms.

A local examining board recommended to the Secretary of the Interior qualifications which entrymen must meet, and after eliminating those who do not meet these minimum requirements of experience, capital, industry, health, and character. the successful applicants are selected by lot from the remainder.

A second public notice announced the opening to homestead entry of 7,720 acres of public land on the Heart Mountain Division of the Shoshone project in northern Wyoming. This tract was divided into 83 farm units of varying size. Three more land openings for homesteading of 5,372 acres on three projects in the states of Washington and Idaho were scheduled.

In addition to public land openings, work is proceeding on the Columbia Basin project in central Washington. Water will be available to approximately 6,000 acres of this land in 1947, although the bulk of it must await completion of the distribution system to take water out of Franklin D. Roosevelt Lake. The government is acquiring this land at dry-land appraised values for resale in small, family-sized irrigated farms when water becomes available.

MISSOURI RIVER BASIN

The Bureau in 1946 began its part of the construction in the vast Missouri River Basin development. This program contemplates bringing irrigation water to 4,760,000 acres of land that are not now irrigated, and to 500,000 acres of additional land that are now insufficiently supplied with water.

The development, undertaken by the Bureau jointly with the Corps of Engineers, U. S. Army, involves construction of more than 100 new dams, 150 irrigation projects containing thousands of miles of canals and other facilities, 21 power plants, and the provision of safe water supplies for at least 19 communities. Montana, Wyoming, Colorado, North and South Dakota, Nebraska, Kansas, Iowa, and Missouri will benefit directly from the development.

Two dams are now under construction in the Basin by the Bureau—Kortes Dam and Power Plant, on the North Platte River, 60 miles southwest of Casper, Wyo., and Angostura Dam, on the Cheyenne River, nine miles south of Hot Springs, S. D.

Kortes Dam and Power Plant will be a concrete gravity structure, 440 feet long at the top, with a maximum height of 200 feet above the river bed. The dam will be for production of power only. The power plant, to be located at the toe of the dam, will have a generating capacity of 36.000 kilowatts, provided by three 12,000-kilowatt generators.

Angostura Dam will also be a gravity type concrete structure, extending from the left abutment across the river channel and an earth embankment extending along the right abutment. The dam will have total length at its top of 1,900 feet, and a maximum height above the river bed of 150 feet. The reservoir will have a storage capacity of 220,000 acre-feet, including 60,000 acre-feet of super storage for flood control. Water from the reservoir will irrigate about 16,000 acres of land.

Work on highway and railway relocation and camp construction is under way in preparation for starting the construction of Boysen Dam, the third unit in the program of the Bureau for the Missouri Basin. The dam will be located in Fremont County, Wyoming, on the Big Horn River. The reservoir will have a storage capacity of 820,000 acre-feet. A power plant at the dam will have an installed capacity of 15,000 kilowatts.

POWER AND RECLAMATION

The Bureau has on its projects 32 power plants distributed through most of the western states in which the Bureau operates. These plants have a total installed capacity of 2,362,800 kilowatts, which in the fiscal year 1946 produced over 12,000,000,000 kilowatt-hours of energy. The Bureau also operates more than 2,500 miles of transmission lines, of various voltages, to carry the power to market centers.

Under construction by the Bureau, or by the Army Corps of Engineers, whose power output will be marketed by the Bureau, are 12 or more power plants, which will ultimately add 1,325,600 kilowatts of installed capacity, and authorized, though not yet under construction, are 20 additional plants, with an additional capacity of 1,236,700 kilowatts. When the present program is completely realized, the total installed capacity of all power plants will be more than 6,900,000 kilowatts.

Power is now more than ever a necessary concomitant to the work of irrigation. Revenues from power sales not only defray power costs, but also make possible, financially, irrigation projects that otherwise would not be economically feasible. Again, the availability of power on the farm has brought increased production with less effort on the part of the farmer, and in the farm home, it has meant the conveniences of the city. At the low rates at which Reclamation power is usually sold, farmers have not been slow in availing themselves of it. Availability of power has also made industrial development possible, and has helped build communities which in turn have provided markets for much of the crops that are produced.

GRAND COULEE

Grand Coulee Dam and Power Plant, the key feature of the Columbia Basin project that ultimately will bring water to more than 1,000,000 acres of land in the Pacific Northwest, is rapidly being brought to completion. Three more 108,000-kilowatt generators are being installed in the left power house, to make a total of nine such generators in that power house. Three more generators of the same capacity have been ordered for the right power house, the first of nine that will be installed there. The total installed capacity at Grand Coulee when all generators are in service will be 2,190,000 kilowatts.

Six of the largest water pumps ever designed have been ordered, and six more will be ordered, which together will lift 7,000,000 gallons of water per minute from Franklin D. Roosevelt Lake, the reservoir behind Grand Coulee Dam, to an equalizing reservoir 280 feet higher than the lake. From there it will flow by gravity to create new farms to be settled by veterans and others on lands now largely arid.

DAMS UNDER CONSTRUCTION

Anderson Ranch Dam, on the South Fork of the Boise River, 40 miles southeast of Boise, Idaho, will be the highest earth-fill dam in the world, rising 444 feet above bedrock. It will be 1,350 feet long at its top. The reservoir will have a capacity of nearly 500,000 acre-feet of water, and will provide storage for irrigation, flood control, silt retention, and power production. The power plant at the dam will have an installed capacity of 27,000 kilowatts, with provision for an additional unit of 13,500 kilowatts.

Cascade Dam, on the North Fork of the Payette River, near the town of Cascade, Idaho, will be an earth and rock-fill dam, 800 feet long at the top, and 90 feet high. The reservoir will have a capacity of 700,000 acre-feet, and will provide storage for irrigation and flood control.

Davis Dam, on the Colorado River, 35 miles west of Kingman, Ariz., will be an earth and rock-fill structure, 1,600 feet long at the top, and rising 138 feet above the stream bed. The reservoir will have a capacity of 1,820,000 acre-feet, and will provide storage for irrigation, flood control, and power production. The power plant will have an installed capacity of 225,000 kilowatts, provided by five 45,000-kilowatt generators. This is the dam for which the Bureau awarded its largest contract during the fiscal year ended June 30, 1946—$21,462,505.

Horsetooth Reservoir, located approximately five miles west of Fort Collins, Col., will be formed by the construction of four earth-fill dams and Satanka Dike. The reservoir will provide storage for surplus waters of the Colorado River, diverted from the western slope of the Rocky Mountains through the Alva B. Adams Tunnel under the Continental Divide, to supply water for the water-deficient lands on the eastern slope.

Granby Dam, on the Colorado River about five miles northeast of Granby, Col., will be an earth-fill structure, 885 feet long at its crest, and rising 232 feet above the bed of the river. The reservoir will provide storage for more than 482,000 acre-feet of water.

South Coulee Dam, located near Coulee City, Wash., will be a two-mile long earth and rock-fill structure, and will form the south end of a huge irrigation reservoir in the Grand Coulee, the ice-age bed of the Columbia River. This dam, and the North Coulee, when built, will create an artificial lake, or storage basin, 27 miles long. This will be the equalizing reservoir into which the six huge pumps that have been ordered, and the six additional pumps that will be ordered, will lift water from Franklin D. Roosevelt Lake, 280 feet below the reservoir.

Potholes Dam, located on Crab Creek about 15 miles west of Warden, Wash., will be approximately 19,000 feet of continuous earth embankment varying in height up to 200 feet and extending across several depressions in the Crab Creek Basin. It will be the fourth longest dam in the United States and will have a gross storage capacity of 615.000 acre-feet.

Long Lake Dam, situated in the Long Lake Basin about 2½ miles northeast of Stratford, Wash., will be an earth and rock-fill dam 1,900 feet long, rising 111 feet above the stream bed. The reservoir formed by this dam will have a capacity of more than 62,000 acre-feet.

AQUEDUCTS, TUNNELS, CANALS

Salt Lake Aqueduct, on the Provo River project in Utah, will be 41 miles long and will tap Deer Creek Reservoir, on the Provo River about 16 miles northeast of Provo. It will provide water for industrial and domestic purposes in Salt Lake City, and also serve irrigation needs. The conduit, which consists of tunnels, sections of 69-inch inside diameter precast concrete pipeline and plate steel pipeline of various lengths, will have a capacity of 150 second-feet.

Duchesne Tunnel, on the Provo River project, about 30 miles northeast of Deer Creek Reservoir, will be six miles long, will divert water for irrigation purposes from the upper tributaries of the Duchesne River (Colorado River watershed) to the Provo River for storage in Deer Creek Reservoir. The tunnel will have a capacity of 375 cubic feet per second when unlined, and 600 feet per second when lined with concrete. It will be approximately 9 feet 3 inches in diameter, and will require permanent steel-rib liner supports and steel tunnel-liner plates in some places.

Rams Horn and Prospect Mountain Tunnels, on the Colorado-Big Thompson project in northern Colorado, will be 1.3 miles long, 10 feet in diameter, and will have a capacity of 550 second-feet. Prospect Mountain Tunnel, 1.1 mile long and 12½ feet in diameter, will have a capacity of 1,300 second-feet. The two tunnels, together with the 1.3-mile Aspen Creek Siphon, a 10-foot 9-inch diameter conduit connecting with the east end of the Alva B. Adams Tunnel, form a part of the Power Canal No. 1, which terminates at the Estes Park Power Plant, near Estes Park, Col.

Coachella Canal, a branch of the All-American Canal System, will be 145 miles long, and will serve the irrigation needs of approximately 75,000 acres of land in the Coachella Valley, Calif. The canal branches from the All-American Canal at a point approximately 18 miles east of Yuma, Ariz. and extends northwest as far as Indio, Calif. Approximately 84 miles of the Coachella Canal have been completed. The canal is designed for an initial capacity of 2,500 second-feet. It is 60 feet wide at the bottom, 124 feet wide at the top, and 16 feet deep at the section where it takes off from the All-American Canal.

Friant-Kern Canal, on the Central Valley project, California, will extend from Friant Dam to Bakersfield. This canal and the Madera Canal, which is 37 miles long and was completed in 1945, will carry water from Millerton Lake, the storage reservoir created by Friant Dam, to the fertile San Joaquin Valley. The Friant-Kern Canal will have a capacity of 4,000 second-feet. Approximately 73 miles of this canal are under construction.

Contra Costa Canal, on the Central Valley project, is almost complete. It will be 27 miles long. Industries in the Antioch-Pittsburg area in the Delta region of Central Valley were provided with water by means of this system during 1944. The canal has a capacity of 350 cubic feet per second.

Delta-Mendota Canal, on the Central Valley project, will be 120 miles long, with a diversion capacity of 4,600 second-feet. It will transport water along the west side of the San Joaquin Valley to Mendota pool. A 12.9-mile section of this canal near Patterson, Calif. and an additional 11-mile section near Tracy are under construction.

Bacon Tunnel, now being constructed on the Columbia Basin project in Washington, will be two miles long, and 23 feet in diameter.

Bacon Siphon, on the Columbia Basin project, will be 1,020 feet long, and 23 feet in diameter.

Columbia Basin Main Canal will transport water supplied from the Grand Coulee pumping plant through the Bacon Tunnel and Bacon Siphon. Portions of the canal now being constructed will have a carrying capacity of 9,700 second-feet of water and will vary in width from 95 to 200 feet at the top of the embankments. It will be from 20 to 48 feet deep.

SURVEYS AND INVESTIGATIONS

Surveys and investigations of 18 major river basins, the principal subbasins and many individual projects in 17 western states are being completed by the Bureau. The purpose of these studies is to measure the potentialities of the land and water resources of the regions, determine the engineering feasibility and economic soundness of project construction, and help in the preparation of a coordinated plan of development. Such a comprehensive report was presented to Congress on the Missouri River Basin, and was approved. Detailed surveys are now under way to perfect the plans on the units comprehended in the full Basin report.

Reports on the Colorado River Basin, Central Valley Basin, the Santa Barbara project in California, the Mountain Home project in Idaho, and the Paonia project in Colorado, have been prepared and are under review by the affected states and Federal agencies.

A report on the Lewiston Orchards project in Idaho has been completed, and Congress has authorized construction of the project.

FINANCES

To date Congress has appropriated $115,795,543 for the Bureau of Reclamation for the fiscal year ending June 30, 1947. Included in this sum is $113,610,803 appropriated in the Interior Department Appropriation Act, 1947, the largest regular annual appropriation ever made for the agency in the 44 years of its history. Later, Congress voted a supplemental appropriation of $2,184,740 for three separate projects. However, last August the President, as an anti-inflationary measure, and also as a measure to conserve materials, limited the put-in-place value of new construction to $85,000,000 for the current fiscal year. The Bureau of the Budget, after a review of the figures, the commitments and the needs, later raised the ceiling to $110,000,000.

This is considerably below the amount in work that the Bureau had scheduled for the year, but the Bureau will keep rigidly within the limitations set. These funds do not all come out of the taxpayers' pockets. A large part is repaid into the Federal Treasury over a period of years by water and power users. The cost of irrigation facilities actually in operation at the end of 1945 was about $352,000,000. Of this, more than $73,000,000 has already been repaid by water users under Reclamation Law. In addition, revenue received from hydropower users in 1945 alone totaled approximately $21,000,000.

CUMULATIVE BENEFITS

The benefits from water on the land brought by works of the Bureau of Reclamation are long range and cumulative. The cumulative total of crop values on lands irrigated from construction by the Bureau from 1906 to the end of the calendar year 1945, was almost $4,500,000,000. A total of over 90,000 irrigated farms was reported for 1945 on all Reclamation projects. The population on these farms totaled 350,000, representing an increase of 1.6 per cent for the year. Towns on or adjacent to the projects increased 3.5 per cent in population during the year. The census at the end of 1945 showed 1,050 schools, 1,429 churches, and 146 banks serving the residents of the project farms and the adjacent towns.

The inventory of livestock on project farms, as of Nov. 1, 1945, disclosed a total value of more than $67,000,000, and motor vehicles and farm equipment on hand at that time were given a value of nearly $62,500,000.

PUBLIC LANDS

By Fred W. Johnson

Acting Director, Bureau of Land Management,
Department of the Interior[1]

GENERAL

Reconversion from war to peacetime use of the public lands of the United States and their natural resources was the major undertaking of the General Land Office during the 1946 fiscal year. The transition from providing millions of acres of land for troop training, bombing range, tank maneuvering, and other military uses to a program affording postwar opportunities for settlement on public domain areas, particularly in

---

[1] On July 16, 1946, the General Land Office was consolidated with the Grazing Service to become the Bureau of Land Management in the Department of the Interior. The positions of Commissioner and Assistant Commissioner of the General Land Office were abolished and top level authority vested in a Director and Associate Director of the Bureau of Land Management. The Supervisor of Surveys in the General Land Office was also abolished and the responsibilities of that position were vested in the Chief Cadastral Engineer in the Bureau of Land Management. In the District Land Offices the position of Register was abolished, and the designation of Manager was given to the head of each office. Mr. Johnson was named Acting Director of the new Bureau.

Alaska, was well under way at the close of the fiscal period.

Rapid progress also had been made in a similar re-channeling of the tons of minerals, millions of gallons of petroleum products, and millions of board feet of timber and other forest products from military purposes to meet the requirements of a stabilized post-war industrial economy. At the same time satisfactory progress was made in formulating plans to clear away the accumulation of land administration problems which for the past five years have been dammed up behind emergency exigencies of the military program. More than 100,000 cases involving land administration problems of essential, though not of such urgent importance as to demand immediate attention in the midst of the military program, were conservatively estimated to form part of the year's work, while a backlog of responsibility involving the survey or resurvey of more than 100,000,000 acres of public land—projects already authorized but laid aside for immediate war-connected survey tasks—remained on the General Land Office books.

REVENUE PRODUCING AGENCY

For many years the General Land Office has been one of the few agencies of the Federal Government whose operations have resulted in revenues in excess of the cost of administration. In the 1946 fiscal year total receipts from its activities amounted to $13,104,067, and expenditures out of appropriations of only $2,822,662. This surplus of receipts over expenditures represents a ratio of $4.64 in revenue for every dollar spent on the operation of the Office.

REORGANIZATION

Definite steps toward streamlining the work of the General Land Office to meet the new and increasing responsibilities of the post-war era were taken near the close of the fiscal year. In May 1946, President Truman submitted to Congress Reorganization Plan No. 3, which provided for a consolidation of the General Land Office and the Grazing Service in the Department of the Interior into a new Bureau of Land Management. Details of the management of the General Land Office structure and procedures were brought close to completion by the end of the fiscal year, thus paving the way for early effectiveness of the President's program to remove unnecessary duplication in land administration activities and insure maximum efficiency in transaction of the Government's business in the public interest.

Meantime, the establishment of the Bureau of Land Management marked the termination as a separate identity of one of the oldest agencies in the Federal Government. It also opened a new chapter in the history of public land administration in the United States which had its inception with the beginning of the Republic itself, and in all of which, with the exception of its earliest beginning, the General Land Office, first established as a Bureau in the Treasury Department in 1812, had played a direct part.

Chronologically, Federal land administration began with the Ordinance of 1785, largely sponsored by George Washington and Thomas Jefferson, under which the Continental Congress directed that identification of land in the new Republic should be undertaken on the standardized pattern of townships six miles square. Thereafter, disposal of the public lands in accordance with the survey system was carried out by the Treasury.

In 1812 the General Land Office was set up as a Bureau in the Treasury Department for the handling of administrative matters involving the public domain, and when the Interior Department was established in 1849, the General Land Office was transferred to that Department. Throughout the 97 years which followed, the Office, serving in its capacity as official real estate agent of the Government, played a striking role in the advancement of American civilization westward to the Pacific. Making government land available for settlers for the construction of transcontinental railroads, mineral development, and other activities, the volume and rapidity of Office operations at one time led to the coining of the popular phrase, "doing a land office business."

Meantime, the Congress carried forward a systematic enactment of new laws affecting the administration of the Federal public domain until today the body of public land law is made up of more than 5,000 statutes which serve as the basis for adjudicative and administrative procedures.

DEVELOPMENT OF ALASKA

More than 90 per cent of the Territory of Alaska consists of vacant public land whose disposal or the development of its natural resources under the public land laws is a direct responsibility of the General Land Office. Consequently, plans for the future maximum beneficial use of the public domain areas in Alaska formed an important part of the work program of the Office during the 1946 fiscal year.

Stimulated by a public interest in the Territory greater than ever before in recent years, demands for information concerning living conditions and opportunities in Alaska at times literally swamped the facilities of the Office directly engaged in public land administration in the Territory. Thousands of ex-service personnel and other potential travelers over the newly completed Alaska Highway, were furnished with informational material prepared by the General Land Office during the year.

At the same time, definite steps were taken to promote economic development and wider utilization of public domain areas in the Territory. Special field parties of land experts were sent to Alaska during the year to ascertain and evaluate the possibilities for increased agricultural settlement in the Territory; and other measures, looking to maximum land use, were set under way.

Construction of the Alaska Highway, affording an overland route from the United States into the Territory, was an outstanding achievement in connection with the prosecution of the Second World War. When construction of the highway was begun, a strip of land ten miles wide on each side of the road's proposed route was withdrawn from general public use, thus removing approximately 8,300,000 acres of public domain which otherwise would have been susceptible of utilization in the development of the mineral and other natural resources in the Territory. The withdrawals were made with the intention on the part of the Department of the Interior that the areas would be restored to general public use as soon as the need for their use under the military program ceased. Accordingly, arrangements had been brought near completion at the end of the fiscal year for a reduction in the size of the withdrawals and the retention of merely a small right-of-way strip along the highway, thus restoring large areas of the Federal domain to public use.

Similar action was taken shortly after the close of the fiscal year in connection with more than 18,600,000 acres located on the Alaska and Kenai peninsulas originally set aside for the development of possible petroleum supplies for the Armed Forces in the Territory during the war.

SURVEYING THE PUBLIC LANDS

Because no tract of land properly may be set aside for any use until its location and boundaries have been accurately determined and permanently recorded, the Government's cadastral surveys have been the basic foundation in negotiations for the disposal, exchange, withdrawal or other change in the status of the public domain areas since 1786.

Differing from the type of survey work which involves primarily the recording of geographic or historical features of the terrain, cadastral surveying consists of careful measurement of the areas of land on the ground, the recording of such measurements by the placing of monuments or other markers, and the preparation of maps scientifically compiled from notes made by trained engineers at the time of the on-the-ground measurements. First undertaken by the General Land Office when the system of public land surveys decreed by the Continental Congress was transferred to its jurisdiction in 1812, maintenance of a Cadastral Engineering Service has been a continuing responsibility of this Office. During the 1946 fiscal year cadastral activities were carried on in 22 states and the Territory of Alaska, under 62 separate groups. A total of 7,950 miles was surveyed or resurveyed, embracing 1,125,557 acres.

DISTRICT LAND OFFICES

A record of nearly 150 years of uninterrupted service to the public in the administration of the Federal domain was established during the 1946 fiscal year by the network of district land offices maintained under the supervision of the General Land Office. Serving as the first point of contact with the thousands of settlers, who, through past generations sought new hearths and homes on the public lands, original "over the counter" transactions in these offices, in many instances, accompanied the development of the Republic westward to the Pacific.

With the establishment of the first district land office in Ohio in 1800, these outposts of land management spread throughout the West and reached a total of 393 offices at the height of the national public land disposal program. Whenever most of the Federal domain within a land district virtually had passed from the Government into private hands, the offices were closed and the land records transferred to the state authorities.

Today there are twenty-five district land offices located in 13 western states and the Territory of Alaska in which applications for use of the Federal land and its resources may be filed and other negotiations in connection with the public domain may be carried on in direct "over the counter" proceedings based upon more than a century of experience in these transactions.

FORESTRY MANAGEMENT AND OPERATIONS

Post-war requirement for an increased supply of timber from Federal lands was among outstanding problems confronting the Office and its adjudicating and administrative divisions during the year. Detailed plans were formulated for the inauguration of a sustained yield program of forest management on all public lands of the United States under which a safe balance of the volume of tree cutting and tree growing is maintained to insure a perpetual supply of raw material.

At the same time forestry operations on 2,500,000 acres of Federal land encompassed in the Oregon and California Revested Railroad grant areas resulted in the furnishing of more than 345,000,000 board feet of timber, most of which went to meet the nation's construction demands with a resultant revenue of more than $1,420,000 from the sales of these resources in the area. Maximum beneficial use of the supply of forest products on the public lands in Alaska was a problem confronting the Alaska Fire Control Service of the General Land Office during the fiscal year. This responsibility involved both timber management and the prevention and suppression of forest fires on the public domain areas in the Territory on more than 225,000,000 acres of forest, brushland, and other vegetative areas in the Territory. Of the 124,431 acres depleted by fire during the 1946 fiscal year, 38 per cent was caused by lightning, 18 per cent by smokers, and 30 per cent by debris burners and campers, and the remainder by other miscellaneous causes.

MISCELLANEOUS

Through its force of civil, mining and metallurgical engineers, geologists, lawyers, auditors, timber and range specialists and others experienced in land law procedure, the Branch of Field Examination carried forward a substantial program designed to insure its proper observance of the public land laws.

In the past fiscal year settlement made in 348 trespass cases resulted in the recovery of more than $44,000.

The disposal of grazing and mineral lands and certain other types of real property declared to be surplus upon the expiration of its value for military use, was undertaken by the General Land Office during the year. Up to June 30, 1946, 32 declarations of surplus property were placed under the jurisdiction of the Office; 20 of these involved property in continental United States valued at more than $53,600,000, while 12 declarations in Alaska had a total value of more than $23,700,000. The total of all such property placed with the Office for disposal during the fiscal year was more than $77,376,873.

PUBLIC UTILITIES

By H. M. Olmsted
Public Utility Engineer-Accountant

GENERAL

The first year after the end of the fighting in the Second World War confronted the public utility industries with the changing needs and conditions of an unsettled peacetime economy. Demands for service continued high, but for widely different purposes and from shifting sources. Restrictions on supply of equipment and construction materials presented difficulties but were eased during the course of the year. Higher costs of materials and labor developed, together with increased demands of various sorts by labor unions, culminating in strikes and cessation or reduction of operations in some instances.

Although wartime controls had been mostly removed by the end of 1945, somewhat similar restrictions were instituted in 1946 during the two nationwide coal strikes. In May, the Civilian Production Administration issued an order, applicable to the eastern half of the country, making mandatory the interchange of electric power and the maximum use of methods of power production other than by coal. The Federal Power Commission stimulated interconnections by declaring that those of a temporary nature, for the emergency, would not affect the status of electric utilities under the Federal Power Act.

In November and early December, when the coal miners were again on strike, the CPA once more directed the interchange of electric power and required limited curtailment of service by electric utilities in the East, and the FPC urged electric systems to utilize water power as much as possible and again waived jurisdiction during the coal crisis over companies making interconnections to save coal. The Solid Fuels Administration increased restrictions on distribution of existing coal stocks.

ELECTRIC LIGHT AND POWER

The coal shortage imperiled gas manufacturing companies even more than electric utilities. Demand for electrical energy, which took a precipitous drop after V-J Day in August, 1945 (much below 1943 and 1944), climbed rapidly after the middle of 1946, exceeded the corresponding periods of all the preceding three years by mid-September, and in November began a series of all-time records. Although interrupted in early December by the coal strike it reached a peak of 4,940,453,000 kilowatt-hours in the week ended Dec. 21. This was 7 per cent greater than the high point for any previous year, which was 4,616,975,000 kwh in the week ended Dec. 23, 1944.

At the year's end the Edison Electric Institute estimated that the total 1946 production of energy by all electric utilities, both privately and publicly owned, was substantially the same as in 1945, or about 222,500,000,-

000 kwh. Steam plants were credited with 143,000,000,000 kwh, an increase of 2,500,000,000 over 1945; hydro plants with 77,500,000,000 kwh, a decline of 2,500,000,000, and internal combustion engines produced about 2,000,000,000, as in 1945. Total sales were placed at about 191,000,000,000 kwh, a decline of about 1.3 per cent below 193,558,000,000, in 1945, but the year's revenues were estimated to have increased 3 per cent to $3,450,000,000, this rise being attributed to replacement of much wholesale industrial use by higher-paying commercial and residential service.

Nearly 2,000,000 new customers were reported to have been added in 1946, the majority being in rural areas. The total number of electrified farms was put at 3,400,000, an increase of over 500,000; the new total was said to comprise 63 per cent of all occupied farms.

The average residential consumption of electric energy attained a new high of 1,330 kwh per annum, according to the EEI, this being an increase of about 100 kwh over 1945, accompanied by a drop in the average cost per kwh to the residential consumer. New records of consumption were set for all classes of customers except industrial, which, however, held up remarkably in view of the cessation of war production.

Construction in the amount of $800,000,000 was reported during the year, largely for improving distribution lines and other facilities. Power plant construction was delayed considerably by equipment shortages, partly owing to strikes in metal production and electrical manufacturing industries. About 150,000 kilowatts of generating capacity were installed in the year, although 1,400,000 kw were reported to have been scheduled. It was announced that the electric companies plan to add about 8,500,000 kw of generating capacity in the next three years.

FEDERAL POWER COMMISSION

Relieved of some of its wartime functions in regulation of power in the interests of war production, the Federal Power Commission again concentrated on peacetime regulation of interstate electric and natural gas companies, as to construction, rates, service, accounting, etc. The extent of its jurisdiction continued to be a subject of some dispute on the part of state regulatory commissions and their national organization, the National Association of Railroad and Utilities Commissioners. On Nov. 4, in the Safe Harbor Water Power Corporation case, the FPC took the position that it has jurisdiction over rates that would otherwise be determined by agreement of state commissions, where inaction of the latter as to high rates indicates inability to agree. The NARUC had opposed the claim of the FPC to such jurisdiction. The Safe Harbor company was directed to reduce rates to a level calculated to yield a five per cent return on net investment (the depreciation reserve being deducted).

SECURITIES AND EXCHANGE COMMISSION

On April 1, 1946, the United States Supreme Court in the case of *North American Co.* vs. *Securities and Exchange Commission* upheld the constitutionality of the Holding Company Act as to its requirement of integrated systems and divestment of other holdings (Section 11 [b] [1]) and, without passing directly on the provision for dissolution of subsidiary holding companies (Section 11 [b] [2]), stated that it applies to holding companies engaged in interstate commerce. The North American Co., which at one time headed a system of 80 companies doing business in 17 states, was ordered by the SEC in 1942 to divest itself of all properties except the Union Electric Co. of Missouri, serving St. Louis and vicinity. The SEC was sustained by the Circuit Court of Appeals in 1943, but decision of the company's appeal to the Supreme Court had been delayed by lack of a quorum; some of the justices were unable to participate because of prior connection with the case in various official capacities. The final decision was 6 to 0.

In November, by another 6-0 verdict, the Court sustained the SEC's order directing the dissolution of the American Power and Light Co. and the Electric Power and Light Co., subholding companies of the Electric Bond & Share Co. system. Thus Section 11 [b] [2] of the Holding Company Act was upheld.

Despite the delay in the ultimate decision on the constitutionality of these provisions a great amount of geographical integration and corporate simplification of holding-company systems has taken place in recent years, with varying degrees of cooperation between the SEC and the companies; and according to Chairman James J. Caffrey, at the year's end, the integration and simplification program is proceeding toward rapid accomplishment. During the year the SEC approved nine plans submitted by public utility holding companies relating to the revamping of their systems.

TENNESSEE VALLEY AUTHORITY

In December, the Tennessee Valley Authority reported that, in the fiscal year ended June 30, 1946, it received $16,150,000 for 3,500,000,000 kwh of electrical energy sold to 92 municipalities and 46 cooperatives in the seven southern states served by its lines. This energy went to some 669,000 consumers, who paid $43,500,000, yielding net income of $8,200,000 to the distributing agencies after operating expenses, depreciation, interest, and also taxes or tax equivalents amounting to $2,179,000 paid to state and local governments. The number of ultimate consumers increased by 88,000 during the year, including 30,000 new rural consumers; 31 of the distributing agencies were reported to have reduced their rates by $850,000 per annum.

Residential use per customer averaged 1,903 kwh at an average price of 1.78 cents, compared to a nationwide residential average of about 3.3 cents per kwh. Total energy produced and sold, including supply for the Oak Ridge atomic energy plant, and other large-scale power users, which suffered a substantial drop after V-J Day, was exceeding wartime peaks by the latter part of 1946, being at the rate of 12,000,000,000 of kwh per annum. Total power revenues for the fiscal year, however, ($35,265,000) were about 10 per cent less than in the previous year.

Discussion and controversy over the proposal for a Missouri Valley Authority and, to a lesser extent, a Columbia Valley Authority, continued during 1946 without substantial progress toward those objectives being evident. Drastic slashes in funds for the Bonneville Power Administration, in Oregon and Washington, and various other Federal power undertakings, were made, followed by substantial restorations. The new Congress is expected to restrict public power development still more.

ATOMIC ENERGY

The engineering and economic possibilities of nuclear or atomic energy for electric power production were explored with increasing interest during 1946. Preparations for one so-called atomic power plant were under way at Oak Ridge, Tenn., the location of the main nuclear fission laboratories and other installations used in the war for production of atomic bombs. It was emphasized, however, that this plant is to be purely for research and experimental use; that it is merely at the design stage; that many problems must be solved before it can be constructed and operated; and that operation is not likely during 1947. The fundamental basis of the plant is the uranium "pile," the use of which for power purposes is a vastly different matter than the production of bombs.

In November it was announced that a second uranium pile for power purposes is planned for the Knolls Atomic Power Laboratory, to be built and operated for the Federal Government by the General Electric Co. at Schenectady, N. Y.

Estimates of atomic power plant costs were submitted to the United Nations by technicians of Oak Ridge and elsewhere, indicating that an atomic power plant of 75,000-kilowatt capacity could be built for $25,000,000, or about 2½ times the cost of a coal-fired steam-electric plant of that capacity, and that total production costs could be 8 mills per kwh, compared to 6.5 mills; however, these were on the basis, among other assumptions, of 3 per cent interest and 100 per cent load factor, which latter is far from a usual condition.

In October and November the *Electrical World* published a report prepared as a project of the Carnegie Endowment Committee on Atomic Energy, presenting further data and estimates concerning atomic power production, with comparison to coal-using methods. It purported to show an economic advantage for atomic power, assuming uranium at $10 a pound, over coal at $6 a ton, and with operation averaging 50 per cent of capacity. However, all such estimates are highly speculative, particularly as no atomic power plant has been finally designed, much less built, and many assumptions are used that may be wide of the mark, proof as to which will hardly be available for years to come.

Aside from availability and cost of uranium (or any possible substitute), which, together with its primary utilization, will be kept strictly in governmental control, and problems of harnessing its inherent energy for industrial power, there is the need not only of protection of the working force from the dangers of operation but also of the disposal of radioactive wastes so that the public will not be menaced.

Present research in atomic power is stated to be directed toward its correlation with existing power equipment and techniques. The chief items subject to displacement would be furnaces and boilers; turbines would not be affected so much, and generators, transformers, and transmission equipment would presumably be unaffected. Any effect on hydroelectric power would be similar in nature to that of steam power today. Thus atomic power does not as yet seem likely to produce as revolutionary changes in the electric power industry as might be popularly assumed.

GAS

Customers of gas utilities at the end of 1946 were reported by the American Gas Association at a new high level of 20,835,000, representing an increase of 2.7 per cent during the year. The number receiving natural gas was given as 9,401,000; those receiving manufactured gas, 8,793,000; and those served with mixed gas, 2,461,000. It was estimated that a further number of 3,000,000 consumers beyond the reach of gas mains used liquefied petroleum gas.

The revenues of the gas industry in 1946 were placed at $1,205,992,000, or about 4 per cent more than in 1945; the increase was primarily in residential and commercial use, industrial consumption remaining at about the previous year's level. Revenue from natural gas was stated as over $705,000,000, or 3.4 per cent over 1945; manufactured gas revenue was about $392,000,000, an increase of 5.6 per cent; and mixed gas brought in $109,000,000, up about 2.4 per cent.

Cubic feet of natural gas sold were given as 2,192,778,000,000, slightly more than in 1945; residential and commercial consumption increased materially. Manufactured gas sold amounted to some 412,053,000,000 cubic feet, an increase of 4.2 per cent; mixed gas was sold to the extent of 145,832,000,000 cubic feet, or 3.7 per cent over 1945. Residential and commercial sales of manufactured and mixed gas were reported to have increased 8 per cent. The number of homes heated by gas was stated to have increased 15 per cent.

The gas industry has continued an intensive program of research and promotion under the auspices of the AGA. Separate groups have concentrated on residential development and on commercial and industrial research, looking to new applications, apparatus and improvements.

Natural gas is now supplied in 33 states, by means of some 220,000 miles of trunk lines and mains. On Dec. 16, the Federal Power Commission announced that in the preceding 14 months it had authorized natural gas pipeline facilities in an aggregate amount of $193,576,000 and that 71 large cities and many smaller communities are thereby benefited; the additional gas thus made available was placed at more than 1,000,000,000 cubic feet a day. One line included was from Texas to California, a distance of 1,200 miles, with a capacity of 305,000,000 cubic feet a day; its cost was given as about $70,000,000.

Controversy over disposal and use of the government's "Big Inch" and "Little Big Inch" pipelines, built during the war to bring oil to the eastern seaboard, came to a head in December when the bituminous coal mines were on strike. Temporary use of the two lines for transmission of natural gas was arranged for by lease, with the distinct possibility that the use for that purpose would be continued.

The FPC concluded in July its hearings in the investigation of the natural gas industry that started in 1945. Its report thereon was expected by the spring of 1947.

TELEPHONE AND TELEGRAPH

The American Telephone & Telegraph Co. announced late in 1946 that in the first ten months of the year the Bell Telephone System had installed 5,000,000 telephones, representing a net increase of over 2,750,000 and bringing the total in service to 25,200,000 in October. Including 6,000 independent telephone companies the grand total for the United States was given as over 30,000,000 telephones. The Bell System reported 2,000,000 applications for service at the end of the year, and anticipated making substantial progress in taking care of them. At the end of the year the Civilian Production Administration dropped its restrictions on telephone installations, but because of the tremendous unfilled demand and the shortage of instruments and of central office and cable facilities the telephone companies expected to continue the system of preferences that had been in effect, whereby physicians, schools, essential industries, war veterans, etc., had various degrees of priority.

The A. T. & T. Co. asserted that more technological developments were introduced in 1946 than in any other year, including mobile telephone service, rural telephone service over electric power lines, radio telephone service for remote farms and ranches and inter-city transmission of regular television programs over coaxial cables. This company sold more than $560,000,000 of debentures and common stock in 1946 in its financial program for expansion.

The Western Union Telegraph Co., having a virtual monopoly in the telegraph industry but subject to effective competition of the telephone and the air mail, was granted a 10 per cent rate increase by the Federal Communications Commission and by most state commissions, and in October petitioned for a further increase. The company and the staff of the FCC have been carrying on a comprehensive investigation to develop a simplified and non-discriminatory rate structure.

Construction of a radio beam network for the simultaneous transmission of large numbers of telegraph messages has been considerably advanced.

TRANSIT

Local transportation continued a course of gradual replacement of worn-out equipment, made difficult by shortage of new vehicles and the pent-up demand. Some further substitution of buses for street-railway cars occurred, particularly in New York City, and there has been a distinct trend toward greater general use of trolley-buses. Traffic generally held up well despite loss of wartime industrial riding; in some localities prior records were equaled or exceeded.

The transition of the Chicago privately owned transit systems—surface and elevated—to a comprehensive municipal system, including subways, was nearly consummated in 1946. With Chicago there are 34 cities of all sizes in the United States owning some facilities for public transportation.

PITTSBURGH ELECTRIC UTILITY STRIKE

Pittsburgh, Pa., was the scene of the first large-scale electric utility strike affecting a metropolitan city. A preliminary strike took place on Feb. 12, 1946, lasting about 19 hours, on the part of the Independent Association of Duquesne Light Co. Employees, which demanded an immediate 20 per cent wage increase, with an additional 15 per cent to be arbitrated; the company offered 7½ per cent. The union was reported to have about 3,200 members in that company and its affiliates. When the strike occurred limited service was maintained by supervisory employees, but streetcar lines stopped and many coal mines closed. Steel mills were already strikebound. A three-man mediation board began hearings after the strike was called off. In April the union accepted an arbitration award of a general wage increase of 18 cents an hour, but indicated it would seek more on July 1 when negotiations could be resumed.

After long and unsuccessful negotiation another strike was announced to start Sept. 10. Just before its scheduled beginning, the city obtained a preliminary restraining order against disruption of service. At first the head of the union agreed to arbitrate, and a hearing on the restraining order was postponed to Sept. 24; but he changed his position, attacked the court's order, and at the hearing, after refusing to attempt to call off the second strike, which began that day, was held in contempt of court and sentenced to a year in jail. Thereupon Pittsburgh organized labor in general, which had not been especially sympathetic, indicated its support of the strike. On Sept. 26 the city sought and obtained dissolution of the injunction that had supplanted the restraining order, and the union president was freed. The strike continued for 27 days, and on Oct. 20 the union voted to accept arbitration. Although the strike had crippling effects it was not as disastrous as had been feared; a group of supervisory employees kept the electric system functioning at from 35 to 50 per cent of normal, and as much power as was generated at the company's plants was available from other utility and industrial plants in the area. It was estimated by business sources that 125,000 persons in offices, stores, and industry were made idle by the strike, and that loss of business and wages in the area came to $300,000,000. Street railways did not run until Oct. 14, when the AFL union operators decided to resume work despite picket lines.

GAS STRIKE IN NEW JERSEY

Potentially even more disastrous than electric strikes are tie-ups in the gas production and distribution industry, where continuity of supply is important from the standpoint of customers' safety. The Public Service Electric & Gas Co., in New Jersey, had considerable trouble in its gas department. In April a strike of 1,200 workers in nine gas plants was threatened and the state government took the plants over for five days under a statute enacted two weeks previously. They were returned to company control on April 9, when six independent unions ratified a wage increase of about 13 per cent, 20 per cent having been asked for. In June the Paterson plant was taken over during a brief strike. On Dec. 24 a strike of AFL workers began in Jersey City; the state took over and stopped gas distribution to industries, but the strike ended on Dec. 26, with a 30-cent hourly wage increase demand to be mediated. On the same day, however, 400 AFL production employees at the Harrison plant, largest in the state, struck for a 30-cent increase. The state did not seize the plant until Dec. 28, when pickets blocked passage of esential coke into the plant. The coke was admitted and mediation was ordered, but the strike was still in effect at the year's end. Supervisory employees kept the plant in operation.

MILWAUKEE STRIKE

A four-day strike of CIO gas workers in Milwaukee, which ended

July 27, caused actual stoppage of gas service to a great many consumers, other than hospitals. The company was able to keep its mains full with gas purchased from the Milwaukee Solvay Coke Co. but because of reduced pressure consumers were warned to turn off the gas at the meters to avoid danger of explosions. Fortunately when normal service was restored only one serious explosion occurred.

LOCAL TRANSPORTATION STRIKES

Several extensive strikes took place in the local transportation field. Detroit had a week's strike in April on the city-owned street railway and bus system. The men asked an 18-cent increase and the city offered 15 cents which was finally accepted, with arbitration of another point. Other cities hit by transportation strikes included Los Angeles, Philadelphia, San Francisco, Columbus (Ohio), Atlanta, Oklahoma City, Lancaster, Saginaw, and parts of New York City. In the latter metropolis the Transport Workers Union (CIO) threatened a strike on the city-owned rapid-transit system for higher wages and recognition as sole bargaining agency on the system. The latter claim was withdrawn after being ruled unlawful. Other questions went to arbitration, resulting in a substantial wage increase.

TELEGRAPH AND TELEPHONE STRIKES

A five-week strike of Western Union telegraph workers in New York City ended on Feb. 10, 1946 with an agreement to arbitrate.

Brief strikes of Bell telephone workers occurred in various places, and the National Federation of Telephone Workers has set April 7, 1947 for a national strike if satisfactory contracts have not been negotiated by then.

MEASURES TAKEN AGAINST UTILITY STRIKES

Three unusual devices for dealing with public utility strikes appeared during the year. The first was the passage in New Jersey of the state utility labor relations law, giving the state the right to seize utility plants threatened by strikes. It was invoked several times, as previously noted. At the year's end Walter E. Edge, outgoing Governor, who had advocated the law, urged that better means of enforcement be added. The second was the action of Governor William M. Tuck of Virginia in drafting AFL employees of the Virginia Electric & Power Co., who threatened to strike, into the state militia and furloughing them to their jobs; this order was promptly rescinded when the company and the men agreed to arbitrate a question of retroactive pay increases. The third was the short-lived injunction used in Pittsburgh, as described before.

A new organization of utility employees was formed in April when a constitutional convention of the Utility Workers Union of America (CIO) was held; it was reported to represent 50,000 employees of electric, steam, gas and water plants, largely in New York City.

On Dec. 9, at the call of the Department of Labor, a meeting of labor and management representatives was held in Washington to discuss methods of maintaining industrial peace in the utility field, primarily by voluntary means.

CONCLUSION

Public utilities in general came through 1946 very successfully, both financially and from the standpoint of rendering expanded service, despite handicaps as to shortages of some types of equipment and occasional difficulties with more militant organized labor. With economic activity generally at a high level at the end of the year and with demands still largely unsatisfied for electric and gas appliances, telephones, etc. and for utility service to new areas and customers, public utilities as a whole seem likely, barring an economic depression, to experience a further period of expansion in 1947 and beyond.

WATER SUPPLY

By Clinton L. Bogert
Consulting Engineer, New York

GENERAL

The year 1946 will probably go down in history as marked by a lack of construction activities, but as most productive of studies and plans in the blue print stage. It failed to produce the promises made by proponents of water works projects in 1945. A canvas of state authorities showed that the new works scheduled in Water Works Engineering in 1945 were still in the blue print stage in 1946. While other municipalities held off from undertaking construction, the Board of Water Supply of New York City resumed actual work on the much needed Merriman Dam. The 41-mile aqueduct for Salt Lake City was completed in March.

CONSTRUCTION FACTORS AND COSTS

The hesitancy of manufacturers to supply new equipment or parts at the prices prescribed by the Office of Price Administration proved a great handicap to the maintenance departments of all municipalities and water companies. Everywhere difficulty was encountered in securing open bids on municipal contracts where early delivery was stipulated. In June, W. W. Brush wrote: "At present water works executives realize that the housing construction program that is being developed by the Federal Government will prevent much water works construction outside of the vast volume needed to provide water supply for 2,700,000 homes in the next 2 years, which is the housing goal."

In a study presented to the annual meeting of the American Society of Civil Engineers in January, Louis R. Howson, a consulting engineer of Chicago, based on the trends of construction costs from 1860 to 1946 concludes that future water works construction costs will be 50 per cent higher than in 1939; and based thereon Howson concludes that there should be an increase of about 20 per cent in the prices charged for water. In February 1946 construction costs were 135.7 per cent above the 1939 level, and 153.5 per cent in August; in November they had moved only to 153.9 per cent which may indicate that the peak had been reached in the Fall.

MERRIMAN DAM

Payment for work on the $16,000,000 contract, which was awarded July 25, 1939, amounted to about $7,000,000, when, owing to war conditions, the contract was cancelled in August, 1944. New bids to complete the work were received Feb. 26, 1946; the contract was awarded at $14,300,800. The chief items of work are rolled embankment, concrete and cement; the 1946 unit price bids were above the 1939 bids by 100%, 44%, and 70%, respectively. A supplementary agreement with the S. A. Healy Company, which was awarded the work under 55 items, provides that "if the total actual cost to the contractor proves to be less than 85 per cent of the bid price, the contractor agrees to let the city keep 80 per cent of the difference, and the contractor receives the other 20 per cent."

WATER SUPPLY SOURCES

From Jan. 1 through April 22, only 7.35 inches of rainfall were recorded in New York City, the least rainfall for that period since recording started in 1871. The nearest comparable period was 1927 when the record showed 9.12 inches. Normal rainfall would be 13.47 inches for this period of 112 days. Washington, D. C. also experienced about half the amount of normal rainfall, with only 6.63 inches.

QUABBIN RESERVOIR

Quabbin Reservoir, which is the main storage reservoir of the Metropolitan District Water Commission furnishing water to the majority of the people in the Boston Metropolitan Area and the world's largest reservoir for the water supply of a group of municipalities was filled to the crest of the masonry spillway of Winsor Dam on May 30, 1946. Filling of this 400,000,000,000-gallon reservoir began on Aug. 7, 1939. The area of Swift River watershed directly tributary to Quabbin Reservoir is 186 square miles.

WATERSHED FORESTATION

N. C. Brown of the New York State College of Forestry contends that wood in any form is likely to be valuable in the future, especially when grown near communities. He estimates that several million acres of watershed are now planted to forests, which contain up to 100,000,000 trees; these serve not only to retard runoff, but to provide timber crops for the future. Seattle, Wash. has 68,000 acres of forests; Newark, N. J. 36,000 acres. Other examples of forests on watersheds may be found at Essex Junction and Rutland, Vt.; Manchester, N. H.; East Orange, Atlantic City, and Jersey City, N. J.; Salt Lake City, Utah; New Haven and Hartford, Conn.; York, Scranton, Wilkes-Barre, and Reading, Pa.; Glens Falls, Syracuse, Little Falls, Gloversville, Troy, Rochester, N. Y.; and Westfield, Mass. The type of trees should be varied to conform to soil and climatic conditions.

RECESSION OF WATER TABLE IN WISCONSIN

A research committee has been formed at the University of Wisconsin to locate the existing water tables and determine whether certain areas are being overpumped, and the possibilities of recharge. The committee expects that there has been an overdraft from war industries and air conditioning.

PROPOSED NEW SOURCE FOR PHILADELPHIA

The board of five consultants appointed in 1945 to assist the 20-man water commission recommended (1) abandonment of the Schuylkill as a source, (2) construction of a 98,000,000,000-gallon retention reservoir on the Delaware River about 13 miles above the Delaware Water Gap, (3) an intake on the Delaware River at Yardley, above Trenton, and the construction of a tunnel to a proposed pumping station at Neshaminy Creek, whence water would be pumped to a proposed regulating reservoir at Warrington, or flow by gravity through a new tunnel to the Torresdale filters.

POLLUTION CONTROL

H. R. 6024, known as the Mansfield Bill, and on which finally the House of Representatives failed to take action, contained provisions for pollution control which were objectionable to water-supply engineers. At the St. Louis convention in May of the American Water Works Association. Dr. Abel Wolman of Johns Hopkins University estimated that between $2,000,000,000 and $3,000,000,000 will be required to correct stream pollution. On a recent survey of pollution of the Ohio River, $700,000 was expended, but it was a thorough survey. There is a growing apprehension by industry that "the cost of treatment of wastes ought to be considered a fundamental part of the cost of production." The New York legislature in 1946 authorized an interstate committee to determine the extent of pollution of the state's waters and recommend a program of corrective action. This committee held meetings in Syracuse, Utica, and Buffalo.

DRINKING WATER STANDARDS

The United States Public Health Service, under its authority over interstate health matters, on Feb. 6, 1946 promulgated new standards superseding those of 1942. The new standards differ from the old in amplifying Sanitary Defect to include a condition which "prevents satisfactory purification of the water supply," or allows "dual supplies, by-passes, cross-connections, interconnection and back-flow connections." Also the 1946 standards impose on the health departments of the states the obligation of being the reporting agency to advise the United States Public Health Service as to the compliance with these standards of the various water systems in the continental United States. This placed on the states a burden of inspection of premises of consumers which they were not prepared to assume, and a Conference of State Sanitary Engineers was scheduled for Nov. 11 at Cleveland.

PUBLIC VS. PRIVATE OWNERSHIP OF WATER WORKS

W. W. Brush, editor of *Water Works Engineering,* in the issue of Feb. 20, 1946 brings out the following items which are not often given due consideration:

"To make a fair comparison between the cost of the water system to the consumers as operated under private ownership, the taxes paid by the private company should be given in detail and the loss in taxes be shown that would result with municipal ownership. This loss in taxes should be set up at the different levels of government such as local, state, and federal. It may be difficult to determine effect on the local community in the loss in taxes at the state and federal level, but this item should be mentioned.

"Also, in the comparison, should be included as part of the municipal cost, all municipal services that are rendered free, such as occupancy of buildings, legal advice and many other items.

"No one should object to a municipality attempting to purchase and operate the local water system, but in the comparison of the two plans, the private water company is entitled to a fair factual picture of relative costs being given to the citizens."

WATER RATES

On Jan. 29, 1946, the Connecticut Supreme Court of Errors ruled that an increased schedule of rates charged by the New Haven Water Company since Nov. 1, 1939 was legal and that the company had no obligation to make any refunds to customers. A refund of $900,000 would have been involved.

In Massachusetts, legislation was passed providing that beginning in 1946 the price of water in the Metropolitan District of Boston should be fixed at $40 per 1,000,000 gallons regardless of the amount taken, and irrespective of the valuation of each community.

SUPERINTENDENTS LICENSED IN NEW JERSEY

The 1946 legislature amended the public health laws pertaining to public water supplies so as to strengthen the State Department of Health in Court action like that against the City of Hoboken in 1942. "The law provides for the automatic issuance of a license to the person in charge of the plant or system, at the time of the passage of the act, to operate the plant or system in which he was engaged. All other applicants are required to qualify and to be examined by the Department before being issued a license."

COMPENSATION OF WATER WORKS EMPLOYEES

For the 14 months ended Dec. 1, 1946, the City Council of Cincinnati, O., where the workers in the city water department had threatened to strike, granted 4,500 employees a 25 per cent pay increase, at the total cost to the city of $635,000.

EMPLOYEE PROFIT-SHARING PLAN

In January the Public Service Commission of Wisconsin declared legal the profit-sharing plan of the Waukesha Water Utility. The employees will share in 4% of the net income, but no employee shall receive more than $200 per year for the years 1944 and 1945. Employees who have put in six months in any year are eligible to the benefits, which shall be considered as part of the wages or salary.

RETIREMENT PLAN, DES MOINES

Under 1945 legislation of the state of Iowa the Board of Water Trustees of the city of Des Moines were enabled to make a Declaration of Trust, covering a pension and annuity retirement system. It covers full-time employees of at least one year. Employees contribute 3 per cent of earnings, and the Trustees make up the difference required to assure each contributing employee the retirement annuities, death benefits, and separation benefits stipulated in the Declaration of Trust.

SEGREGATION OF UTILITY

American Water Works and Electric Co., the largest operator of privately owned public water supply companies in the United States, announced that it would segregate these enterprises into a separate company, completely disassociated from its electric and other utility operations. The segregation is being made in accordance with plans recently filed with the Securities and Exchange Commission, by which the company is conforming its holding company system to the requirements of Section 11 of the Public Utility Holding Company Act of 1935.

ACTIVATED SILICA IN WATER TREATMENT

The merits of activated silica were presented by Harold R. Ray of the Philadelphia Quartz Co. in a series of articles in *Water and Sewage Works.* It produces more effective coagulation in both warm and cold water periods; increases floc size and densifies floc; reduces the necessary alum and alkali consumption; broadens the effective pH range of treatment; increases the length of filter runs; buffers sudden chemical changes of raw water characteristics; reduces the raw water color by better than 90 per cent; improves filtered water quality generally and reduces turbidity; prevents "after precipitation" of alum during cold water periods when alum reacts slowly; and decreases dissolved silica.

ELECTRONIC PRINCIPLE OF WATER PURIFICATION

Fred E. Stuart in *Journal of the New England Water Works Association,* Sept. 1946, advocates this method for alkaline or acid solutions, containing concentrations of color-bearing materials; they may be coagulated under conditions requiring materially less control than the present application of filter alum and hydrated lime for the resulting formation of hydrous aluminum floc for color removal.

CORROSION CONTROL

Much work has been done on the use of polyphosphates and silicates which are capable of depositing a relatively impervious film on the surface of a pipe. Basic research is needed to coordinate and clarify conflicting empirical results. The new organic carbons containing silica and carbon, and known as silicons, may prove effective in corrosion control. (Rolf Eliassen, *J. A.W.W.A.,* Oct. 16, 1946). Powell, Bacon and Lill (*J. A.W.W.A.,* July 1946, page 808) hold that "corrosion, which is a result of contact of water with ferrous and nonferrous materials, would be practically non-existent if the waters were free of oxygen and other corrosive gases, or if some steps were taken to protect the metal surfaces from contact with these gases."

"Small doses of polyphosphates are effective in controlling scale and inhibiting corrosion which may result when deposition of scale is prevented. Properly controlled lime, high doses of polyphosphates or sodium silicate will greatly mitigate corrosion and prolong the life of ferrous metals exposed to the action of soft corrosive water."

Experiments at Pasadena with lime and phosphate proved so promising that a permanent plant has been constructed. About 4 p.p.m. lime was required to neutralize the CO_2 and raise the pH. To reduce corrosion further and hold the lime in solution 2 p.p.m. of phosphate was added.

At the Naval Station in California, red water troubles were found to be due to the anaerobic corrosion of a steel main. Corrosion of a ferrous metal is possible in strongly acid solutions or when a chemical is present in the solution which can react at the cathode surface. Nitrate is an example of such a chemical. Raising the pH from 6.4 to 8 completely arrested the corrosion both in the presence and absence of chlorine.

FLUORINE AND TEETH DECAY

Henry Klein, Senior Dental Officer, United States Public Health Service, presented (*Public Health Reports*) confirmatory evidence on the inhibitive effect of fluorine in a public water supply on the incidence of dental caries, or tooth decay.

MODE OF ACTION OF CHLORINE

The Green and Stumpf Laboratory Department of Medicine, College of Physicians & Surgeons of Columbia University, at the request of the Office of the Quartermaster General, made a study between May 1944 and December 1945 of the fundamental biochemistry of water disinfection.

"Employing the technics of physiological chemistry to determine the manner in which chlorine exercises its bactericidal action, the authors show that the trace level at which chlorine is effective implies that it must inhibit a key enzymatic process. This process is determined to be the oxidation of glucose by the bacterial cell; once the power of glucose oxidation is lost, the bacterial cells die—the suspension becomes sterile. The authors further show that the reaction is not reversible; that is, that bacteria once inactivated by chlorine cannot be reactivated. They show that another halogen—iodine—has the same power, but requires higher concentrations for equivalent bacterial kills."

CHLORINE DIOXIDE FOR TASTES AND ODORS

At Lawrence, Kansas, it was found that ammonia-chlorine, activated carbon, free residual chlorination, or their combination, were effective most of the time, but under difficult circumstances (excessive concentrations of microscopic organisms, or unusual conditions created by surface drainage) successful elimination of tastes and odors have resulted from prechlorination for disinfection, followed by treatment with chlorine dioxide to oxidize or destroy the organic material in algae or phenolic pollution. For the most economical use of chlorine dioxide, apply it to a water of lowered pH after the water has been exposed to a small dose of activated carbon for six or more hours. A taste-free water is produced. At Beaver Falls, Pa., experiences indicate that it eliminates certain tastes, but "that in some cases it merely changes the character of the tastes and odors without eliminating them completely."

INACTIVATION OF POLIOMYELITIS VIRUS BY CHLORINE

Investigations by the Division of Virology and Laboratory of Biophysics of the Michigan Department of Health, based on the possibility that polyomyelitis might be a water-borne disease, indicate that no active virus was detected after 30 minutes contact with water containing a chlorine residual.

FORMULAS FOR PIPE FLOW

In a paper presented at the 1946 convention of the American Water Works Association, Julian Hinds compares various formulas (Chezy, Kutter, Darcy, Manning, Williams-Hazen, Scobey) and concludes that from the point of view of the water works engineer:

"1. The older pipe flow formulas are imperfect and are limited in scope, but uncertainties involved in their use are not markedly greater than other uncertainties inherent in the design of water supply systems.

"2. Of the newer formulas, that for laminar flow may be accepted as theoretically exact and that for smooth pipe as accurate beyond practical needs. These formulas are of little use in the design of water systems.

"3. The Colebrook formula for turbulent flow in rough pipes is ideal in its conception, but it requires further substantiation, particularly in the transition zone, and the development of a definite scale of values for its roughness factor, *k*."

FAILURES OF DOMESTIC HOT-WATER TANKS

Investigations, by Hoover at Columbus and Bialosky at Chicago, on galvanized tanks were reported to the 1946 convention of the American Water Works Association. Hoover experimented over a 10-year period with water-conditioning as well as other metals than galvanized iron. Experiences at army camps indicate that where water is heated to 180°F., overheating is "probably the greatest contributing cause to premature failure of hot water tanks." Galvanizing does not protect the steel when the alkalinity of the water is low (20 to 30 p.p.m.). Cement or stone-lined tanks showed excellent results; resinous (plastic) linings are still in the experimental stage. Cathodic protection proved effective. Bialosky found the preparation of the steel surface prior to galvanizing an important life factor; as to the water supply, he found importance in the quality of water, rate of flow through the tank, pressure variations, and particularly the temperature of the water and the rate of application of the heat. Softening of water accelerates tank failures; hard waters form a protective scale of calcium carbonate.

NEW DEVICES AND MATERIALS

A valve actuator, designed to operate valves hydraulically, through a reversible electric motor of small horse power which drives an oil pump in either direction as required, has been installed in a power plant of the Los Angeles Department of Water and Power. (S. B. Morris, Jr. *J. Am. W. W. A.*, Sept. 1946.)

"There are being developed many interesting new synthetic thermosetting and thermoplastic materials which appear to have very good bond to metal, good resistance to abrasion and excellent resistance to conditions of exposure common in water works operations." (See also Smith on Plastic Coatings in *J. N. E. W. W. A.*, June, 1946.)

STREET AND HIGHWAY TRAFFIC

By Burton W. Marsh

Director, Traffic Engineering and Safety Department,
American Automobile Association

GENERAL

The year 1946 produced increasing evidence that we, as a people, have to a serious degree failed to realize the importance of highway transportation or to appreciate the serious results of failure to deal with it effectively. Highway transportation simply has not been placed at anything like the importance level which it now warrants. This undervaluation is most apparent in cities where despite serious and in some places critical traffic and parking conditions, there generally has not been appropriate reorganization for effective administration of the highway transportation function. There were numerous significant developments during 1946 which give hope for better progress. It can not be said, however, that these justify assurance of adequately staffed, efficient management of highway transportation in the near future—badly as this is needed.

DESIGNATION OF NATIONAL SYSTEM OF INTERSTATE HIGHWAYS

While the overall highway transportation picture in 1946 was not good, there were a number of constructive developments. The Federal Aid Highway Act of 1944 provided in Section 7 that there should "be designated . . . a National System of Interstate

Highways not exceeding forty thousand miles in total extent so located as to connect by routes as direct as practicable, the principal metropolitan areas, cities, and industrial centers, to serve the national defense, and to connect at suitable border points with routes of continental importance in the Dominion of Canada and the Republic of Mexico." The act provided that the routes should be selected by joint action of the state highway departments with the U. S. Public Roads Administration having the responsibility of coordination. During 1946 this task of designating the nation's most important road network was virtually completed. In fact, only two or three features remained to be worked out at the end of the year. This network while constituting but one per cent of the nation's road mileage, will carry some 20 per cent of the total vehicle-miles of traffic.

NEW STANDARDS FOR INTERSTATE HIGHWAY SYSTEM

While not as high as recommended in the report of the committee which developed the justification and basic plan for the Interstate Highway System, the new set of high standards for this system adopted by the American Association of State Highway Officials Aug. 1, 1945, are ready for use as the development of this top priority network gets under way. Standards are varied to meet differing traffic needs.

INTERSTATE HIGHWAY NETWORK

Numerous measures instituted in 1946 for promotion of expeditious construction of the Interstate Highway Network. A number of organizations favored the program. The American Automobile Association issued an illustrated brochure designed to secure the support of the country's leaders for the network and a simpler illustrated folder for much wider distribution. About a dozen national organizations are joining in giving these materials wide distribution.

Much stress was placed on getting "demonstration sections" completed. The Automobile Club of Michigan and the Chicago Motor Club joined in employing a former president of the American Association of State Highway Officials to devote full time to promoting the development of the part of this network between Detroit and Chicago. Much progress has been made in lining up support along the route.

CALIFORNIA STUDY AS BASIS FOR HIGHWAY IMPROVEMENT PROGRAM

One of the year's developments of top-ranking significance was the thorough study which California made of road needs and costs, and of road revenue and sources. The purpose was to provide the legislature with the best possible bases for sound decisions as to a long-range program of highway improvement and as to how this should be financed.

The legislature set up a Joint Fact-Finding Committee on Highways, Streets and Bridges; $100,000 was appropriated (later supplemented with another $20,000). An Advisory Council was appointed, made up of 29 representatives of statewide public and private agencies interested in road problems.

It was decided at the outset to secure the services of the best qualified available specialists in the nation to act as consultants to a highly competent working staff. Active support of the U. S. Public Roads Administration was provided. The State Division of Highways (of the Public Works Department) supplied most of the basic data. Original research data were also supplied by the Public Roads Administration from nation-wide studies.

While the staff and consultants were busy, the Committee literally covered the state, holding hearings in every section and district so that every official agency, non-official group and individual with something to offer, could get to a hearing without having to travel far. Three comprehensive reports were presented in the latter part of 1946 as bases for the report of the Committee.

A preliminary report of the Joint Fact-Finding Committee was prepared. The committee proposes a total expenditure of at least $2,800,000,000 (July 1, 1945 to June 30, 1959) to condition segments of a road and street system which "are critically inadequate." The Committee also proposes a reclassification of roads and streets in accordance with the predominant purposes served. There would be a state highway system. Both county roads and city streets would be divided into a primary and a secondary classification. Motor vehicle users would be assigned primary financial responsibility for improvement and maintenance of the state highway system, and construction and replacement of a system of city streets of major importance and of primary county roads. The cost of other roads and streets to give access to land and dwellings would be borne by "present and prospective beneficiaries of their use." Taxes on the heavier vehicles would be increased to compensate for the inequity of the gasoline tax on the light vehicles since "gasoline consumption per mile does not increase proportionally to the gross weight of the vehicle."

The Committee would require, in addition to limitation of allocation of funds to counties and cities, the establishment of a centralized and efficient road or street administration in a county or city as a prerequisite to receiving state financial aid. It also proposes clarification in lines of authority and responsibility connecting the legislature, the executive department, and the highway commission. Policy making would be centered in a highway commission of not more than seven serving overlapping towns. appointed by the governor. The Committee states that "no amount of capital investment in a road or street plant can produce optimum service in the absence of effective regulation of highway use." Authority would be properly vested to control the conditions and standards of use of roads to prevent capital investment from "being destroyed by unrestricted operation of heavy vehicles on roads and bridges originally designed to carry light loads only." Law enforcement would be greatly improved.

SIMILAR STUDIES IN MICHIGAN AND ELSEWHERE

The Michigan Good Roads Federation in 1946 appointed a committee to carry out a similar program. The Michigan Committee is made up of representatives of the state highway department, counties, municipalities, the farm group, passenger car owners, petroleum, road equipment, road materials, and the commercial vehicle group. Initial plans for financing the study involve both governmental and private-business contributions. Michigan plans were being formulated and a staff was being organized at the year's end.

A number of national organizations are promoting the conduct of such studies in the other states. The American Automobile Association adopted a policy for such a program in every state and in favor of having the committee responsible for the study include both governmental and interested non-governmental groups. It urged a 5-10 year program and also that the committee work for continuity of the road program and of the major technical staff of the highway department.

CONNECTICUT POLICY TO MAINTAIN DESIGN STANDARDS

A decision made by the Connecticut highway department in 1946 can have very great significance. Design standards are being adopted for each mile of road based on present and estimated future traffic needs. As funds are made available, fair apportionment will be used to improve as many miles of the road as its share of the funds will buy at the adopted standards. The standards will not be reduced so as to permit building more mileage with available funds.

All too often across the country, standards have been reduced to permit meeting widespread demands for more road mileage. Such reductions have been most serious in the matter of widths of right-of-way. The inadequacy of rights-of-way on many heavy traffic routes now torments highway officials, and the cost of securing much greater widths is frequently almost prohibitive.

HIGHWAY RESEARCH NEEDS

The first full year of operation of the new highway research correlation service was carried on in 1946 for the state highway departments by the Highway Research Board of the National Research Council, National Academy of Sciences. The significance of this point is that it seems to mark an increased appreciation among state highway administrators of the great importance of having more highway research work done. Over the years, highway research has not only resulted in greatly improved roads but has paid for itself many times over through reductions in road construction and maintenance costs. longer road life, reduced costs of operating vehicles, accident reductions, decreases in delay and congestion.

The Public Roads Administration has given leadership both in the conduct of many highly important researches and in aiding and fostering research work. At the 1946 Highway Research Board meeting PRA staff members reported on important research projects concerning state highway administration, parking, highway and urban street capacity, right-of-way and highway border control, mechanical traffic counts, uses of highway planning survey data, highway maintenance costs, resurfacing concrete pavements, joints in concrete pavements, surface drainage, rigid and non-rigid pavement design.

In 1946, it became more generally realized that certain funds from the Federal Aid Highway Act of 1944 could be used for research by college and university groups acting for and under contract with one or more state highway departments. This realization may result in other college research work, such as the valuable work done for years at Iowa State College and in the Joint Highway Research Project at Purdue University. In 1946, a valuable study on tractive resistance on ice was reported by Prof. Ralph A. Moyer of Iowa State College. Researchers under the direction of Prof. K. B. Woods of Purdue won the Highway Research Board award for their paper on pavement blow-ups.

There still remains the serious problem of getting research results applied. The lag between important findings and general application is much too long. In part, this lag occurs because while there are some (though not enough) fine highway researchers, there are almost no highway research interpreters and research-use promoters where no commercial material or business gain is involved. In sharp contrast, representatives of highway materials organizations generally do a prompt and effective job of bringing out to potential users the meaning and application of research findings favorable to their product. In 1946, a start was made by the Highway Research Board in getting certain research findings better known.

VEHICLE SIZE AND WEIGHT STANDARDS

There are wide differences in the limits imposed on sizes and weights of vehicles by the laws of the various states. These differences complicate and hence increase the cost of manufacture. Moreover, where there is enforcement, these differences interfere with the interstate movement of vehicles which do not comply with limitations of each and every state traversed.

The American Association of State Highway Officials had not revised its standards since 1932. War conditions had brought further complications. Consequently the Association, after study by one of its committees, adopted new standards. The principal changes were from 16,000 to 18,000 lb. axle load, from 35 ft. to 40 ft. for a three-axle bus, from 35 ft. to 50 ft. for a tractor semi-trailer combination, from 45 ft. to 60 ft. for a truck-trailer combination, and substitution of a table for gross weights in place of a formula. The AASHO recognized the desirability of increasing permitted width from eight feet to eight feet six inches, but stated that highway development (lane widths) did not justify the increase at this time.

With most of the AASHO standards, there is quite general agreement among national groups principally interested. On a few matters, principally increased length and hence weight standards, there is some disagreement, as by the American Automobile Association. In part, such disagreement results from the dislike and fear of private motorists for very large vehicles and combinations on most roads. Thus, some aspects of the matter are subjective. Other aspects are objective, however, and it is encouraging that in 1946 one important study was undertaken, the results of which should reduce the area of disagreement. It is a study of the economics of size and weight factors in highway transportation.

UNIFORM TRAFFIC CONTROL DEVICES

During 1946, new and greatly improved standards for traffic signs, signals, markings, and islands were adopted by a joint committee of representatives of the American Association of State Highway Officials, Institute of Traffic Engineers, and National Conference on Street and Highway Safety. Examples of significant changes are larger signs for high speed, larger and clearer lettering, increased night effectiveness as by required illumination or reflectorization of such as stop signs, more clear route markings especially in cities, increased emphasis on locating traffic signals for satisfactory visibility, more attention to actuated signals (responsive to "requests" by vehicles), almost if not quite one and only one approved method of marking No Passing zones (instead of the numerous variances in effect today), better provisions for attracting motorist attention both day and night to the approach end of a safety zone or other island.

The new manual embodying these new standards will be published soon. It has been effectively designed for ready use and easier understanding.

SCHOOL BUS CONSTRUCTION STANDARDS

A new booklet *School Bus Standards* was published in 1946. Approved late in 1945, it was produced by a Conference on School Bus Standards. These standards were developed through the cooperative efforts of representatives of state education departments, with the advice of engineers of the automotive industry and consultants of institutions, agencies, and organizations interested in safety and school bus standards. This booklet replaced standards adopted in 1939. The new standards will provide greater safety and more economy for an important segment of our population.

PRESIDENT'S HIGHWAY SAFETY CONFERENCE

As traffic increased following the end of the war and the removal of restrictions, traffic casualties mounted alarmingly. In this connection, it should be pointed out that, in the public mind, it is the total number of traffic fatalities which is the reference point. Actually, fatalities in terms of vehicle-mileage is a much fairer comparison and on that basis the fatality rate did not rise alarmingly, but the total number did soar and the situation began to get headlines, much magazine, radio and speaking-platform attention.

The President decided to call a highway safety conference May 8-10, 1946. In the advance conferences it was agreed that new policies, new organization ideas, new methods were not the need. Plenty was known about how to reduce traffic casualties. The great need was to get action on the known ways of reducing the toll. Hence, the subject reports should be largely compilations of best accepted principle and practice, while the major attention of the conference would be on action-stimulation methods.

Time was short for organization of the conference staff, planning, lining up the nine conference committees, getting committee reports approved and printed, arranging for housing the conference, and handling invitations. Nevertheless, by heroic efforts, a generally splendid job was done in producing and getting adoption of the eight subject committee reports (with over 200 important recommendations) and an over-all action program.

Major conference outcomes were: (1) dramatizing the traffic safety problem and attracting increased attention to it by officials, agencies of public information, organizations of many types, and key leaders; (2) providing in summarized form comprehensive guides to action on laws and ordinances, accident records, education, enforcement, engineering, motor vehicle administration, and public information; (3) fostering the conduct of state and local traffic safety conferences and the adoption through them of programs of action; (4) fostering the organization of a Coordinating Committee for Federal departments and of a national committee of state officials dealing with traffic safety matters, enlargement and greater activity of a national committee of non-official organizations (National Committee for Traffic Safety), and further stimulation of the Committee on Uniform Traffic Laws and Ordinances; (5) stimulating numerous private organizations to undertake greater activity in traffic safety in their own names; (6) improving the understanding of many individuals as to the over-all traffic safety problem, the many corrections required, and the need for effective coordination.

Many would say that the major outcome was this proof of the practical life-saving value of the President's Conference and activities growing out of it. Compared to 1941, the last pre-war year of normal traffic, the first four months of 1946 produced about 1 per cent more fatalities than in 1941. For the seven months, for which data are available, beginning with May, fatalities in 1946 were 21 per cent less than in 1941.

Other factors not related to the President's Conference may have had significant effects on this improvement. The gradual return to more equilibrium after the "whoopee" reaction resulting from the war's end, increasing personnel in traffic activities with return of war veterans, termination of better paying war jobs, and growing public reaction resulting from publicity as to large increases compared in the usual way to the preceding year (first four months had 47 per cent more traffic fatalities).

NATIONAL COMMITTEE FOR TRAFFIC SAFETY

This Committee increased its list of participating organizations from about 50 to some 77 at the year end. Budget increases and a new joint financing plan were other significant developments. An inventory of activities and areas of interest is being made among participating organizations. Increased activity by all is being stimulated. Avoidance of undesirable duplicatory and overlapping activities is a goal. Development of cooperativeness and friendliness among organizations working in traffic safety is another important objective.

All too little has been known as to what the public thinks about various traffic and traffic safety matters. In 1946, a significant public opinion poll was conducted by one of the leading poll-taking organizations on behalf of the National Committee, with funds made available by the National Safety Council. "The Public's Attitude on Traffic Safety"—the resulting report—is an extensive analysis of great value, especially to those working in the field of traffic safety.

A project for development of a booklet on traffic safety in new (and re-planned) residential developments (or "subdivisions") was one special activity of the National Committee which reached tentative draft status in 1946. In general, however, the National Committee does not carry out original studies or projects, but rather stimulates such action by other appropriate existing groups.

AUTOMOTIVE SAFETY FOUNDATION

Among a number of new and enlarged activities of this body, a valuable service was instituted for states by analyzing, upon invitation, their vehicle code in comparison with the Uniform Vehicle Code. Similar analyses are offered to cities of their traffic ordinances in comparison to the Model Traffic Ordinance. This service will be of significant value in improvement of such legislation and in securing more uniformity.

AMERICAN AUTOMOBILE ASSOCIATION

Greatly increased activity for highway improvement and traffic safety was shown by the Association, which issued materials promoting the Interstate Highway System, issued a parking manual, and instituted a "Take It Easy" program directed to the individual driver and pedestrian and urging taking personal measures for safety.

NATIONAL SAFETY COUNCIL

The Council instituted an important joint study, with state highway officials and Public Roads Administration, of the relation of physical features of highways to traffic accidents. The progress report showed significant results. Valuable research on tractive resistance on ice, with and without different types of tire chains, was conducted.

AMERICAN RETAIL FEDERATION

The Federation published a brochure on parking problems in business districts, "Keep Customers Coming," with technical assistance by the Automotive Safety Foundation. Through this interest in parking, retailers became much more interested in getting maximum efficiency from existing streets and in new traffic facilities for present and future needs. Frequently, as in Los Angeles, a retail leader will be found heading a city or metropolitan traffic (or traffic and transit) committee.

HIGHWAY AND TRAFFIC LEGISLATION

Models for state and municipal traffic and vehicle legislation were reviewed and improved in 1946 by the Committee on Uniform Traffic Laws and Ordinances of the National Conference on Street and Highway Safety. While the National Conference was terminated in 1946, it was decided that the Committee should continue to function independently. This showed how important sound guides for uniformity in vehicle and traffic legislation were considered.

A significant analysis of state legislation, which authorizes the creation of "authorities" or agencies to deal with parking needs, was made as a Highway Research Board project. The 1946 report showed surprisingly that 22 states have some such legislation. Two alternative tentative models for comprehensive state enabling legislation for local parking agencies were the main outcome of this excellent analysis.

Kentucky enacted a controlled access highway law in 1946, making suitable provisions for express highways and their protection, thus bringing the number of states having such legislation to 24.

Texas in 1946 adopted an amendment to its constitution requiring that motorist taxes be used only for highway purposes, thus bringing the number of states having "anti-diversion" amendments to 19.

In the courts, in 1946, was a case which might constitute a serious precedent regarding a provision of the basic Federal Aid Highway Act. This provision is to the effect that "all highways constructed or reconstructed under the provisions of this act shall be free from tolls of all kinds." Portions of the Hutchinson River and Saw Mill River Parkways in Westchester County, New York, were constructed under the provisions of the Federal Aid Highway Act, with Federal Aid funds. Westchester County is seeking to be relieved of the "no toll" provision through legislation and transactions which amount to returning to the Federal Government the Federal Aid granted on those projects. State legislation (Chapter 594 of the Laws of 1945 of the State of New York) authorized the county to collect tolls on these roads. The American Automobile Association, recognizing a dangerous precedent in this matter caused a suit to be filed to prevent imposition of the proposed tolls. If Westchester County can thus be relieved of the Federal Aid Highway Act prohibition against tolls, the precedent may cause other states or counties to do likewise. A final decision is pending.

EDUCATION AND TRAINING

Grade Schools.—The elementary school age group is the only segment of our population which has received continuing effective traffic safety education for two decades. The value of such education is shown by the fact that from 1922 to 1945 the death rate of the 5-14-year group decreased about 26 per cent, while every other age group showed an increase of from 7 per cent to 175 per cent. The increase for all age groups was 55 per cent. In 1946, education of this age group was further extended and improved.

High School Driver Training.—In 1946, much ground was gained on including driver education and behind-the-wheel training as a course in high schools. The President's Highway Safety Conference recommended such courses, a recent film "Teach Them to Drive" was widely used in promoting such courses, the National Commission on Safety Education of the National Education Commission completed a manuscript for a new booklet "Let's Teach Driving" designed to encourage the introduction of such high school courses and discussing ways of doing so.

The American Automobile Association finished an extensive revision of its *Sportsmanlike Driving* textbook for such high school courses, re-instituted regional seminars (at Teachers College of Columbia University, George Peabody Teachers College, Purdue University and the University of Denver) for college professors who present courses to high school teachers on how to conduct effective driver education and training. Through its three experienced educational consultants (financed by the Automotive Safety Foundation), the Association also presented 40-hour intensive training courses to 500 high school teachers in 20 courses throughout the country. These staff specialists also aided six states in completing course of study outlines. Large numbers of driver testing devices and other teaching aids were made available during the year.

Traffic Engineers.—The Yale University Bureau of Highway Traffic re-instituted its graduate course of one academic year in traffic engineering. This course had been a war casualty. Several short in-service training courses in traffic engineering were conducted in different parts of the country during 1946.

Traffic Police.—The Northwestern University Traffic Institute continued its two four-month courses per year in traffic law enforcement, as well as various short in-service courses both at the University and in various sections of the country. The Federal Bureau of Investigation continued to include quite a substantial amount of traffic law enforcement work in its National Police Academy courses, now held three times a year. The University of North Carolina, Purdue University, and The Pennsylvania State College are examples of other institutions where enforcement and other courses are being effectively presented under direction of full-time staffs.

Motor Vehicle Fleet Supervisors.—During 1946, the National Committee for Motor Vehicle Fleet Supervisor Training arranged for and assisted in staffing 29 courses in universities throughout the country for supervisors of motor vehicle fleets, average attendance 35 to 40.

URBAN TRAFFIC PROBLEM

It is generally agreed that urban areas are our worst traffic trouble zones. Half of all vehicle-miles of highway use are in urban areas. The inadequacies of highway transport organization and facilities in cities have been growing for many years, while the importance of highway transportation to urban life has steadily increased. With its increased traffic, 1946 produced serious traffic conditions in most cities and critical problems in some. For many years city administrators have complained of having too limited tax resources to meet traffic (as well as many other) needs.

In many cities the financial picture is growing worse. There has been a marked trend of suburban development, with many residents moving to beyond the city limits. Decreased residence values have resulted, with inevitable loss in tax revenues. Business decentralization has also occurred, though in widely varying degree in different cities. Often business establishments have also relocated beyond the taxing limits of the central city. Yet, as the metropolitan community has grown, the central city has faced increasing requirements for public works and services.

The financial plight of cities has been recognized by states through the return of portions of motorist tax revenues to cities—though generally not in the amounts of such revenues which come from city residents. The Federal Aid Highway Act of 1944 provided aid for major urban highways (on the Federal Aid system). Twenty-five per cent of the $500,000,000 Federal Aid appropriation for each of three post-war years is available for such use when matched by an equal amount from state or local sources. Increasing numbers of cities are considering methods of taxation which will produce revenue from those who use city facilities and directly benefit by city services but live outside the municipal limits. A payroll tax is one example.

CITY PARKING

Numerous trials were given in 1946 to the idea of establishing parking lots where land is available and costs will be low, near but not in the central business district and serving users by shuttle buses looping between the lot and the downtown district. Among cities where this was tried were Atlanta, Hartford, Baltimore, Chicago, Cleveland, Grand Rapids, Harrisburg, St. Louis. Such trials are significant because it is admittedly difficult to keep parking costs low when off-street parking facilities are provided within the downtown district. Several such "perimeter parking—shuttle bus" plans have failed for lack of patrons. It may be, however, that by a low fee providing both for parking and bus trips, by frequent bus service, by reasonably adequate coverage of the downtown district before looping back without too much time loss involved, by a minimum of walking being necessary between passenger car and bus, and suitable waiting place or places at the parking lot, the plan can be made effective.

DIVISION IX

DEFENSE AND ARMAMENT

THE UNITED STATES ARMY

By Robert S. Thomas
Military Historian, Historical Division, War Department Special Staff

THE ARMY AND RECONVERSION

The first full calendar year of peace after the Second World War was one of necessary and difficult readjustments. Millions of soldiers had again to become civilians; thousands of industrial organizations had to begin conversion from war to peacetime production; hundreds of hastily conceived governmental bureaus and agencies had to be liquidated as rapidly as possible in order that our main effort could be concentrated on the achievement of a pattern of living keyed to the hope of peace rather than to the scourge of war.

For the Army it was not enough, nor was it feasible, to get all the soldiers home immediately from foreign shores. The myriad problems at home in arriving at a normal manner of living were multiplied endlessly abroad where the stark ruin of war's force had left behind it razed cities, disrupted communications, ruined crops, shattered economic systems, and gnawing human hopelessness. A tremendous rebuilding job faced the world. The Army of the United States had a definite and important part in doing that job. In the European and in the Asiatic theaters, occupation forces labored to stabilize their areas. Along with this constructive work, shared with Allied nations, went also the harsh and bitter task of bringing enemy war criminals to the bar of justice where established military tribunals heard and evaluated evidence and, finally, by bullets, by the rope, and with prison bars ended the free careers of most of the human beasts whose vicious lust for power and personal gain had loosed carnage and desolation on the world.

ARMY ORGANIZATION

At the close of 1946, administrative organization was headed by Robert P. Patterson, Secretary of War, with Kenneth C. Royall, Under Secretary of War; Howard C. Petersen, Assistant Secretary of War; W. Stuart Symington, Assistant Secretary of War for Air. The military phase of command included General Dwight D. Eisenhower, Chief of Staff; General Jacob L. Devers, in command of Army Ground Forces; and General Carl Spaatz, in command of Army Air Forces.

During the year there was approved a comprehensive system of unified military commands designed to place responsibility for the conduct of military operations of the land, naval, and air forces in the several regions of military importance to the United States, each in the hands of one commander. These commanders are: (1) Far East Command, General Douglas MacArthur; (2) Pacific Command, Admiral John H. Towers; (3) Alaskan Command, Major Gen. H. A. Craig; (4) Northeast Command, commander not yet named; (5) Atlantic Fleet, Admiral Marc A. Mitscher; (6) Carribbean Command, Lieut. Gen. Willis D. Crittenberger; (7) European Command, General Joseph T. McNarney.

The Chief of Staff, General Eisenhower, had as his assistants: General Thomas T. Handy, Deputy Chief of Staff; Major Gen. Willard S. Paul. Personnel and Administrative Division; Major Gen. Stephen J. Chamberlin, Intelligence Division; Lieut Gen. Charles P. Hall, Organization and Training Division; Lieut. Gen. LeRoy Lutes, Service, Supply, and Procurement Division; Major Gen Lauris Norstad, Research and Development Division; Major Gen. Henry S. Aurand, Research and Development Division.

The Chiefs of the several arms and departments were: Major Gen. Edward F. Witsell, Adjutant General's Department; Lieut. Gen. Daniel I Sultan, Inspector General's Department; Major Gen. Thomas B. Larkin, Quartermaster General's Department; Major Gen. Everett S. Hughes, Ordnance Department; Major Gen. W. H. Kasten, Chief of Finance; Major Gen. Norman T. Kirk. Surgeon General; Lieut. Gen. Raymond A. Wheeler, Chief of Engineers; Major Gen. Harry C. Ingles. Chief Signal Officer; Major Gen. Alden H. Waitt, Chief of Chemical Warfare Service.

ARMY AIR FORCES

In this arm of the service there was much and varied activity during the year, with a consistent effort to attain greater speed and range in the air. Some of the air events of 1946 are here set forth.

Shooting Star P-80's.—On May 15, 25 Lockheed Shooting Star P-80's left March Field, California, for a coast-to-coast tactical flight in the first continental exhibition of mass formation flying of the Army Air Force's new jet-propelled fighters. Six twin-engine Fairchild C-82 Flying Boxcars, new transports, accompanied to provide necessary supplies and maintenance personnel. In June, four jet pilots flew their machines in from the Pacific Coast in half a day's time, had lunch, and flew back to their Pacific Coast base. Another Shooting Star flew from the Atlantic to the Pacific Coast in less than 4 hours 15 minutes. On Aug. 10, a jetplane flew the 395 miles from Wright Field, Dayton, O., to Richmond, Va. in 40 minutes, an average speed of 592.5 miles an hour. This mark did not stand long since it was broken by an official record of 611 miles an hour made by an XP-84 Thunderjet. Nothing portrayed so vividly the swing to jet and rocket propulsion as development of the XS-1. This rocket-propelled Bell Aircraft is designed eventually to reach a speed of 1,700 miles an hour at an altitude of 80,000 feet. It was towed and glide-tested from a B-29 at 600-miles an hour speed, awaiting completion of a newer type rocket engine. This supersonic plane is really designed to function as a flying laboratory to test the secrets of the upper air.

Bombers.—There were three items of outstanding interest in this field during the year. On Aug. 6 the Army Air Forces proved the practicability of long-range remote-controlled flights when two crewless B-17 Flying Fortresses landed at Muroc Army Air Field, California, after a successful 2,600-mile overwater crossing from Hile Naval Air Station, Honolulu, T. H. The trip took 14 hours and 55 minutes, setting a new endurance record for remote-controlled operation.

The next noteworthy bomber event happened on Aug. 8 with a successful test flight of the Consolidated XB-36, the world's largest land-based bomber. This plane which dwarfs the famous B-29 planes of the Second World War fame is 163 feet long, has a wing-span of 230 feet, and a rudder height of 47 feet six inches. It is powered by six 3,000 horsepower Pratt and Whitney engines mounted on the trailing edge of the wing, three on each side of the fuselage. Each engine drives a three-bladed pusher-type propeller. The bomb-carrying capacity of the XB-36 is more than 30 tons, and it is flown by a crew of 15 men occupying two pressurized compartments.

The third bomber event of the year was the flight of the *Pacusan Dreamboat,* an Army Air Forces Boeing

B-29 Superfortress, which left Hickam Field, Hawaii, for Cairo, Egypt at 11:20 a.m. (Washington time) Oct. 4 in an attempt to fly approximately 10,000 miles non-stop. The bomber flew the Great Circle route, making its initial landfall at Juneau, Alaska, thence across the polar wastes and the North Polar region to Iceland, London, Paris, Foggia (Italy), and across the Mediterranean to Cairo. The plane landed in Cairo on Oct. 6, completing the non-stop flight in 39 hours, 36 minutes.

Pressure Suits.—Resembling a deep-sea diver's suit, supplemented by a goldfish bowl, this suit makes it possible for air crew members to ascend to 62,000 feet without loss of bodily functions. It counteracts the loss of external pressure in high altitudes.

"Operation Anopheles". — Using specially equipped Douglas C-47 planes, the Army Air Forces launched an operation in July against the deadly Anopheles mosquito. Flying at tree-top level, the C-47's sprayed swampy, mosquito-infested areas with a special solution of DDT. The aim was that of decreasing the malarial potential at mosquito-bound Army installations.

"Jato".—This is the Air Force name for a rocket motor to assist transport aircraft take-offs. With the aid of four Jato units, installed under the wing, a Douglas C-54 Skymaster took off after a ground run of less than 700 feet, whereas the normal distance is 3,000 feet. Each rocket unit, using the rapid expansion of heated gases to provide its thrust, produces 333 horsepower at 90 miles per hour for approximately 12 seconds.

Communications System.—Established officially Nov. 1, this new system will result in an annual savings of about $2,000,000. Nine Army Air Force Flight Service Centers were established: Olmstead Field, Pa.; Macdill Field, Fla.; Wright Field, O.; Maxwell Field, Ala.; Fort Worth, Tex.; Lowry Field, Col.; March Field and Hamilton Field, Calif.; and McChord Field, Wash. All centers are connected by Bell Telephone System Teletypewriter Exchange Service and the new network will include all Army Air Force radio ranges, high frequency direction-finding stations, Air Rescue Services, and the Civil Aeronautics Administration Communication System.

Fire Fighting and Rescue Equipment.—To meet new conditions and the demands of new equipment, the Air Force has modernized its fire fighting and rescue equipment. To provide swift entry to steel and aluminum fuselages of planes which have crashed, there is a new Forcible Entry Kit, containing powerful circular and push and pull saws. A new type winch provides tremendous force for a grappling hook. All powered equipment is mounted on a jeep which carries a three-kilowatt generator driven by a jeep engine. The unit includes crow-bars, axes, cutters, and other hand tools made of "non-sparking" materials so that spilled oil or gasoline at the scene of the crash may not be ignited. The unit also includes two walkie-talkie radios, a folding ladder, protective clothing for the operator, and two cylinders of carbon-dioxide. Large trucks carrying smothering "foam" clear paths through severe fires to enable the rescue crews to get in close and they also blanket the men with "fog" to keep them safe from flames while working.

Lycoming Engine.—The world's most powerful reciprocating aircraft engine, the Lycoming XR-7755, was produced at Williamsport, Pa. It develops 5,000 horsepower at take-off, a power equivalent to that of a modern railway locomotive. It has 36 cylinders in four banks of nine each and combines high power output necessary for take-off with low fuel consumption necessary for range.

Civil Air Patrol.—Federal appropriations were not available for this unit after March 31, 1946. However, its war services were formally recognized by the granting of a Federal charter, signed by President Truman on July 1. It thus acquired the same status as other patriotic, public service organizations like the Red Cross. The Civil Air Patrol had been formed originally in 1941 under the War Powers Act.

CAVALRY

Secretary Patterson, speaking at Fort Riley, Kan., announced that the old historic cavalry arm of our fighting forces was to be merged with the comparatively new armored force. The new, single unit is designated as "Armored Cavalry." During the Second World War, the cavalry was not organized into combat formations of the historic horse-borne type and the only large unit to see service was the 1st Cavalry Division which fought in the Philippines and occupied Tokyo after the Japanese surrender. However, they fought as "Dismounted Cavalry," so that their employment was similar to infantry.

ARMY ENGINEER CORPS

This was an extremely busy year for the Army Engineer Corps, especially in getting under way the Veterans Administration hospital building plan. Aside from hospital contracting, the Engineer Corps was concerned with many other items of general interest. The Corps undertook the construction of post-war Army facilities in Alaska at a cost of $25,000,000, and the development and construction of five and possibly six permanent Reserve Fleet sites for the United States Maritime Commission, which has made $10,000,000 available for this job. The five assured sites are located in the James River, at Lee Hall, Va.; Brunswick River, Wilmington, N. C.; Tensaw River, Mobile, Ala.; Neches River, Beaumont, Tex.; and Suisun Bay, Benicia, Calif. The sixth site under consideration is one of two located in the Columbia River area.

From VJ-Day to June 1, 1946, the Engineers let civil works contracts for more than $91,000,000. These projects were scattered throughout 39 states and ranged in money value from $10,000 to $21,000,000.

Some of the Veterans Administration hospital contracts let by the Engineer Corps during 1946 were for hospitals: Big Springs, Tex.; Seattle, Wash.; Wilkes-Barre, Pa.; Wilmington, Del.; Omaha, Neb.; Fresno, Calif.; Miles City, Mont.; Iron Mountain, Mich.; Decatur, Ill.; Shreveport, La.; Durham and Charlotte, N. C.; Oklahoma City, Okla.; Toledo, O.; New Orleans, La.; Klamath Falls, Ore.; Dallas, Tex.; El Paso, Tex.; Tupelo, Miss.; Little Rock, Ark.; Tallahassee, Fla.; Providence, R. I.; Bonham, Tex.; Peekskill, N. Y.; Jefferson Barracks, Mo.; Minneapolis, Minn.; Houston, Tex.; Greenville, S. C.; Washington, D. C.; Dallas, Tex.; Norman, Okla.; Duluth, Minn.; Gainesville, Fla.; New York, N. Y.; Madison, Wis.; Sioux Falls, S. D.; Minot, N. D.; Grand Junction, Colo.; Americus, Ga.; and Erie, Pa.

ARMY MEDICAL CORPS

Streptomycin.—This drug was clinically tested at Halloran General Hospital where it was found to be effective against more than half the infective bacteria generally encountered. During the year, the Civilian Production Administration effected better distribution of the available amounts of the drug so that quantities needed for treatment of civilian cases need no longer be requisitioned from the Army Medical Department.

Dengue Fever. — The Commission on Neurotropic Virus Diseases announced that an effective vaccine had been secured against dengue fever. It was found that this malady, which occurs in epidemics and sometimes pandemics throughout the warmer portions of the temperate zone, is owing to a filterable virus first isolated in Hawaii by Army doctors. It was then brought to the mainland where it underwent consecutive passages through the brains of mice before the vaccine was produced.

Venereal Disease. — This disease reached a high of 69 men per thousand per year in the Army during 1945. In 1946, figures released were: United States, one of every 1,000 troops; European Theater, one of every 200 troops; Western Pacific

Area, one of every 333 troops; total overseas rate, one of every 250 troops. To cut down loss of man-hours in the Army caused by this illness, a group of 36 skilled military preventive medicine officers attended 32-weeks' courses in Harvard and Johns Hopkins Universities. Graduated from these courses, these disease detectives, armed with the latest techniques in ferreting out sources of endemic diseases, took to the field to prevent, curb, and treat such illnesses. In Korea, Japan, and Germany, they took an active part in the Army's measures to stamp out venereal-breeding dens.

Nurses.—The Surgeon General set up recall-to-duty quotas for 1,000 nurses and 100 medical administrative officers during July. This was done to ensure the best possible care to some 90,000 patients remaining in Army hospitals.

Carbon-14. — In August, Manhattan Engineer District, key organization in the development of the atomic bomb, shipped from Oak Ridge, Tenn. the first radioactive isotopes to the nation's research institutions. These first peacetime products of the Government's atomic energy facilities were pea-sized units of Carbon-14. These, for the next 10.000 to 25.000 years will emit 37,000,000 beta particles per second, and will be used in research in connection with cancer, diabetes, photosynthesis, carbon deposition in the teeth and bones, and in the utilization of fats by the human body.

Technicians. — The Surgeon General stated that the number of technicians trained during the Second World War, July, 1939 to June, 1946. was 114.997. Twelve general hospitals and medical centers of the Army offered courses for enlisted technicians in X-ray, veterinary medicine, medicine, surgery, dentistry, laboratory, pharmacy, meat and dairy inspection, orthopedic machinery, medical equipment maintenance, and sanitation.

ALCAN HIGHWAY

April 3 ceremonies at Whitehorse, Yukon Territory, marked the taking over by Canada from the United States of the Alaska highway, the airfields on the Northwest Staging Route, the telephone system from Edmonton to the Alaskan border, and other defense projects in the Northwest.

ATOMIC RESEARCH

Army experts participated actively with Navy experts in Operations Crossroads, the Joint Army and Navy atomic bombings at Bikini Atoll which tested the reaction to atomic blasts to materiel and ammunition items as well as vessels which carried them.

The War Department made a contract with the General Electric Company for atomic research and development. This also included the transfer of responsibility for operation of the $347.000,000 government-owned plant at Hanford, Wash., from E. I. du Pont de Nemours and Co.

The Department backed a cooperative effort by the Air Force and the Manhattan Engineering District to attempt to solve the problem of using atomic energy for the propulsion of aircraft.

Plans were announced for the establishment of a $20,000.000 nuclear research laboratory near Schenectady, N. Y., for the study of power generation from atomic energy. This is to be known as the Knolls Atomic Power Laboratory, the fourth in the network of such laboratories. The other three are the Clinton Laboratory at Oak Ridge, Tenn.; the Argonne National Laboratory at Chicago; and the Brookhaven National Laboratory on Long Island.

The Atomic Energy Commission took over the organization and properties of the Manhattan Engineer District, the War Department atomic energy agency on Jan. 1, 1947.

CASTE SYSTEM

A Board headed by Lieut. Gen. James H. Doolittle made recommendations for improvement of relationships between officers and men of the Army. Recommendations were: (1) improve leadership in the Army; (2)

take steps to provide all military personnel with a sense of security, substantial compensation for duty, and responsibility from bottom to top, equitable distribution of allowances, and assurance of a chance for advancement; (3) allow enlisted men to accumulate leave or furlough time and be granted terminal leave pay on the same basis as now provided for commissioned personnel; (4) that all military personnel when off duty pursue normal social patterns comparable to our democratic way of life; (5) that there be no discriminatory references as between officers and enlisted men and their families; (6) definite equality of treatment of both enlisted and commissioned personnel in the administration of military justice; (7) abolition of the hand salute away from Army installations and off duty; (8) establish a system of decorations and awards which will provide a more equitable distribution on the basis of merit and prohibit distribution to a degree that will tend to cheapen them; (9) improve system for registering complaints; (10) so word regulations as to prohibit or minimize possible abuses of authority and the prestige that goes with higher rank and responsibility; (11) abolish all statutes, regulations, customs, etc., discouraging or forbidding social associations of soldiers because of military rank; (12) eliminate the terms "enlisted men" and "officers"; (13) encourage close contact and association with civilians.

CASUALTIES

Casualty statistics were released by the War Department in May to cover the period from Dec. 7, 1941 through Feb. 26, 1946. The number of Army battle deaths was set at 229,238 for all theaters, and the total number of battle casualties of all types, including wounded, injured, captured, and missing was set at 948,418. The European Theater, with the greatest manpower, suffered the highest number of casualties in all brackets—592,074. The Mediterranean Theater was second with 178,602. The two were followed in order by the Pacific Theater, China-Burma-India Theater, Africa-Middle East, United States Army Strategic Air Force, the Alaskan Department, and the Caribbean and South Atlantic areas. A total of 835 battle casualties, including 548 deaths, was listed as en route and not chargeable to any command.

CONTRACTS

By July 15, the War Department had achieved final settlement of 97.4 per cent of terminated contracts. In November, Under Secretary Kenneth C. Royall announced the establishment of a centralized audit agency to perform, on an Army-wide basis, all War Department internal audit functions in the fields of contracts, property administration, military property accounts, and payroll records. This is expected to assure standardization and uniformity of property operations.

COSTS

The cost of maintaining and equipping a soldier for his first year in the Army in continental United States is now $590.68 or $125.42 more than the same cost in 1944. The total sum is broken down as follows: Food, $233.92; Clothing, $237.16; Individual equipment, $56.18; Barrack equipment, $63.42.

SCOUT DOGS

On the basis of the Second World War experience, the War Department decided to concentrate on German shepherd dogs for scout service training. The Army Dog Association was formed to secure dogs of this breed which would meet the Army's rigid requirements. Initially it was planned to train four Scout Dog Platoons of 27 dogs each. Training points are located at Camp Campbell, Ky., Fort Bragg, N. C., Fort Lewis, Wash., and Fort Riley, Kan.

SERVICE EDUCATION

In January, 90 selected Army and Navy officers were enrolled in the first post-war course in industrial mobilization at the Army Industrial College. (In May the name of this school was changed to Industrial College of the Armed Forces.) In the same month, an Army Information School was established at Carlisle Barracks, Pa., to train officers and enlisted men as specialists in public relations and in information duties. In order to provide space for this new school, the Medical Field Service School was moved from Carlisle, Pa. to Fort Sam Houston, Texas.

In March, 1946, for the first time. Second World War veterans up to 24 years of age, sons of deceased veterans of the Second World War, and sons of Congressional Medal of Honor men were allowed to participate in the annual entrance examinations for admission to the U. S. Military Academy at West Point.

On Feb. 5, 1946, the War Department's School of Civilian Personnel Administration graduated 45 officers who had completed courses in better standards of personnel practice.

All Signal Corps school work was consolidated at Fort Monmouth N. J. This required, among other things, deactivation of the Central Signal Corps School formerly located at Camp Crowder, Mo., and reactivation of the Enlisted Men's School of the Eastern Signal Corps Schools.

A new Ordnance School was organized at Aberdeen Proving Ground, Md., to train men in all types of ordnance work in courses of six to nine months. The Army Ground Forces Replacement and School Command was moved from Birmingham, Ala. to Fort Bragg, N. C. The Army Air Forces Special Staff School at Orlando, Fla. graduated its first class of public relations officers on March 1. 1946.

The Secretary of War approved a new post-war curriculum for the U. S. Military Academy. The four-year course was reestablished, provision was made for basic collegiate courses, and branch specialization, including aviation, was relinquished to the post-graduate special service schools.

Arrangements were made whereby some 90 correspondence and self-teaching courses, prepared by the United States Armed Forces Institute, will be made available to personnel in veterans' hospitals.

Beginning in March, 1946, a series of ten lectures on nuclear physics was given to Army Air Force personnel in the Pentagon Building, Washington, D. C. by distinguished scientists.

NATIONAL WAR COLLEGE

The Army and Navy Staff College was redesignated as the National War College on April 1. This is now the highest level educational institution of the armed forces and the State Department. The staff of the new school, located in the old Army War College building in Washington, D.C., is made up of officers of the armed forces and outstanding personnel of the State Department. The first course of instruction began on Sept. 3 and covered a wide range of civilian subjects pertinent to national planning and national defense, including a study of foreign policy, international law, and international relations.

TRAINING AND RESEARCH

A new School for Government of Occupied Areas was opened at Carlisle Barracks to train eventually 2,400 officers and key civilians for military government duties in Europe and the Far East.

The first post-war session of the three-months' course at the Army Chaplains School, Fort Oglethorpe, Ga., closed May 1, 1946. The course was designed to give chaplains a better idea of their peacetime job with the Army.

In May, Secretary of War Patterson announced the creation of a Research and Developments Division of the General Staff to coordinate Army research with the activities of industry and educational institutions.

The Army Air Forces opened a school for musicians at Bolling Field, D. C. It is designed as a clearing house for the 34 Army Air Forces bands scattered throughout the country.

The Coast Artillery School, founded in 1824, was moved during June from

Fort Monroe, Va., to Fort Winfield Scott, Calif.

ARMY FOOD SERVICE SCHOOLS

Army Food Service Schools opened their first classes July 10. Formerly this schooling was known as Army Bakers and Cooks Schools. Four leading schools cooperated with the War Department in training officers in the scientific problems involved in research and development of food products and food containers used by the Army. Provision was made to include a course in mess management in the West Point curriculum for 1947.

ARMY GROUND FORCES

Six Army Ground-Forces Schools were reorganized in November. They were Airborne School, Fort Benning Ga.; Coast Artillery School, Fort Winfield Scott, Calif.; Antiaircraft School, Fort Bliss, Tex.; Air Training School, Fort Sill, Okla.; and the Cavalry and Intelligence Schools, both at Fort Riley, Kansas.

Army Ground Forces completed arrangements for sending approximately 400 officers yearly to the nation's leading schools and universities for advanced study.

ELECTRONICS

An interesting development in this field was publicly released for discussion in January, 1946. The War and Navy Departments jointly suggested a procedure for removal of barriers against utilization by the radio and electrical manufacturing industries of valuable wartime developments in electronic techniques, equipments, and manufacturing processes. Recommendations were made that a cooperative, non-profit organization be established to administer electronic patents resulting from the radar program and to license manufacturers to take advantage of these developments. This procedure was, of course, out of the question in wartime.

Possibly the most interesting electronic device of the year, construction of which was begun in 1943, is known as ENIAC (Electronic Numerical Integrator and Computer) and is really a large-scale electronic general purpose computing machine. Occupying a room 30′ x 50′, ENIAC weighs 30 tons and has 100 feet of front panels. It is the most intricate and complex electronic device in the world and requires 18,000 electronic tubes for its operation. Its construction was begun at the request of the Ordnance Department to break a mathematical bottleneck in ballistic research. ENIAC is the invention of Dr. J. W. Mauchly and J. Presper Eckert, both of the Moore School of Electrical Engineering of the University of Pennsylvania where the machine was built.

FERTILIZER FOR FOREIGN COUNTRIES

Fifteen Army Ordnance plants were converted, as a temporary measure, from the production of explosives to the manufacture of nitrogen fertilizers for shipment to starving countries to increase the growth of food. Under full production, these plants can produce 70,000 tons of ammonium nitrate per month.

FOG RESEARCH

A joint experimental and research project to test landing aids under adverse weather conditions was set up by Army Air Forces and Navy Bureau of Aeronautics at the Naval Auxiliary Air Station, Arcata, Calif. FIDO ("Fog Intensive, Dispersal Of") systems, so valuable in the British Isles during the Second World War, were completed and flight-tested at Arcata.

FOOD RATIONS AND TESTS

A new 5-in-one ration, consisting of five rations in one package, was developed by the Quartermaster Corps to feed small groups of soldiers separated from their kitchens. The ration contains from 3,566 to 4,056 calories. When packaged it weighs 25 pounds, a suitable size to be animal packed or man-carried, and it may be parachute-dropped with a minimum of damage to package or contents. This package will provide enough food for five men for one day, and the ration has been found to be stable under divergent climatic conditions.

Tests made at Chicago proved that fresh frozen pork sausage prepared without salt keeps better than that prepared with salt. The tests indicated that seasonings other than salt had but little effect on the development of rancidity in the sausage during freezing, storage, and cooking.

During the year, regular shipments of frozen whole milk were made to troops in Pacific Area hospitals, to Regular Army messes, and to hospitals in the American occupied zone in Germany.

IMPORTED HORSES

A second shipment of 100 of the finest brood mares and stallions in the European Axis countries reached the United States in August. Most of these animals were captured from the German Wehrmacht by the American Army of Invasion.

ARMY HOUSING

In an effort to alleviate the acute housing shortages, the War Department, through the Corps of Engineers, converted many existing barracks and other buildings into family units. Camp Shanks, wartime staging area at Orangeburg, N. Y., was one of the first to be marked for such purposes. New Army construction to the value of $9,316,000 was deferred in order to turn more supplies to civilian building. Along with this went the use of $44,965.000 to provide essential construction of housing within posts. camps, and stations in critical areas of the United States for military personnel and their families now living in overcrowded neighboring communities. The Army's mission in occupied areas and overseas bases, particularly in the Pacific, was greatly impeded by the housing shortage. From the Philippines it was reported that it was only possible to accommodate 30 per cent of the dependents who wished to join troops there.

MANEUVERS

Using the experience of 162 separate combat amphibious operations in the two theaters of the Second World War, the Army Ground Forces, in conjunction with the Army Air Forces, perfected plans for a division-scale maneuver from Sept. 1 to Dec. 1. During part of this exercise, Army forces participated in amphibious exercises conducted by the Commander Amphibious Force, U. S. Pacific Fleet. The joint Army-Navy amphibious operations in the San Diego—San Clements Island—Oceanside area of southern California were the only war exercises of the Army in the United States for the year.

MUNITIONS

One of the leading heavy weapons was the self-propelled 240-mm howitzer, shown at the Fort Sill Artillery Conference in March, 1946. In October, a weapons show staged at Aberdeen Proving Grounds, Maryland, revealed considerable progress in new weapons. Among these were the caliber .60 machine gun; the 75-mm. and 105-mm recoilless rifles; the M 1 rifle modified for full automatic fire as well as semi-automatic; a new VT fuse; a new high-power antiaircraft weapon, the multiple gun motor carriage T-77 mounting six, caliber .50 machine guns; a new tank, the T-28, weighing nearly 100 tons and mounting a 105-mm. gun and a .50-caliber machine gun; and a 75-mm. automatic gun for airplanes, giving the plane greatly increased firepower.

There was considerable experimentation at White Sands, New Mexico, with all types of rockets, particularly the captured German V-2 type. A guided missile GAPA (Ground-to-Air Pilotless Aircraft) was revealed to the public. It is a pencil-slim, ten-foot projectile which, when perfected, will be capable of seeking out and destroying possible weapons before they can register on their targets. The further trend of experiments during the year indicated that Second World War high explosive bullets and projectiles will be replaced in the future by high-speed metallic jets capable of traveling at an initial velocity of 25,000 feet per second.

Many of the newer items of munitions and quartermaster supplies were undergoing tests in the closing months of the year under frigid Alaskan weather conditions. Three task forces, totaling 4,500 men, were assigned to this job, and the forces were known as "Frost," "Frigid," and "Williwaw," respectively.

NATIONAL GUARD

Total strength of the post-war National Guard was set at approximately 622,500 officers and men. The aggregate of National Guardsmen inducted into Federal service prior to the Second World War was 300,034. In the post-war Ground Forces of the National Guard the principal units will be about 22 infantry divisions, two armored divisions, and some 18 regimental combat teams. The post-war Air Forces will include 12 wings, 27 groups, and 84 squadrons, along with 12 control and warning groups.

In the capitals of 45 states, Puerto Rico, and Hawaii, on Armistice Day National Guard colors and guidons carried in the Second World War were returned to approximately 3,000 National Guard units with appropriate ceremonies.

MILITARY OCCUPATION DEVELOPMENTS

General MacArthur in Japan reported that the people of that nation were developing a sense of political responsibility, one of the first steps towards building a true democracy.

In Austria, General Mark Clark made steady progress in all fields of reconstruction, particularly in restoring rail and water traffic routes.

General McNarney granted amnesty to about 800,000 "little Nazis" within the American zone of occupation in Europe.

In all the theaters of occupation. along with the heavy work of reconstruction went the task of destroying the criminals responsible for the war.

ARMY OFFICERS

Statistics released during the year showed that more than 500,000 enlisted men became officers during the Second World War. Between Dec. 7, 1941 and Sept. 2, 1945 there was an aggregate of 872,000 male commissioned officers in the Army. Of these, 72,000 were medical officers and chaplains. Of the remainder, 66.37 per cent were commissioned after serving as enlisted men. There were approximately 67,000 female officers in the Army. Of these, 60.000 were medical personnel, nearly all of them nurses. The remaining 7,000 were officers of the Women's Army Corps, practically all of whom rose from the ranks. During the year, officer strength was raised successively until, by September, the original increase of 25,000 had been raised to 50,000.

ORGANIZED RESERVE CORPS

During the summer, activation of Organized Reserve Corps Units was begun. War Department planning for this Corps provides that the units will be organized under three classifications: (1) war strength units with a full complement of officers and enlisted men, supplied with all essential equipment required for training and initial mobilization; (2) units with a full complement of officers and a cadre of key enlisted personnel and essential training equipment; and (3) units with an assigned complement of officers only. Under this plan, activation under the third class was begun in the six Army areas on July 1. On Nov. 9, General Devers announced that 116 ground or technical service type units had already been activated.

PANAMA CANAL

In January 1946, the War Department announced the first routing of a large ship from the Philippines direct to New York, through the Panama Canal. This was the *West Point,* formerly the *America,* largest and fastest United States passenger liner ever built. On this trip she carried 7,500 American troops. The only other troopship which had been thus routed to date was the *Explorer,* carrying 2,150 troops, which left Nagoya, Japan on Dec. 10, 1945 and arrived in

New York, Jan. 3, 1946. Shipping is now surplus on all oceans, and by routing troops direct to east coast ports, as these two vessels sailed, considerable pressure was taken off continental railway lines from San Francisco to New York.

ARMY PAY

As a measure to encourage recruiting of enlisted men and to pay officers in rates more commensurate with the professional requirements demanded of them, new pay schedules were set up during the year. Previous legislation in 1942 had raised pay of privates from $21 a month (1922 scale) to $50 a month. The latest legislation took this basic rate up to $60 a month.

The Armed Forces Leave Act of 1946, signed by the President on Aug. 16, equalized the leave benefits of officers and enlisted men and brought an estimated $2,700,000,000 in cash and interest-bearing five-year bonds into the pockets of about 15,000,000 former Army, Navy, Marine Corps, and Coast Guard members. The basic law regarding leaves dates from 1874, and, prior to this present enactment, it had been last amended in 1876. Essentially, the new law gives officers and enlisted men and women of all services identical leave rights and limits the amount of leave, which any individual may accrue, to 60 days.

PRISONERS OF WAR

The last Japanese prisoners of war left the United States on Jan. 9, 1946. A total of 5,431 Japanese war prisoners had originally been interned in this country, held in the two principal camps of McCoy, Wis. and Clarinda, Ia.

Between the spring of 1942 and July 22, 1946, when the final group of able-bodied prisoners of war was shipped out for repatriation, there were brought to this country as prisoners a total of 378,898 Germans. 51,455 Italians, and 5,435 Japanese. After the July 22d repatriation shipment, there remained in the United States 140 Germans, 15 Italians, and one Japanese serving Federal prison sentences for crimes committed while interned; 81 German and three Italian hospital patients, too ill to be moved; and 28 German and 15 Italian escapees still at large. While held here, scattered among 155 base camps and more than 500 branch camps, these prisoners were widely used for essential work on military installations and in private contract labor in agriculture, lumbering, food processing, and other vital industries suffering from acute labor shortages.

RADAR

Army Signal Corps scientists at the Evans Signal Laboratory, Belmar, N. J., made radar contact with the moon on Jan. 10, 1946. The equipment used for this experiment comprised extensive adaptations to a standard wartime Signal Corps radar known as Radio Set SCR-271, originally designed in 1937 for long-range early warning against enemy air attack. It was an early model of this set which detected Japanese planes approaching Pearl Harbor on Dec. 7, 1941 while they were still over 100 miles away. The moon-reaching radar was operated at its standard frequency of 122 megacycles; its alternating-current radio waves made 112,000,000 complete cycles per second, but the pulse repetition rate and pulse width were extended beyond the usual standards. Instead of sending out several thousand spaced pulses each second, the modified radar transmitted a pulse only every five seconds. The pulse width was increased from a few billionths of a second to as much as one-half second. This equipment, therefore, sent out a half-second pulse of radio energy every five seconds. To prevent the set from being burned out by the enormous pulse power it had to generate, water-cooled vacuum tubes were used.

To acquaint the general public with the use of radar in wartime, Major Gen. Henry C. Ingles, Chief Signal Officer of the Army, explained some of the uses of radar in combat. He told how specially adapted Signal

Corps radar was used to obtain accurate oscilloscope bearings on both the upward and downward paths of enemy projectiles, and how the entire trajectory of the shell was plotted from these bearings and extended geometrically to indicate the exact location of the gun. Radars used to detect enemy night traffic had the uncanny faculty of being able to track all moving objects in the area covered by the radar beam. Vehicular targets were detected by radar at ranges up to 16 miles, individual troops were detected at ranges up to three miles, and radar technicians became so proficient they could estimate the number of enemy soldiers in a group and the type and speed of enemy vehicles.

Radar was used in this country in an attempt to track the German V-2 rockets which were fired for testing at White Sands. The purpose was to try to keep a finger on these 3,000-miles-per-hour missiles as they arched across the sky. If this experiment eventually proves successful, then some means can readily be devised of exploding the V-2's harmlessly in mid-air before they can reach their targets.

Lightweight airborne radar equipment was used for the first time when a C-54 flew from Westover Field, Mass. to Paris, France. The Air Forces indicated that some of the contributions to the safety of flights made by the use of this lightweight airborne radar are: (1) ability to "see" turbulence and dangerous storm conditions on the flight path and therefore avoid them; (2) a method of accurate, short-range position fixing, made possible by employment of radar beacons; (3) an anti-collision device effective during instrument and night flying; (4) an obstruction warning device for the avoidance of mountains and other terrestrial obstructions.

As of January, 1946, the Army Air Forces stated that approximately 20,000 successful landings had been accomplished through the use of radar ground-controlled approach landing-systems for aircraft during fog conditions and periods of absolute minimum visibility.

RECRUITING

When Congress passed the Armed Forces Voluntary Recruitment Act of 1945 on Oct. 6 of that year, the recruiting program got under way. Major Gen. Harold N. Gilbert, in charge of the program, announced that it was necessary to "Make It a Million" to meet the Army's immediate personnel needs. On Oct. 18, 1946 the attainment of the million mark was observed in ceremonies in the office of the Secretary of War. At that time, Major Gen. Witsell, the Adjutant General, cautioned that, whereas the million mark had been reached, it must be kept in mind that half of the Army's enlisted strength would be eligible for discharge by the summer of 1947. He thus showed the necessity of maintaining an average voluntary enlistment rate of 40,000 men a month.

An entirely new venture in recruiting was announced in October. In order to bring skilled personnel into the United States Army and also to offer the Army as a career to many men heretofore barred from such an opportunity because of disability caused by honorable service, the War Department announced that certain categories of disabled veterans would be accepted for enlistment in the Regular Army. Richard Montgomery, 29 years old, of Pittsburgh, Pa., was the first disabled combat veteran to reenter the Army under this provision. He had been an Air Force Master Sergeant in the Second World War and lost his left arm in aerial combat over Rangoon.

ARMY REORGANIZATION

In line with reduction of the Army from a peak strength of more than 8,000,000 to 1,550,000, the War Department, as of June 11, put into effect a major reorganization of the War Department and the Army. The functions formerly assigned to the Services of Supply or the Army Service Forces were ordered reassigned to other units and the former-named Services were abolished.

The former military organization. designed for global war functioned admirably for that purpose. However, the transition from war to peace and the reduction in size and scope of activities of the Army made major reorganization a necessity in many more lines than the abolition of the Army Service Forces previously indicated.

Under the new reorganization, duties of the Secretary of War, the Under Secretary, and the Assistant Secretaries remain practically unchanged. The authority of the Chief of Staff was considerably broadened. A new unit, the Research and Development Division, was added to the General Staff, and heads of General Staff Divisions were henceforth to be known as "Directors" instead of "Assistant Chiefs of Staff." Autonomy of the Army Air Forces was increased, and the authority of the Commanding General, Army Air Forces, was increased with respect to administrative, operational, command, research, procurement, and budgetary activities. Air bases and other installations in continental United States are designated to operate under air commands set up by Headquarters, Army Air Forces.

In the field, Eastern and Western Defense commands and the nine service commands, as such, were discontinued. Their functions were taken over by Army Commanders. The head of the Army Ground Forces, General Jacob L. Devers, was placed in command of the six Armies located in continental United States. As originally set up under this reorganization plan, Army Commanders were: First, General Courtney H. Hodges; Second, Lieut. Gen. William H. Simpson (succeeded by Lieut. Gen. Albert C. Wedemeyer); Third, to remain on occupation duty in Germany; Fourth, General Jonathan Wainwright; Fifth, Lieut. Gen. Walton H. Walker; Sixth, General Joseph W. Stilwell (succeeded by Major Gen. Geo. P. Hays); Seventh, recently inactivated in Germany and to be reorganized in the United States in Third Army Area.

The reorganization plan continued the Military District of Washington as a separate command. The territory in each of the six new Army areas embraced the following state groups: First, New England, New York, New Jersey, Delaware; Second, Pennsylvania, Maryland, Virginia, West Virginia, Ohio, Indiana, Kentucky; Third, Tennessee, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi; Fourth, Arkansas, Louisiana, Oklahoma, Texas, New Mexico; Fifth, North Dakota, South Dakota, Minnesota, Wisconsin, Michigan, Illinois, Iowa, Missouri, Nebraska, Kansas; Sixth, Montana, Idaho, Utah, Arizona, Nevada, Washington, Oregon, California.

RESERVE OFFICERS TRAINING CORPS

In May 1946, the War Department announced approval of a post-war policy for this unit, making provision for military training in two divisions, the Junior ROTC at approximately the secondary school educational level and the Senior ROTC at the junior college and college level. In so far as existing law and appropriations permitted, the program was put into effect with the start of the fall school term of 1946. By April 22, approximately 330,000 officers of the Army had accepted commissions in the Officers Reserve Corps and more than 370,000 enlisted personnel had enlisted in the Enlisted Reserve Corps.

SALVAGE AND SURPLUS

In January 1946, the War Department announced that ferrous scrap, except that located in United States-occupied Germany and Japan, would be returned to the United States only to the extent required for ship ballast. Aluminum scrap was disposed of locally overseas. Copper and brass scrap was returned to the United States from all overseas commands except France, Belgium, England, and The Netherlands where it was disposed of locally to assist in civilian rehabilitation.

Napalm, powerful incendiary agent on the battlefield, was used successfully to make a fine grade of soap.

On Dec. 15, the War Department announced that the Army was virtually up-to-date on disposition of surplus wartime equipment in the United States. Dispositions of domestic surplus to that date, exclusive of real estate, totaled $21,000,000,000, of which $7,000,000,000 was disposed of directly by the War Department and the remainder declared to disposal agencies. The largest single item turned over by any Technical Service for disposal was trucks. More than 132,000 trucks, excluding jeeps, with a value of about $195,000,000 were declared surplus.

ARMY TRAINING PROGRAMS

By mid-summer, training programs were well under way in the Army. The Army Forces established 40 Air Reserve training bases to start their program. Intensive post-war Ordnance training got under way at Army Ordnance Department's installations and at various universities throughout the country. In order to standardize officer training for the ground arms and services, a new Army Officer Candidate School program was established at Fort Benning, Ga., in July. Army officers, other than those assigned to the Air Forces and who have had comparatively short terms of active service, will be given an opportunity to round out their military education through an established supplementary education and training program. This calls for instruction at a division, base, or similar level and will extend over a period of six months. Primarily, the program was established to benefit officers, commissioned in the Regular Army since 1940, lacking experience or instruction at service schools.

Army Ground Forces announced that, as of Nov. 10, it would assume responsibility for the recruit training of all Army enlisted men, other than Air Forces.

UNIFORMS

After June 30, 1948, officers and men of the Army will dress alike. This move also paves the way for eventual adoption of dress blue uniforms for officers and men provided they can be procured and manufactured without interfering with the production of civilian clothing.

UNIVERSAL MILITARY TRAINING

One year of military training for all physically and mentally fit young men of the nation between the ages of 17 and 20, to include six months of intensive military and technical specialist training and an additional six months or equivalent in one of eight other categories, was announced on Oct. 3 as the basis for the War Department plan for Universal Military Training. Speaking before the Reserve Officers Association in Washington, D. C., on Nov. 22, Secretary Patterson said, among other things: "Had Congress in 1920 enacted the universal military training proposed, the United States would have had nine million trained reserves when Japan invaded Manchuria; ten million when Hitler rose to power; twelve million when Mussolini invaded Abyssinia; fourteen million when Germany invaded the Rhineland; sixteen million when the Nazis seized Poland. The world's warmongers would never have gone forward with their design for world rule had we had available an effective trained reserve. War would have been averted."

WOMEN'S ARMY CORPS

In March, the War Department offered overseas service to enlisted personnel of the WAC who wished to stay in service. Openings were made available in the European Theater for 600 women in five specialist categories. In July, plans were effected by the War Department to put the Women's Army Corps on an entirely volunteer basis as of Oct. 1, 1946. On July 24, Senator Elbert Thomas, Chairman of the Senate Military Affairs Committee, introduced into the

Senate the "WAC Integration Act of 1946." This established the Women's Army Corps in the Regular Army. The bill, as introduced, called for an initial Corps strength of 5,000 enlisted women and 500 officers, and established the maximum strength at two per cent of the Regular Army male strength authorized from time to time. In September, an 8-weeks' clerical course for WAC personnel was opened at the Quartermaster School, Camp Lee, Virginia.

WEATHER TESTS

In the thunderstorm season of the tropics, Army Air Forces conducted a series of intensive flight tests to provide fundamental data for flying through major weather hazards. Specially equipped Northrop P-61 Black Widows, wartime night fighters, flew around and through thunderstorms in the area around Orlando, Fla., collecting instrumental and photographic observations relating to cloud forms, cloud heights, turbulence, precipitation, lightning, and temperature.

Air Forces also worked to increase its six storm detection radar stations to 35 by the end of the year. In conjunction with the Signal Corps, the Air Weather Service of the Air Forces worked for the extension of aircraft weather reconnaissance and research in weather of the upper atmosphere. The use of rockets and guided missiles calls for special investigations of stratosphere weather and for special weather studies in such fields as electronic instruments, the use of electronic computers as an aid to forecasting, and special techniques for weather forecasting.

A complete "weather-station-on-wheels" mounted on a truck which can be driven to any location accessible to six-wheel drive trucks was perfected by the Signal Corps to answer the Army's demand for more and faster weather data. This weather station is known as Mobile Meteorological Station SCM-1.

On Sept. 1 there began the daily photo-transmission of weather maps from the Air Weather Service Central at Fairfield-Suisun Airport, California, to Hickam Field, Hawaii. For six hours of every day, isobars, isotherms, and all other special information incorporated on weather maps were sent by radio photo-transmission channel across more than 2,000 miles of the Pacific Ocean.

ADMINISTRATION OF VETERANS AFFAIRS

By Omar N. Bradley

General, U.S.A.; Administrator, Veterans Administration

ORGANIZATION

The Veterans Administration was established by the Act of July 3, 1930 (46 Stat. L, 1016) to unify the work of various Federal bureaus administering direct benefits to veterans and their beneficiaries. An independent Federal agency, it is headed by an Administrator of Veterans Affairs, and it entered the American scene at the beginning of a severe business depression. The effect of the depression on veterans was displayed in a number of ways.

Veterans were increasingly concerned with assuring themselves of the security of their benefits. For this reason, as well as for the reason of simplicity of administration, the Veterans Administration began to evaluate disabilities on a permanent basis for pension purposes.

Veterans of the First World War began to swell the Administration's rolls during depression days. However, except for former soldiers of the Regular Establishment, veterans of all wars other than the First World War were receiving monetary benefits from VA in decreasing numbers.

The uncertainties and hardships caused by the depression affected the mental and physical wellbeing of veterans, for during that era VA recorded an increasing volume of hospitalization and domiciliary care.

The 4,000,000 First World War veterans, many with physical handicaps, constituted a serious problem during the depression, because of their advancing age and because of the reluctance of commercial and industrial employers to hire older men. VA cooperated with the U. S. Employment Service of the Department of Labor and with other Federal agencies in efforts to find work for veterans.

Many turned to the Civilian Conservation Corps, established in 1933. VA determined veterans' eligibility and certified selectees to the War Department for enrollment in the Corps.

NATIONAL DEFENSE PHASE

The next phase of VA's history pertained to America's national defense program in the days before the Second World War. Because the Army was not fully prepared to meet the medical and hospital requirements of an enlarged military force, the Federal Board of Hospitalization adopted a plan approved by the President in September, 1940, that would utilize the highly trained medical staff and facilities of VA. This program called for VA relinquishing beds it had been using in Army and Navy hospitals, as they were needed by the armed forces; constructing additions to existing VA hospitals for military use; turning over beds in VA general hospitals in maneuver areas temporarily to the Army and Navy; and, in the event of a major national emergency, making available the facilities of VA to members of the armed forces who were injured or disabled in service and whose physical rehabilitation by the Army was not feasible.

These extra obligations, in addition to the agency's legal obligation to provide hospitalization for veterans discharged for disabilities incurred in service or in receipt of pensions, indicated the need for more beds through hospital construction.

However, construction was slowed down during the war because VA, not considered an essential war agency, received a low Federal priority rating; and, because it could not obtain higher priorities, it experienced difficulties obtaining labor and materials. Despite these handicaps, VA erected two new general medical and surgical hospitals during the war at Fort Howard in Baltimore, Md., with 389 standard beds, and at West Roxbury, Mass., with 316 standard beds. VA also increased its potential capacity by converting domiciliary homes to hospital use, by adding more beds to wards, and by additions and modifications to existing hospitals.

Even before war came to America, VA experienced a huge increase in its insurance business, brought about largely by Public Laws 801 and 861, 76th Congress (Oct. 8 and 17, 1940), necessitating a reorganization of its insurance procedures. During the first year of operation of the new laws (through October, 1941), more than 662,000 applications for National Service Life Insurance, representing about $2,285,000,000 were received from armed forces personnel. VA's Insurance and Finance Services were expanded to handle the increase.

SECOND WORLD WAR PHASE

New duties fell to VA, already burdened by increased activities and personnel shortages, when war finally came. Public Law 359, 77th Congress, (Dec. 19, 1941) permitted adjudication of war service claims for pension and insurance benefits and afforded hospitalization to discharged veterans disabled in line of duty. Public Laws 10 and 16, 78th Congress (March 17 and 24, 1943) provided for the rehabilitation of Second World War veterans. In addition, veterans of the Second World War were entitled to hospitalization, domiciliary care, and burial benefits on a parity with First World War veterans.

IMMEDIATE POST-WAR PHASE

Thoughts began to turn to the post-war readjustment of millions of veterans even while Allied forces still were fighting on battlefronts throughout the world. The result was the Servicemen's Readjustment Act of June 22, 1944 (Public Law 346, 78th Congress). The Act, generally known as the G. I. Bill, applied in general to any Second World War veteran discharged under conditions other than dishonorable after 90 days or more of service, or discharged by reason of an injury or disability incurred in line of duty. Broadly, it provided for educational and vocational training aid, guarantee by VA of loans for the purchase of homes and farms or for business purposes, payment of readjustment allowances to unemployed or self-employed veterans, and other benefits.

When Japan surrendered in the summer of 1945 the number of servicemen and women discharged from the armed forces increased with ever gathering momentum. Between October, 1945, and February, 1946, they returned to civilian life at an unprecedented rate of more than 1,000,000 each month. By Nov. 1, 1946, the number of veterans of all wars totaled 17,804,000; 13,853,000 had served in the Second World War.

To help the millions of Second World War veterans meet their readjustment problems with the benefits available to them by law, VA decentralized in 1945. In addition to the Central Office in Washington, D. C., 13 branch offices, each under a deputy administrator, were established to cover every part of the United States and its possessions. Under the jurisdiction of the branch offices (as of Sept. 1, 1946) were 327 field stations (regional and sub-regional offices, hospitals, homes, and centers) and 736 contact units. Included are VA offices in Puerto Rico Alaska, Hawaiian Islands, and Philippine Islands.

The number of full-time VA employees increased from 68,174 on Sept. 1, 1945, to 177,930 on Sept. 1, 1946. Of this latter figure, 152,783 were employed in branch offices and field offices. By comparison, there were 33,236 full-time employees on VA payrolls on June 30, 1937.

MEDICINE AND SURGERY ORGANIZATION

The urgent need for rapid expansion of all medical services for veterans, a result of the Second World War, prompted the reorganization and creation of a Department of Medicine and Surgery under a Chief Medical Director (Public Law 293, 79th Congress, Jan. 3, 1946). This law authorized the Administrator of Veterans Affairs to employ without regard to the civil service Classification Act of 1923, as amended, physicians, dentists, nurses and other professional and non-professional personnel at such pay rates as he prescribes. The bill also authorized the Administrator to establish residencies for physicians in VA hospitals and clinics.

In connection with the physician training program, almost 900 consultants and attending physicians and almost 600 residents and physicians in residency training had been appointed by June 30, 1946. Sites for new VA hospitals were being chosen near medical centers so that VA might realize the benefits of affiliation and close liaison with outstanding professional men in these centers.

There were 114 VA hospitals by Sept. 1, 1946, with 88,783 authorized standard beds, and nearly 13,000 beds allotted by other agencies, in addition to over 9,000 beds available for service-connected cases through contracts with state and civil hospitals.

MEDICAL SERVICES

As of Sept. 1, 1946, VA has the following medical services to aid veterans:

Neuropsychiatric Service.—Approximately 55 per cent of all hospitalized veterans are NP cases, for whom 33 hospitals now exist, with two under construction, 11 more to be built, and one to be acquired from the Navy. In addition, patients in general medical and surgical hospitals will be treated in mental convalescent centers or special treatment centers. Mental hygiene clinics are treating those not needing hospitalization, in an effort to practice preventative medicine.

Tuberculosis Service.—VA operates 14 tuberculosis hospitals and 40 tuberculosis departments in general and neuropsychiatric hospitals and treats some 8,800 patients. To insure early diagnosis and prompt treatment of tuberculosis among younger veterans, chest x-rays are taken of each hospitalized patient at the time of admission and each out-patient at the time of scheduled examination. Periodic surveys of all general and neuropsychiatric patients at the end of each 12 months' residence in hospitals have been authorized.

Surgery.—Surgical facilities are provided in all VA hospitals. These comprise a surgical operating suite and necessary trained personnel to operate it. They are available continuously, 24 hours a day, seven days a week. The surgical service includes general surgery, orthopedic surgery, urology, ophthalmology, otolaryngology, plastic surgery, thoracic surgery, neurosurgery, gynecology, radiology, and anesthesiology.

General Medicine.—There are 67 general medical and surgical hospitals. Treatment for medical conditions also is furnished in tuberculosis and neuropsychiatric hospitals. In addition, out-patient treatment for service-connected medical conditions, or conditions aggravating a service-connected condition, is being rendered in VA regional and sub-regional offices.

Prosthetic Service.—VA's program for prosthetic appliances has been organized to provide efficient service and maximum benefits to veterans requiring artificial aids. VA will buy the veteran any appliance he chooses, and a nationwide service system is being established so amputees may obtain immediate repair service, up to $35, with VA paying the bill.

Medical Rehabilitation Service.—As the medical and surgical care of patients is carried out, an intensive course in medical rehabilitation is being given to veterans. Disabled veterans must learn how to walk up and down steps; patients who wish to further their education can take part in a complete academic program; veterans can explore vocational possibilities for post-hospitalization work while still patients.

Out-Patient and Dental Service.—In order to render prompt and efficient service to eligible veterans in need of treatment on an out-patient basis, agreements or contracts had already been arranged with 21 statewide medical groups by the end of September, 1946. It is anticipated that an agreement, together with a fee schedule, will be worked out for each state. After the veteran has contacted the VA representative, and received approval, he may select his own doctor in his community, if the latter is a member of the medical association plan, and VA will pay for the treatment. VA also has contracts with mental hygiene clinics, out-patient departments of hospitals, general medical and surgical clinics for treating out-patients. These agreements supplement the work of VA's own fulltime clinics in operation in regional and sub-regional offices and the out-patient departments of its own hospitals.

Of the 346,036 veterans admitted to VA hospitals during the fiscal year 1946, 67.6 per cent were Second World War veterans, 28.9 per cent First World War veterans, and 3.5 per cent were veterans of other wars and men discharged or retired from all branches of the regular military service. General medical and surgical cases constituted 80.3 per cent of the total; pulmonary tuberculosis cases, 4.4 per cent; and neuropsychiatric, 15.3 per cent. Sixteen per cent of all admissions were for service-connected disabilities; that is, directly or presumptively incurred in or aggravated by military service.

VA HOMES

To be admitted to a VA home, a patient must have a condition essentially chronic in character, not susceptible of cure or decided improvement by hospital treatment, and must be incapacitated from earning a living for a prospective period. As of Sept. 1, 1946, there were 12 homes with a capacity of 15,428 authorized beds; at the beginning of the fiscal year 1937 there were 12 homes with 18,756 beds. The reduction can be accounted for by VA's greater need for hospital beds, which resulted in the conversion of some beds in homes to hospital purposes. Almost 12,000 veterans were receiving home care on Sept. 1, 1946. Admissions during the year totaled 14,056. Of this total, 2,445 were Second World War veterans, 10,395 served in the First World War, and 1,216 were other eligible veterans.

INSURANCE

National Service Life Insurance was authorized by the National Service Life Insurance Act of 1940 (Public Law 801, 76th Congress) for all members of the armed forces ordered to active duty for more than 30 days. It could be obtained in amounts of not less than $1,000 or more than $10,000 in multiples of $500. The passage of this law terminated the right of persons entering the armed forces after Oct. 8, 1940, to purchase U. S. Government Life Insurance unless they otherwise were eligible as veterans of the First World War.

National Service Life Insurance originally was issued on the Five-Year Level Premium Plan, which means that premiums paid at a fixed rate were for insurance protection alone; the policies do not have cash, loan, paid-up, or extended insurance values. This form provides the maximum amount of temporary protection at the lowest cost. The term period for all NSLI insurance issued prior to Jan. 1, 1946, was extended three years by Public Law 118, 79th Congress (July 2, 1946). Therefore, those policies may be continued in their original form for eight years from the date of issue. They need not be converted to a permanent plan before the expiration of that period. Policies issued after Dec. 31, 1945, must be converted within five years.

The Insurance Act of 1946 (Public Law 589, 79th Congress: Aug. 1, 1946) liberalized the provisions of the National Service Life Insurance Act of 1940, as amended, to meet the needs of veterans under peacetime conditions. Restrictions were removed from the choice of beneficiaries; three endowment plans were added to the ordinary life, 20-payment life and 30-payment life already authorized; provision was made for additional optional settlements; and protection against total disability for six months or more was made available in a separate policy provision for an extra premium and compliance with health requirements.

Below are three typical age groups and the premiums that must be paid for various types of policies:

Type of Policy	Monthly Premium per $1,000		
	Age 25	Age 30	Age 35
5-year level plan	$0.67	$0.71	$0.76
Ordinary life	1.37	1.56	1.80
30-payment life	1.67	1.83	2.03
20-payment life	2.12	2.31	2.53
Endowment at age 65	1.67	1.96	2.37
Endowment at age 60	1.89	2.27	2.82
20-year endowment	3.48	3.51	3.56

The Armed Forces Leave Act of 1946 (Public Law 704, 79th Congress; Aug. 9, 1946) authorizes VA to accept "terminal leave" bonds of former enlisted personnel, in lieu of cash, for the payment of premiums on all forms of Government Life Insurance.

VA's life insurance business is the largest mutual insurance system in the world. Within the last six years it has written more than 18,000,000 National Service Life Insurance policies having a total face value of nearly $150,000,000,000 (B). By Sept. 1, 1946, almost one-third of this still was in force, or an estimated 6,195,000 policies for $38,615,520,000. As a direct result of war casualties and other deaths of more than 369,000 insured veterans, monthly installments were being paid to beneficiaries on more than $3,400,000,000 of insurance awarded on death claims up to the end of August, 1946.

U. S. Government Life Insurance.—Originally known as War Risk Insurance in the days of the First World War, it was authorized by amendment to the War Risk Insurance Act (Public Law 90, 65th Congress: Oct. 6, 1917), to enable those who served in the First World War to purchase insurance from the Government in amounts of not less than $1,000 or more than $10,000, in multiples of $500. About 4,500,000 persons applied for this insurance between Oct. 6, 1917, and Nov. 11, 1918, for an amount of nearly $40,000,000,000 (B). Under provisions of the original act, conversion from term to permanent United States Government Life Insurance could not be made until after the close of the First World War. As of Sept. 1, 1946, there were in force 547,470 United States Government Life Insurance policies representing $2,373,366,156.

Civil Relief.—Article IV of the Soldiers' and Sailors' Civil Relief Act of 1940 (Public Law 861, 76th Congress), as amended by Public Law 732, 77th Congress, provided a method whereby the Government under certain conditions, upon application by the insured, guaranteed commercial life insurance policies against lapse for the non-payment of premiums while the insured was in active service and for two years after discharge under certain conditions. By Sept. 1, 1946, approved applications under this provision totaled 89,048 for an amount of $221,923,103.

EDUCATION AND TRAINING

Education and training for Second World War veterans is authorized by two laws: Public Law 16, 78th Congress (as amended by Public Laws 346, 78th Congress, and 268, 79th Congress) pertains to eligible disabled veterans with handicaps removable by training with the purpose of restoring employability. Title II of the Servicemen's Readjustment Act of 1944 (Public Law 346, 78th Congress), amended by Public Law 679, 79th Congress, pertains to eligible able-bodied veterans.

The two laws differ greatly, although both offer education and training at the expense of the Government, with tuition, supplies, and in many cases subsistence allowance provided. Public Law 16 gives VA a high degree of responsibility for the guidance and welfare of the disabled veteran, while Public Law 346 keeps VA's supervisory responsibility at a minimum.

Veterans with service-incurred or aggravated disabilities, who need training to restore employability, can enroll under Public Law 16. They must have extensive, scientific advisement and guidance by VA trained personnel in selecting their courses and throughout their training. While in training, and for two months after employability is determined, they receive a subsistence allowance of $65 a month if without dependents or $90 a month with dependents, in addition to their disability pensions. If pension plus allowance do not total $105, if a veteran is without dependents, or $115, if he has dependents, an additional sum is paid to make up the difference. The sum is increased further if there is more than one dependent. If a veteran is enrolled in on-the-job training, he retains whatever wages are paid to him, but if his salary plus subsistence allowance surpass the wage of a beginning trained journeyman, VA will cut his subsistence allowance proportionately.

Able-bodied veterans can choose their own course of study or job training under Public Law 346. The place where they enroll must have the approval of the appropriate state approving agency. The amount of training or education to which a veteran is entitled depends upon his length of active service and ranges up to 48 months. If he enrolls in an educational institution, VA will pay his tuition, fees, book and supply costs up to a $500-a-year maximum. If he takes a full-time course, he will receive a $65 a month subsistence allowance if he has no dependents, or $90 a month with dependents. If he takes on-the-job training, he retains whatever wages are paid to him, but if his salary plus subsistence allowance surpass the wage of a beginning trained journeyman, VA will cut his subsistence allowance proportionately. Whether he is earning wages on the job, or in an outside work while in school, his subsistence allowance also will be adjusted so that the total of the allowance plus his training wages does not exceed $175 a month if he has no dependents, or $200 a month if he has dependents.

By Sept. 1, 1946, 50,394 disabled veterans were in educational institutions under Public Law 16, and 54,647 were taking on-the-job training. At the same time, 672,668 veterans were in educational institutions under Public Law 346, and 471,313 were taking on-the-job training.

LOANS

Title III of Public Law 346, 78th Congress, amended by Public Law 268, 79th Congress, made provisions, within certain limitations, for the guarantee of loans or insurance of credit through private lending institutions to Second World War veterans who desired to purchase or construct homes, farms, and business property.

Amount of guarantee may not exceed 50 per cent of the loan, or a maximum of $4,000 on real estate and $2,000 on non-real estate loans. If a veteran receives loans of both types, the maximum guarantee is prorated on these amounts. Farm realty loans must be paid off within 40 years, other real estate loans within 25 years, and non-real estate loans within 10 years.

As of Sept. 1, 1946, 293,931 veterans received loans amounting to $1,429,331,142. VA guaranteed and insured $657,958,220 of this amount. Over 90 per cent of veterans—or 257,471—borrowed $1,316,533,848 to buy or build homes; 26,351 borrowed $78,919,887 for business purposes; and 10,109 borrowed $33,877,406 for farms and farm equipment. At the same time, 2,462 G. I. loans had been repaid in full, relieving VA of commitments amounting to $3,405,848. Only 210 veterans defaulted on their loans, costing VA but $181,254 in net claims paid to lending institutions. The bulk of defaults—173—were for business loans. Home loans accounted for 26 and farm loans for 11.

READJUSTMENT ALLOWANCES

The program of readjustment allowances, in operation under Title V, Public Law 346, 78th Congress, provides financial assistance for eligible veterans during periods of unemployment, or when self-employed and earning less than $100 per month. For the first 90 days of active service since Sept. 16, 1940, and prior to the end of the war, a veteran is entitled to 24 weeks of allowances; for each subsequent month during that period, to four additional weeks, up to a maximum of 52 weeks. The program is administered by State Unemployment Compensation Commissions under individual contracts with VA, which reimburses them both for the amounts they pay to veterans and administrative expenses.

During the week ended Sept. 1, 1946, 1,649,820 veterans were drawing readjustment allowances for unemployment. During that time, State Unemployment Compensation Offices paid out $31,863,150. For the month of August, 332,519 self-employed veterans drew $34,281,321 in readjustment allowances. About 85 per cent of the self-employed were farmers.

PENSIONS AND COMPENSATION

Laws enacted during the years 1937 and 1946 considerably increased the rates of pension and compensation, and liberalized the conditions of entitlement to permit benefits to additional classes of dependents. Death pensions and compensations can be paid to the widows, children, and dependent parents of veterans who served in the Mexican, Civil, and Indian Wars, Spanish-American War, Boxer Rebellion, Philippine Insurrection, and the First and Second World Wars, as well as to dependents of those who served during peacetime.

At the end of the fiscal year 1946 (June 30), 36 per cent of the death pension and compensation benefits paid by VA were based on Second World War service; 42 per cent were for First World War service; 3 per cent for peacetime service; and 19 per cent for service in the Spanish-American and prior wars. Disbursements for compensation and pension from July 1, 1945, to June 30, 1946, totaled $1,254,000,000 (B), of which $732,000,000 was for Second World War service; $346,000,000 for First World War service; $24,000,000 for service in the Regular Establishment; and $152,000,000 for service in the Spanish-American and previous wars. On June 30, 1946, compensation and pension at an average monthly rate of $59.33 were being paid to the dependents of 180.938 veterans of the Second World War.

GUARDIANSHIP

VA's guardianship load rose from 92,648 wards on Aug. 30, 1945, to 127,106 wards one year later. Of the 127,106 wards 84.739 were entitled to benefits because of service by veterans of the First World War and other wars; and 42,367 wards were entitled to benefits on account of service by veterans of the Second World War.

CONSTRUCTION, SUPPLY AND REAL ESTATE

The Assistant Administrator for Construction, Supply and Real Estate is charged with the construction and maintenance of all veterans' hospitals, attendants' quarters, etc., equipping and supplying these facilities, real estate activities, and other related responsibilities. Since VA will have about 20,000,000 potential applicants for hospital service, it has embarked upon the world's greatest hospital construction program, a program which is expected to cost nearly $1,000,000,000 and to provide about 89 new hospitals and a number of additions to existing hospitals, located near medical centers as far as possible. Construction Service probably will turn over most of the new hospital construction projects to the U. S. Army Corps of Engineers for supervision of design and construction. The Supply Service purchases millions of dollars worth of supplies and equipment annually for VA hospitals, homes, and offices. The Real Estate Service purchases all sites for new hospitals and homes, and procures all space required by VA for offices and storage.

CONTACT AND SERVICES

Contact representatives are located in populated areas throughout the United States, and insular and overseas possessions, to assist and advise veterans, their dependents and beneficiaries of their rights and benefits. Over 2,000,000 personal contacts were made with veterans and their beneficiaries during August, 1946, alone.

FINANCE

Under the jurisdiction of an Assistant Administrator for Finance are activities responsible for making and accounting for payments, benefits and otherwise, which VA estimates will total well over $4,000,000,000 in the fiscal year beginning July 1, 1946. Included are the functions involving the guaranty of loans and the payment of allowances to veterans during unemployment.

BOARD OF VETERANS' APPEAL

It is the function of this Board to render final decisions on all cases appealed to the Administrator of Veterans' Affairs, wherein the claimant has been denied entitlement to a benefit for which he has made claim.

SOLICITOR

The responsibility of the Solicitor is the interpretation or construction of the several thousand statutes for the administration of VA. VA's Guardianship Service falls under the jurisdiction of this office.

NAVAL CONSTRUCTION AND EQUIPMENT

By John C. Niedermair
Bureau of Ships, Navy Department

PRESENT AND FUTURE STATUS OF SUBMARINES

Much of the research and speculation concerning the nature of navies of the atomic age is focused today on the submarine and its chances of promotion to "capital ship" rank as the aircraft carrier was in the Second World War. With some of its traditional weaknesses overcome and bolstered by the development of revolutionary weapons and means of propulsion, the sub-surface fighting craft has a spotlighted position in new military concepts being shaped in the light of atomic energy and the magic of electronics.

In immediate prospect is emergence of the "true" submarine, a craft capable of almost continuous submerged operation at high rates of speed. Such a submarine was blueprinted by the Germans before their surrender in 1945 after it became apparent that the older types—essentially submersible torpedo boats which dived only in emergencies—had been stripped of their effectiveness by Allied sea-air power buttressed by improved weapons and far-ranging electronic detection devices.

U. S. Navy designers, engineers and scientists are studying German developments, with an eye to strengthening the submarine's orthodox role of raider and scout. At the same time, Navy officers are considering the possibility of radical changes in the functions of the submarine. Launchers of rockets and guided missiles or carriers of aircraft operating with relative immunity under the surface of the sea may be the warships of the future. The use of atomic-energy propulsion for submarines is also envisioned.

THE PATTERN OF MODERN NAVAL OPERATIONS

Discussing the pattern of modern naval operations, Vice Admiral Arthur W. Radford, USN, DCNO (Air), declared:

"It is true that the specific weapons utilized by a navy change from time to time. We once used armed boarding-parties . . . We no longer depend on the high-caliber guns of battleships to hit enemy vessels at close range, when we can send the mobile and far reaching ordnance of carrier airplanes against any target that threatens our control of the seas. In the future we may turn to the submarine as our primary naval weapon.

"Who knows but that the strides we have made in antiaircraft defense—split-second fire control, proximity fuses, long-range, early-warning radar, guided missiles, and so on—may some day reach a stage of development where they render the piloted military aircraft obsolete?

"If this day comes, our undersea experts foresee a dependence on long-range submarines, capable of submergence for months, whose ability to fire rockets and guided missiles without surfacing will allow them to stand off any coastal target in the world and destroy it."

Similar ideas were expressed by Rear Admiral Harold G. Bowen, chief of the Navy's Office of Research and Inventions, who cited "a growing school of thought which visualizes the submarine as one of our most promising naval craft, if the time comes when atomic warfare forces us beneath the surfaces of the sea."

Rear Admiral Charles W. Styer, USN, ACNO (Operations), recently asserted that "submarines are certain to play an increasingly important part in our concept of national defense. Offensively, defensively and mechanically the submarine seems well adapted to a leading role in the navy of the future."

SUBMARINE TRENDS

Two coincidental trends are influencing the future of the submarine, 322 years after its debut as an underwater rowboat in the Thames River of Great Britain; (1) recognition of the growing need of a navy capable of extensive sub-surface operation, and (2) development of a craft meeting the requirements of extensive sub-surface operation.

During the half-century of its modern development the submarine became one of the most effective instruments navies have had in utilizing the ancient military devices of stealth and deception. Submarines were the only combat craft which could hide beneath the surface of the ocean, before, after, and even during an attack. Underwater operation, however, entailed sacrifices. When a submarine submerged, its speed was reduced to a maximum under 10 knots, its cruising range extremely limited. For underwater propulsion it had to rely upon electricity from batteries—a low-speed method making it impossible to leave an attack area in a hurry unless it came to the surface, in which case it was subject to heavy assault from surface vessels. Its underwater vulnerability likewise resulted from sonar and sonobuoys, the underwater sound detecting devices developed to a high state of efficiency in the recent war.

It was necessary for the submarine to spend considerable time on the surface, to charge batteries or to attain the speed—available only on the surface—required to reach target sectors. Radar and aircraft made even this kind of operation extremely hazardous. These handicaps the Germans sought to overcome in the final months of the Second World War by designing a submarine which seldom had to surface, and could travel submerged for long periods of time with an emergency speed of 24 knots in reserve. They claimed these qualities for their Type 26 U-Boat, the first "true" submarine. When the European war ended, the Germans had designed the model and partially constructed a hull.

Type 26 was to have three power systems—batteries for slow underwater operation, a Diesel engine for cruising at periscope depth and a revolutionary Walter hydrogen-peroxide engine for high emergency speeds. The latter type of engine and the schnorchel, the breathing tube which permitted operation of Diesels while cruising submerged, were the Germans' answers to the need of a highspeed method of submerged propulsion which would not exhaust the precious oxygen supply of a submarine.

The Walter engine, developed originally in pre-war years by a German engineer whose name it bears, contains its own oxygen supply. Hydrogen-peroxide is broken down in a chamber into water (in the form of steam) and oxygen, which are then fed into a combustion chamber along with fuel oil. From the combustion chamber steam pressure is directed onto turbines driving the shaft.

The engine was believed powerful enough to provide speeds up to 24 knots submerged, but it had defects. It would have been possible to maintain the maximum rate for only six hours, and after that period the Walter engine could not be used again until the submarine returned to base for more fuel. The cost of operation would have been almost prohibitive. At the prevailing rate of costs in the United States, the expense of a 6-hour run at 24 knots would exceed $100,000.

Navy engineers now are studying a Walter engine, which was removed from a German type 17 U-boat. This model, a forerunner of the Type 26, actually put to sea and reached a top submerged speed of 24 knots, but Type 17 was small, carrying only two torpedoes. The Walter engine built for the Type 26 hull is now in Britain.

ATOMIC ENERGY IN PROPULSION

More significant than the Walter engine in the future of the submarine are the possibilities of atomic energy. The prospect of this revolution in propulsion was pointed up by Admiral Styer when he said:

"The development of compact, efficient atomic energy plants in our submarines would give the undersea craft high speed while submerged and almost unlimited cruising range With this atomic firebox, none of a vessel's oxygen supply would be used up by the propulsion machinery, and the problem of expelling exhaust gases would be eliminated. Add to this an armament of rockets or guided missiles with atomic warheads, and you have a strong, offensive weapon that is itself relatively secure against atom bombs and detection by radar."

Admiral Radford listed atomic energy as one of the "three potentials" giving submarines "a great military future." He said:

"When submerged they cannot be detected at a distance because sea water still repels electronic waves. When submerged they are relatively immune to bombing attacks. Because of their compartmentation, and the protection against radiation afforded by surrounding water, they may well be the first craft in which atomic propulsion can be efficiently employed."

Navy submariners and anti-submarine warfare experts have been making test runs and experimenting with two Type 21 German U-boats, one being based at Key West, Fla. and the other at Portsmouth, N. H. One hundred and twenty of these were built but none was used by the Nazis in a war operation.

Although designed for installation of the hydrogen-peroxide engine, the Type 21 boats actually are powered with extra-large batteries, and diesels, and are equipped with the schnorchel. Their submerged speed is 15 to 16.43 knots. Here are some comparisons of the Type 26 and Type 21 U-boats:

	Type 26	Type 21
Surface Displacement	900	1600
Torpedo Capacity	10	20
Crew	32	57
Designed Maximum Submergence Depth	400 ft.	360 ft.

These types, and the schnorchel device which appeared in 1944 when the Nazi U-boat fleet went "underground" to dodge the Allied antisubmarine forces, are under the close scrutiny of Navy's submarine men.

SUBMARINES AS AIRCRAFT CARRIERS

The submarine's future as an aircraft carrier is problematical. Most naval powers have experimented with such models in the past, but because of their great weight and dangerously slow diving time they were not a success. In the Second World War, the Free French used one which carried one plane in a hangar on deck and two 8-inch guns, but it was lost in 1942.

The Japanese, who were behind the Germans in submarine design and used the undersea craft mainly for fleet operations, built some plane-carrying submarines during the war. The I-400 class, of which three were constructed, were the largest submarines yet designed, displacing 4,663 tons on the surface. They carried three bombing planes, and had speeds of about 20 knots surfaced and seven knots submerged.

SUBMARINE ARMAMENT

In addition to the prospect of rockets, atomic projectiles, and other guided missiles as armament for submarines, the traditional undersea weapon—the torpedo—is due for further refinement. Discussing the German acoustic torpedo, which homed onto the noise of ship's propellers, Admiral Bowen declared:

"We not only have similar ones, but have gone even farther. Roughly, we can get 40 knots with a steam torpedo, and up to 60 knots with refinement of hydrogen-peroxide drive developed by the Germans. But there is a probable limit of 75 knots on propeller-driven torpedoes."

HISTORICAL DEVELOPMENT OF THE SUBMARINE

Behind the submarine of today and its potentialities for the future lie more than 300 years of development. Before man actually attempted to sail beneath the sea, he imagined the feat.

A Greek tale of 300 B.C. detailed attempts of an imaginary enemy to equip men with diving gear enabling them to approach anchored ships and chop holes in the hulls. Leonardo da Vinci's notebooks show that he had conceived of the submarine, along with the flying machine in the 15th century. Jules Verne was fanciful about submarines, but by the time he published *Twenty Thousand Leagues Under the Sea* in 1870, he had had some working models on which to base his fancy.

The English considered trying submersibles to help stave off the Spanish Armada, but nothing came of it until numerous undersea boats were patented in the early 17th century. In 1624, Cornelius Van Drebbel, a Dutch engineer, constructed a submarine under the protection and influence of the Royal Navy. With Drebbel rowing and King James I as passenger, the boat made a 2-mile trip across the Thames in two hours, at a depth of 15 feet. The early submersibles were not taken seriously as fighting ships because there was no feasible armament. David Bushness, a lieutenant-captain of sappers and miners in the Continental army of the American Revolution, was probably the first man to use a submarine in war. With his boat he attempted to sink a British warship in New York harbor in 1775. His plan of attack: Submerge under cover of darkness (by taking on water ballast and thrusting downward with a vertical screw), approach the ship, bore a hole in its hull, attach a time bomb and retreat. There was one thing wrong —copper sheathing made it impossible to penetrate the hull.

Robert Fulton tried his hand at submarines before turning to the steamboat, but failed to interest Napoleon, the British, or the United States. There was still no practical armament.

In the American Civil War, the Confederate forces sought to compensate for their lack of a surface navy by constructing submarines to break the blockade. The attack was simple, although it had earmarks of a suicide mission. A contact mine was attached to a long spar projecting from the bow of the submarine. The crew was to make a submerged approach, ram the target and blow it up by explosion of the mine.

The Federal ship *Housatonic* was sunk by this method in 1864 in Charleston harbor, but the submarine was destroyed and most of the crew perished. The attacker, the Confederate submarine *Hundley,* thus became the first vessel built as a submarine to sink an enemy ship in action, although actually it was surfaced at the time.

The experience of the *Hundley* emphasized the problem of suitable armament for the submarine. In the 1870s, Robert Whitehead in Austria developed a self-propelling torpedo powered by compressed air. Surface torpedo boats at first were used to carry the new weapon, but the need was soon seen for a submersible torpedo carrier.

Late in the century the leading nations began adding submersibles to their fleets. A boat designed by John P. Holland, 100-ton, 50-foot submersible, was commissioned as the first U. S. Navy submarine in 1896.

The early submarines were propelled electrically submerged, and by steam or gasoline engines on the surface, but it was not until the adaptation of diesel engines in 1900-1910, and development of the periscope and gyro compass that the submarine began to show promise of becoming a long-range, quick-diving, elusive weapon.

In the early months of the First World War, the submarine was not highly regarded. It was small and frail compared with other ships, its primary function being reconnaissance and patrol.

An awakening came, however, in a chance encounter. The German boat U-9 on a scouting mission sank a British cruiser in the North Sea, and then stood by to destroy two more coming to the scene to pick up survivors. The submarine's record as a deadly weapon of war dated from that incident.

HALT IN SHIPBUILDING

Construction work on 37 ships, consisting of 30 combatant ships, six auxiliary vessels, and one landing ship, was stopped in January, 1946. This action was taken after the Navy Department, in conjunction with the Office of War Mobilization and Reconversion and the Bureau of the Budget, made a study to determine what Navy budget reductions might be included in the funds cutback bill to be introduced in Congress. Future naval vessel requirements were restudied and were reduced in every case where the cost of early completion of the vessels could not be justified. It is estimated the Government will save approximately $140,000,000 by the cancellation order after termination costs have been paid.

President Truman proposed Congressional repeal of $2,826,880,536 in appropriations and contract authorizations for the Navy. Of this amount, $1,677,260,536 is mainly the result of cutbacks in procurement and shipbuilding, and $1,149,620,000 represents appropriations not needed in the fiscal year of 1946, but which will have to be restored in future years to liquidate contract authorizations. The President also proposed cuts of $1,420,576,472 for the Army and of $1,503,971,475 for the civil agencies.

An earlier reduction in the shipbuilding program was accomplished in 1945 when 56 combatant ships, 39 auxiliary vessels, and 160 district craft and auxiliaries were canceled, resulting in a total estimated net savings of approximately $1,200,000,000.

Types and number of vessels affected by the January order were: Light aircraft carrier, 1; escort carriers, 2; heavy cruiser, 1; light cruiser, 1; destroyers, 13; destroyer escorts, 4; submarines, 8; destroyer tenders, 3; barracks ships, 2; salvage vessel, 1; LST, 1. Fifteen ships which had reached a comparatively advanced stage of construction were not declared surplus but would be accepted by the Government and reserved in a laid-up status for possible future completion, either as originally intended or for experimental purposes: the CVL, 2 CVEs, the CL, 3 DDs, 3 SSs, 2 ADs, 2 APLs and the ARS.

SEA POWER THE NATION'S FIRST LINE OF DEFENSE

In this age of atomic bombs and other revolutionary weapons, the Navy is still the nation's first line of defense. Secretary of the Navy James Forrestal and Fleet Admiral Chester W. Nimitz made this point before the Senate Naval Affairs Committee in a frank appraisal of the Navy's future role. Squarely facing the issue by bringing up the subject themselves, they made two major points:

Far-flung naval forces and bases offer the best defense against an atomic warfare assault on the United States.

Until the day wars are waged without transportation of men or materials, or when such transportation can be accomplished solely by air—and neither of these events lies within the realm of "reasonable expectations"—the Navy will be needed.

In the meantime, for a "transition period" covering "the next few years" —years in which a reasonable prospect of enduring peace will be the goal rather than an accomplished fact—it would be an unwise gamble to maintain anything less than the 500,000-man Navy envisaged in the Navy's post-war program, the Senators were told.

In the process of informing the committee of what the best professional opinion considers to be the minimum naval force requirements in the light of immediately existing world conditions, the Secretary, the Chief of Naval Operations, and four other high-ranking representatives of the Navy's top command presented a detailed picture of the proposed postwar Navy. Major subjects discussed included bases, ships, submarines, and aviation.

BASES

The Navy plans to maintain 53 advanced bases—33 in the Pacific and 20 in the Atlantic. In the Pacific, the essentials are the main naval base at

Pearl Harbor, a major operating base in the Guam-Saipan area, secondary bases in the Ryukyus and the Philippines, and the use of Manus when required, Vice Admiral Forrest P. Sherman DCNO (Operations) told the committee. Plans cover bases at Samoa, Midway, and at Adak, Kodiak, Dutch Harbor, and Attu in the Aleutians, with a submarine base at Balboa at the Pacific end of the Panama Canal.

In the Atlantic-Caribbean areas, the main operating base would be at Roosevelt Roads in the Puerto Rico area, with secondary operating bases at Guantanamo, Trinidad, San Juan, Coco Solo, Bermuda, and Argentia in Newfoundland, and a submarine base at St. Thomas, Virgin Islands. A minimum number of the bases in the Atlantic and Pacific will be fully operational, some in a reduced operational status, some in a maintenance category, and others in a caretaker status. Air bases and air strips will be maintained at strategic points.

SHIPS

The Navy plans to maintain 70 to 80 per cent of the wartime complements aboard the 319 major combatant ships allocated to the post-war Active Fleet. The 73 major combatant ships of the Ready Reserve will have 20 to 30 per cent of their normal wartime complements, and any one ship of this fleet could join the Active Fleet one to three months after receipt of personnel. The Inactive Fleet of 651 ships would require about nine months for total reactivation, but any one ship could be put in the Active Reserve Fleets in about three months.

The United States entered the war with seven aircraft carriers. The post-war Navy will have 13 active, five in reserve, and 19 inactive. At the start of the war, there was one escort carrier—a prototype. Eighty were used during the war, and the post-war plan is to have 13 active and 66 inactive. The battleship force grew from 17 to 24 during the war, and post-war there will be four active, six in reserve, and eight inactive. Cruisers went from 37 to 93; 28 will be active, 18 in reserve, and 36 inactive. Destroyers increased from 172 to 445; 135 will be active, 40 in reserve, and 191 inactive. Destroyer escorts increased from none to 363; 36 will be active, four in reserve, 258 inactive.

SUBMARINES

The United States entered the war with 112 submarines, and built up to 259, plans to have 90 active, and 109 inactive in the post-war Fleet. Admiral Nimitz, discussing the significance of developments in atomic warfare, declared at one point the submarine "may become the most successful vehicle for carrying atomic weapons to within short distances of coastal targets and for ensuring accuracy in the use of guided missiles."

"The submarine," Admiral Nimitz said, "may be expected to have continued and increased employment in the future. At sea it is relatively immune to atomic bombing and also to radar detection."

AVIATION

Vice Admiral A. W. Radford, DCNO (Air) told the Senate Naval Affairs Committee that carrier aircraft would total 2,180 planes, with 114 others allocated to cruisers and battleships. Fleet air wings will have 471 planes, 297 of them patrol land planes and 174 seaplanes and amphibians. Marine aviation will include 240 escort carrier aircraft and 726 support aircraft.

Plans also call for 181 target aircraft, 117 transports, one squadron of eight blimps with four in reserve, 1,350 primary and intermediate trainers, 1,200 type and operational trainers, 400 special technical trainers and utility aircraft, 450 experimental aircraft, 450 for air base utility, administration and service training, 126 for Marine utility purposes, and 4,002 planes in reserve.

SHIPS OF THE FUTURE

Lessons of war and a glimpse of things to come became evident as the Navy wound up its vast wartime shipbuilding program and started into the transition building phase which someday will produce the Navy of the future.

Many nearly completed combatant craft will be joining the Fleet soon, some of them nearly exact prototypes of wartime ships, a few of them with such innovations as radically new ordnance gear that would have been the dream of any gunnery officer who beat off *kamikazes* in the western Pacific. Two hulls—*USS Kentucky* (BB66) and *USS Hawaii* (CB3), as has already been announced, are being delayed pending design changes which will make them the world's first major warships equipped to launch guided missiles.

CRUISER CONSTRUCTION

Most interesting of the ships under construction—with the exception of *Kentucky* and *Hawaii,* whose completion is still distant, are five new cruisers, two lights and three heavies. They are *USS Worcester* and *Roanoke,* CLs 144 and 145 respectively. and *USS Des Moines, Salem,* and *Newport News,* CAs 134, 139 and 148, in that order.

The *Worcesters* are a new light cruiser class, and they reflect wartime experience from keel to truck. They're the first really new light cruisers since the *Clevelands,* although some of the later members of that class were modified to single-stack jobs. Little has been released on the *Worcesters* beyond the fact that they will displace 14,700 tons, against the *Cleveland's* rated 10,000-ton displacement. The new light cruisers thus follow a general trend in naval architecture toward ever bigger, heavier ships.

The big modification in the *Worcester* and the *Roanoke,* however, will be the batteries. The ships will carry 12 6-inch dual purpose rapid-firing guns in twin turrets—three turrets forward and three aft. They will have no 5-inch AA battery, but will depend upon an array of smaller AA weapons for close-in work against such planes as the 6-inchers may have failed to keep at a respectful distance.

The new *Des Moines* heavy class is just as big a departure in that type. Following the trend, they are huge 17,000 tonners, compared to the 13,600 tons of the previous *Baltimore* class.

The *Salem* and *Newport News* of this class were chosen by the Navy for experiments in air conditioning.

The *Des Moines, Salem,* and *Newport News* will carry a new rapid-firing 8-inch gun—nine of them in three turrets.

The new 6-inch batteries on the *Worcesters* and the 8-inch on the *Des Moines* are automatic from ammunition handling rooms to the gun muzzles, including ejection of the cartridge cases from the mounts. Powder bags have been abandoned in favor of cases, to achieve the desired rapid firing rate. For the first time in the U. S. Navy, and very probably in all navies, no ammunition handlers will be required in the turrets of 6- and 8-inch batteries. The design represents ammunition-handling features that were independently developed in a number of mounts, both U. S. and foreign.

Rapid rates of fire in both 6- and 8-inch mounts were made possible by extensive mechanization requiring a much greater use of electric and hydraulic control, servo and power systems than has been employed in any ordnance heretofore. To insure satisfactory performance of the great amount of specialized equipment, pilot models have been tested through 100,000 cycles, testing exceeding that to which any previous ordnance gear was subjected.

The 8-inch mount features for each gun a control and trouble-indicator panel which shows immediately the position of the ammunition in the entire loading system from magazine to breech, and the exact location of any type of electrical failure in the system. Advantage of this at-a-glance trouble-shooting is obvious. These features are present, in a modified form, in the 6-inch mount.

Because of the increasingly automatic nature of the new guns, interference eliminators have been provided to prevent adjacent mounts from "locking horns" while under individual control and following different targets.

Of the 6-inch it may be said they are the first rapid-fire AA mounts of such large calibers. Rate of fire has exceeded original design specifications by about two-to-one.

Both the 6- and 8-inch mounts have automatic fuse-setting while the projectile is in the slide, guaranteeing a uniform, minimum dead time for fuses. They may be set a spit second before shells are rammed into the breech.

TREND TOWARD HEAVIER SHIPS

The *Worcesters* and the *Des Moines,* as indicated, illustrate well the tendency to build bigger and heavier ships within each type. The constant demand for greater firepower, greater range, greater speed in each type is the cause of this phenomenon. It was exaggerated as a result of the treaties of the '20s, which imposed tonnage limits. When the treaties were finally abrogated, the immediate increase in size of naval units was startling.

Some examples, all displacements standard, are:

USS Arkansas (BB33), commissioned 1912, 26,100 tons; *USS Kentucky* (BB66), building, 45,000 tons. *USS Ranger* (CV4), commissioned 1934, 14,500; *USS Midway* (CVB41), commissioned 1945, 45,000 tons (*Lexington* and *Saratoga,* older than *Ranger,* omitted as not having been built from the keels up as carriers). *USS Salt Lake City* (CA25), commissioned 1929, first of the treaty cruisers, 9,100 tons; *USS Des Moines* (CA134), building 17,000 tons. *USS Omaha* (CL4), commissioned 1923, 7,050 tons; *USS Worcester* (CL144), building, 14,700 tons.

An interesting corollary of this search for more characteristics per hull, and consequently for ever bigger, ever better warships, is the development of new types as old types get too big for their jobs. As DDs increased in size from the 920-ton *Allens* to the 2,400-ton *Gearings* (the smallest and largest types which saw Second World War service), something was needed to fill a gap. Big destroyers, almost small cruisers, took a long time to build, cost large sums of money and required large numbers of trained personnel. The DE was born, lighter, cheaper, quicker to build, and actually better suited for many types of convoy work than the new destroyers. In like manner, the CVE was more or less a result of the tremendous growth of the CV, and the CLAAs of the late war were cut in under the CL program to do jobs too big for DDs but too small for the expensive CL.

Aside from the *Worcesters* and the *Des Moines,* ships building now, the most of which will be ready for the Fleet within the near future, and a few of which were recently completed, represent "end of the program" construction—the last war types, some of them slightly modified.

Incidentally, the Navy found it advisable to complete some (but not all) of the wartime building programs, because the earlier ships of the same types were hard-used in the war. Many of the first *Essexes* and *Clevelands,* for example, though not old in years, are old in service. Three or four years of war service seems about equivalent to 12-15 years of normal service. Maintenance and operating costs of the older wartime ships are consequently higher than those of the "end of the program" ships.

CARRIERS

Among the carriers are *USS Oriskany* (CV34) and *Valley Forge* (CV45), last of the *Essexes* building; *USS Saipan* and *USS Wright,* CVLs 48 and 49, two ships of a new class displacing 14,500 tons against the 11,000 tons of the previous *Independence* class (the *Saipans* are on a modified *Baltimore* hull, *Independences* are on *Cleveland* hulls), and *USS Coral Sea* (CVB43), end of the supercarrier program. The CVE program ended with completion of the last of the *Commencement Bay* class carriers *Rabaul, Palau* and *Tinian,* numbers 121-123.

The *Commencement Bays,* a new design based on the earlier four-ship *Sangamon,* or tanker-type, class, were the most successful CVE type and, in fact, the only CVEs which are in truth "warships." The *Commencement Bays* were designed as CVEs from the beginning, whereas all other CVEs were basically merchant designs. The improved design is particularly apparent in the vastly improved compartmentation of the *Commencement Bay* class. The Navy favored the *Commencement Bays* in selecting the CVEs it would retain on active service in the post-war years. Most of the other CVE classes were assigned to the Inactive Fleets, scrapped or sold as hulls.

A few cruisers complete the list of major warships building. *USS Toledo* (CA133) represents the end of the *Baltimore* program; *USS Albany* and *Rochester,* CAs 123 and 124, the last of three single-stack *Baltimores, USS Manchester* (CL83) will conclude the *Cleveland* program; *USS Fargo* and *Huntington,* CLs 106 and 107, two single-stack *Clevelands,* have joined the fleet.

GUIDED MISSILES

"The United States, racing to maintain its naval supremacy, is already building the world's first atomic-age capital ships armed with main batteries of robot rockets instead of guns."

This statement of the Associated Press sums up the story of the *Kentucky* and the *Hawaii.* Both hulls, *Kentucky* 70 per cent complete at Norfolk Naval Shipyard and *Hawaii* 85 per cent complete at New York Shipbuilding Corp., Camden, N. J., have been delayed pending major design changes which will equip them to launch guided missiles.

Obviously, the revolution is at hand. Admiral Cochrane stated when the *Kentucky-Hawaii* announcement was made: "The Navy's experiments with guided missiles have always contemplated eventual shipboard installation, although design studies were handicapped until the Navy had made more progress in the development of guided missiles. The design studies now being made for the *Kentucky* and *Hawaii,* together with the development of missiles guided by carrier-based aircraft, will lead to a revolution in the striking power of naval warships."

The Associated Press commented further: "It was patent, however, that the announcement marked the end of an era—the age of the rifled gun in the main batteries of American naval ships."

That age had seen naval architecture advanced from the steam frigate during the last half of the 19th century to mammoth 45,000-ton *Iowas* of the Second World War, the greatest engines of destruction afloat. Even the *Iowas* would not have been the zenith of the rifled gun era, had the United States gone ahead with its wartime plans and built the five ships of the *Montana* class ordered in 1940 but canceled in 1943. Monsters of 58,000 tons these were to be, mounting main batteries of 12 16-inch 50-caliber guns, three in each of four turrets; 903 feet in overall length with beams of 120 feet. These behemoths were to be named *Montana, Ohio, Maine, New Hampshire* and *Louisiana,* BBs 67-71, but, they were canceled, and perhaps it was well they were. Because the developments of this fantastic age have brought a weapon of even greater potential power than the battering, crushing 16-inch shell with its mere 20-odd mile range. The soaring rocket of who-knows-what maximum range has burned a blazing trail across the naval horizon.

Still in the top secret drawer are particulars on the *Kentucky* and the *Hawaii,* if indeed they have been decided. Vast problems must be met and overcome in adapting the huge vessels as rocket platforms, and providing the fire control systems necessary to launch missiles which may have undreamed-of ranges.

Discussing the experiments on the *Kentucky* and the *Hawaii,* Vice Admiral Forrest P. Sherman, USN, DCNO (Operations), commented that, if the designs work out, the

Navy may convert the earlier battle cruisers, *USS Guam* and *Alaska,* to guided missiles warcraft.

ATOMIC POWER FOR WARSHIPS

The age of the atom will have other effects on the surface Navy, chief among which may be the development of atomic power plants. Admiral Cochrane, in this connection, has predicted that the Navy will be successful in developing atomic-powered warships. The Admiral declared that atomic power for warships is a practical possibility, and that the Office of Naval Research is working on the theory considerations. The Navy, in conjunction with the Army's Manhattan District, is studying a solution of the engineering problems involved.

Admiral Cochrane's prediction is backed up by a statement of Dr. W. A. Higinbotham, chairman of the Federation of American Scientists, that, in two years, atomic fuels may be producing electric power at Oak Ridge, Tenn., and in five years atomic power may be propelling ships.

From that point on, any smart guess is apt to be a good one. It is obvious, for instance, that great changes may occur in space-weight factors aboard ship when the scientists have harnessed the atom for main propulsion machinery. Machinery and fuel account for 25-30 per cent of the space-weight in a modern BB, but these changes would not come all at once, nor would they all result in a saving of weight by any means. Some space-weight probably will have to be used to protect the crew from radioactivity. In the early stages of atomic propulsion development, it seems likely that a conventional heat transfer system will be used—boilers, turbines, etc., to convert atomic heat into shaft revolutions. "Direct drive" atomic power (jet-propelled battleship?) may be a much later development, but might easily save considerable weight on propulsion machinery.

It is a question whether such a saving in weight would reverse the trend towards bigger ships. More likely CNO, BuAer, BuOrd and BuShips would seize upon the weight advantage to pack more fighting characteristics into the hull. Perhaps more guns, more planes, more personnel anti-atomic armor—and, the naval architect is about back where he started.

These are, of course, matters of speculation and of present concern to ship designers, and they probably are far afield of the immediate interest Navy men have always held for the ship at hand. About the only conclusion that can be drawn, inherent in the preceding paragraphs, is that whether one is talking of the age of the Dahlgren gun or the age of the guided missile, the same determining factors keep cropping up in naval architecture; the balance between range and speed and firepower and armor, which naval architects always must consider as they seek the perfect warship.

WATERWAYS AND HARBORS

By Raymond A. Wheeler

Lieutenant General, U. S. A.; Chief of Engineers, War Department

RIVER AND HARBOR IMPROVEMENTS

Federal improvement and maintenance of rivers and harbors and other waterway channels of the United States and its territories and island possessions have been prosecuted for some 120 years under the direction of the Secretary of War and supervision of the Chief of Engineers, U. S. Army, in accordance with the authorizations of Congress.

During the first part of the fiscal year ended June 30, 1946, the river and harbor program continued in conformity with the national policy limiting wartime construction to conserve manpower, equipment, and materials. With the cessation of hostilities, however, work was commenced on a number of projects which had been deferred during the war. Improvement operations were carried out on 32 regular river and harbor projects of which one, Morro Bay, California, was completed. Maintenance operations were performed on 224 projects including the numerous coastal and inland harbors, connecting channels on the Great Lakes, and the extensive Intracoastal Waterway and Mississippi River network, together with the operation and care of the canalized Ohio River system, Illinois Waterway, and upper Mississippi River. The Federal expenditures for new work and maintenance operations on navigation projects and allied operations during the fiscal year ended June 30, 1946, were $79,542,449.85.

The principal items of new work performed during the fiscal year 1946, other than on canals and inland waterways, included enlargement of channel facilities of New York and New Jersey channels in Arthur Kill and from the vicinity of Bayside-Gedney Channel to Perth Amboy to provide for the larger tankers; and completion of dredging and rock removal in the main channel in Newark Bay from Kill Van Kull to about 1,200 feet south of the Central Railroad of New Jersey Bridge including the cut-offs at the entrance.

The improvement of Port Aransas-Corpus Christi Waterway was continued by dredging the Corpus Christi turning basin, Industrial Canal and Avery Point turning basin, and dredging was in progress at the end of the year in the channel leading to Corpus Christi turning basin.

Dredging of a seaplane base in San Diego Harbor to the extent desired by the Navy Department and of a settling basin at the mouth of the Los Angeles River diversion channel at Los Angeles and Long Beach harbors, California, was completed. At Morro Bay, California, the extension to the Morro Rock Breakwater was completed and dredging was performed in the main channel and the channel into the lower bay.

At Fort Peck Dam, Montana, on the Missouri River, alterations to the penstock, installation of a wyebranch structure and shaft No. 1 transition section, and installation of 15,000-kilowatt generating unit were continued in addition to other miscellaneous features. Operation of the previously installed 35,000-kilowatt generating unit was continued during the major portion of the year, the total power production being 102,506,000 kilowatt-hours. The reservoir was also operated in conjunction with maintenance dredging to maintain a channel suitable for navigation on the lower reach of the Missouri River. At the Bonneville Dam, Oregon and Washington, one spare 60,000-KVA transformer was installed and other equipment procured; ten power generation units were operated, producing 3,039,841,000 kilowatt-hours during the calendar year 1945.

In addition to the new work mentioned, maintenance operations were performed at important river and harbor and other waterway projects previously completed along the Atlantic, Gulf, and Pacific coasts, in the interior, and on the Great Lakes.

INTRACOASTAL WATERWAYS

The Atlantic and the Gulf Intracoastal Waterways provide a protected channel for barge and other light-draft navigation following coastal sounds, bays, rivers, and artificial channels. This canal system, extending for more than 2,300 miles along the Atlantic and Gulf coasts, affords a channel 12 feet or more in depth throughout the Atlantic coast section from Trenton, N. J., to Jacksonville, Fla., and in the Gulf coast section from Carrabelle, Fla., to Corpus Christi, Tex. During the past year new work dredging was performed in the Gulf Intracoastal Waterway in Texas between Corpus Christi Bay and North Bird Island and between Port Isabel and Three Islands.

The Cape Cod Canal, Massachusetts, extending from the head of Buzzards Bay to Cape Cod Bay, and the Chesapeake and Delaware Canal between the Delaware River and Chesapeake Bay, are sea level waterways, affording a protected and shorter route for coastwise ocean-going vessel traffic, and were maintained and operated as required.

INLAND WATERWAYS

The principal inland navigable waterways of the United States include the Mississippi River system, Illinois Waterway, New York State Barge Canal system, San Joaquin-Sacramento River system in California and Columbia River system in the northwest. The Mississippi River Waterway system embraces the river proper, the Red, Arkansas, Missouri, Illinois, Ohio, Tennessee, Monongahela, Allegheny, and Kanawha rivers and other streams. The Mississippi River has a channel for ocean-going vessels to Baton Rouge, La., and thence a channel for modern barge navigation to Minneapolis, Minn., and in its principal tributaries. The Illinois River and Waterway to Lake Michigan has a barge channel which connects the Great Lakes with the Mississippi River system. The Mississippi River Waterway system, together with the Intracoastal system which it connects at Plaquemine and New Orleans, La., brings barge navigation within reach of important industrial and farming centers.

The San Joaquin-Sacramento River system, with an outlet to the sea through San Francisco Bay, has a deep-draft channel to Stockton, Calif., on the San Joaquin River, and a moderate-draft channel to Sacramento, on the Sacramento River. The Columbia River affords a channel for ocean shipping to Portland, Ore., and Vancouver, Wash., and depths suitable for commercial vessel traffic to the head of the pool formed by the Bonneville Dam, and thence depths for barge navigation upstream to and including the Snake River.

These systems of inland waterways were maintained and operated during the past fiscal year to provide for water-borne commerce and other traffic. The principal items of new work performed during the fiscal year included open-river regulating works on the Mississippi River between the Ohio and Missouri rivers consisting of 33 dikes and three revetments which were completed, and six dikes which were under construction at the end of the fiscal year. On the Missouri River between Sioux City, Ia., and the mouth, 14 dikes and 31 revetments were completed, and 12,900 linear feet of pile dikes and 13,157 linear feet of revetment were strengthened or replaced; in addition, eight dikes and 23 revetments were under construction at the end of the fiscal year.

GREAT LAKES

The Great Lakes—Superior, Michigan, Huron, Erie and Ontario—have natural deep water except in the connecting channels which have been artificially deepened where necessary to accommodate deep-draft vessels. They have an outlet to the Atlantic Ocean *via* the St. Lawrence River and the Oswego and Erie branches of the New York State Barge Canal system and the Hudson River.

During the fiscal year ended June 30, 1946, a 1,200-foot extension to the Southwest Pier in St. Marys River, Michigan, was completed except for paving behind the concrete cap; also the reconstruction of Brady Pier and construction of a mooring basin and boathouse were practically completed.

RIVER AND HARBOR AUTHORIZATIONS

The River and Harbor Act, approved July 24, 1946, Public Law 525, 79th Congress, and the Act approved Nov. 7, 1945, Public Law 213, 79th Congress, authorized 62 new river and harbor projects or modifications of existing projects having an estimated total cost of about $525,000,000. These projects include the improvement of Portland harbor, Maine; Fall River harbor, Massachusetts; New Haven harbor and Bridgeport harbor, Connecticut; Schuylkill River, Pennsylvania; Savannah harbor, Georgia; and Hollywood harbor, Florida. A waterway connecting the Tombigbee and Tennessee rivers, Alabama and Tennessee; improvement of Lake Charles deep-water channel, Louisiana; and the Overton-Red River waterway from the Mississippi River to Shreveport, La.; and the Arkansas River and tributaries in the interest of navigation, flood control, and power development, were also authorized. Other projects include the Sabine-Neches waterway, Texas; Cumberland River and tributaries, Kentucky, and Tennessee; Great Lakes connecting channels, Michigan; and Two Harbors, Minnesota. For the West Coast, Congress authorized the improvement of San Diego River and Mission Bay and the construction of the Sacramento deep-water channel, California; Coos Bay, Oregon; and the Columbia River between Vancouver, Wash., and The Dalles, Oregon.

WATER-BORNE COMMERCE

The total net water-borne commerce of the United States, eliminating all known duplications of traffic, aggregated 618,906,000 short tons in the calendar year 1945. A total of 123,901,790 short tons was carried on the Mississippi River and its tributaries, and 112,982,630 short tons were moved through the St. Marys Falls Canal connecting Lake Superior and Lake Huron.

NET TOTAL INLAND WATERWAY COMMERCE

Year	Short Tons
1930	226,760,000
1931	179,735,000
1932	151,276,000
1933	182,965,000
1934	194,786,000
1935	225,918,000
1936	276,264,000
1937	313,287,000
1938	277,755,000
1939	329,400,000
1940	366,800,000
1941	427,223,000
1942	423,336,000
1943	389,722,000
1944	402,731,000
1945	394,204,000

Total, State and Private Canals	4,645,584
Gross total, all Rivers, Canals and Connecting Channels	432,936,964
Net total, all Rivers, Canals and Connecting Channels (Corrected for duplications because of commerce moving over two or more waterways)	394,203,902

MISSISSIPPI RIVER SYSTEM

Works for the improvement of the channel of the Mississippi River proper were continued during the fiscal year ended June 30, 1946 at various places below Cairo, Ill., and the levees built for flood control from Rock Island, Ill., to near Head of Passes, La., now extend from 484 miles above to 966 miles below Cairo at the confluence of the Mississippi and Ohio rivers. Below Cairo revetment was in place over 135 miles of river bank, and 30 miles of permeable dikes are in place for bank stabilization and channel regulation. The 2,500-mile levee system was substantially completed and now contains nearly 1,200,000,000 cubic yards of earth. The Bonnet Carre spillway structure and the New Madrid floodway have been completed and are ready for operation when required. The flood control dam on the St. Francis River, and two of the four planned in the Yazoo River Basin have been completed and are in operation.

In the 655-mile reach of the Mississippi River above Alton, Ill., to Minneapolis, Minn., a system of low-head dams with locks provide a 9-foot channel depth for modern barge navigation. Below Alton the channel is maintained by open river works. The Ohio River and certain of its improved tributaries are also canalized to provide a 9-foot channel for commercial navigation serving this highly industrialized region. The system of six locks and dams on the Ouachita and Black rivers provides depths of 6½ feet at low water from the Red River to Camden, Ark., a distance of 351 miles. The Red River proper and the Arkansas River have been improved for light-draft navigation throughout a total length of more than 1,000 miles.

NATIONAL FLOOD CONTROL

Exclusive of the large projects previously authorized for the alluvial valley of the Mississippi River and the Sacramento River, in California, construction on the Federal program for general flood control was begun in 1937 after the first funds for that purpose were appropriated by Congress. By the end of June, 1946, 50 reservoirs and 135 local protection projects were in operation throughout the United States. In addition to previous authorizations, Congress in the Flood Control Act, approved July 24, 1946, authorized expenditures by the War Department amounting to $772,000,000 for approximately 123 additional flood control and multiple-purpose projects. With the passage of the 1946 Flood Control Act, Congress approved authorizations totaling $2,452,400,000 for the construction of about 770 reservoirs and local protection projects. In the period from 1937 through July 30, 1946, funds totaling $835,421,900 were appropriated for Flood Control General purposes of which $769,472,000 was for the construction and detailed planning of projects and the remaining $65,949,900 was for maintenance of completed projects, surveys, and miscellaneous items.

The authorized projects collectively constitute a comprehensive coordinated plan for the development of the river basins of the nation to provide economical flood protection and allied benefits for centers of industry and population, millions of acres of rich, agricultural land, and vital lines of communication. In addition to their use for flood control, many of the reservoirs provide favorable possibilities for the development of hydroelectric power, stream flow regulation, water conservation, recreation, and other water uses.

A number of projects were completed during the year, including the Indian Rock Dam in Pennsylvania and local protection works at East Peoria, Ill., Sauvie Island, Oregon, and in the Skamokawa Creek area, Washington.

RESUMPTION OF FLOOD CONTROL DEFERRED PROJECTS

Subsequent to the cessation of hostilities in the Pacific, Congress appropriated $84,659,000 in the First Deficiency Act for fiscal year 1946, and $138,901,000 in the War Department Civil Appropriation Act for fiscal year 1947, for continuing work on flood control projects deferred during the war emergency and for the initiation of new, urgently needed projects.

During the year, work was resumed on the flood protection projects in river basins throughout the nation which had been stopped during the war in order to conserve equipment, materials, and manpower. These projects include the Lisle and Elmira, New York, local protection projects in the headwaters of the Susquehanna River; the Plymouth, Wilkes-Barre, Williamsport, and York, Pennsylvania local protection works along the middle and lower Susquehanna River; the Wallace Lake Dam and Reservoir in the Red River Basin, Louisiana; the John Martin Dam and Reservoir, Colorado, the Blue Mountain Dam and Reservoir, Arkansas, and the Canton Dam and Reservoir. Oklahoma, all in the Arkansas River Basin; Clearwater Dam and Reservoir, Missouri in the White River Basin; local protection at the Kansas City and the Kanopolis Dam and Reservoir on the Smoky Hill River in Kansas, both in the Missouri River Basin; local protection works at Cincinnati and Massillon, O., the Cache River Diversion unit at Mounds and Mound City, Ill., and the Dale Hollow and Center Hill Dam and Reservoir projects on tributaries of the Cumberland River, all in the Ohio River Basin; Los Angeles River channel improvement and the Santa Fe Dam, both in Los Angeles County drainage area, California.

Projects previously authorized and for which plans and specifications were prepared during the war were initiated at the following localities: local protection at Nashua, N. H. in the Merrimack River Basin; the Union Village Dam and Reservoir on the Ompompanoosuc River in Vermont; local protection works at Whitney Point, New York and the Almond Dam and Reservoir, both units of the project for the headwaters of the Susquehanna River; Sunbury, Penn. in the Susquehanna River watershed; the Clark-Hill Dam and Reservoir project in the Savannah River Basin and the Allatoona Dam and Reservoir in the Coosa River Basin, Georgia; the Narrows Dam and Reservoir on the Little Missouri River, Arkansas; local protection for Shreveport, La. in the Red River Basin; Hulah Dam and Reservoir and Fort Gibson Dam and Reservoir, Oklahoma; Fall River Dam and Reservoir, Kansas; Wister Dam and Reservoir, Oklahoma, all in the Arkansas River Basin; the Bull Shoals Dam and Reservoir, Arkansas, in the White River Basin; Harlan County Dam and Reservoir on the Republican River, Nebraska; Cherry Creek Dam and Reservoir for the protection of Denver, Col., local protection works at Kensler's Bend, Schuyler and Omaha, Nebraska, and Council Bluffs, Ia. and the main Missouri River dams at the Fort Randall and Garrison sites, all in the Missouri River Basin; Delaware Dam and Reservoir, Ohio; Dewey Dam and Reservoir, Kentucky; and the Conemaugh Dam and Reservoir project, Pennsylvania, local protection works at Newport, Ky., Punxsutawney, Penn., Parkersburg and Elkins, W. Va., all in the Ohio River Basin; and the Dorena Dam and Reservoir in the Willamette River Basin, Oregon.

The separately authorized project for the Sacramento River and its tributaries in California, will provide flood protection for cities and towns, fertile agricultural lands, and railway and highway facilities of great importance to the economy of the western United States. Work was continued on this project throughout the year, including levee construction along the Sacramento, American, and Feather rivers, and the clearing of obstructions in Butte Slough and the Sutter by-passes.

FLOOD DAMAGE

Although the year 1946 was not a serious flood year from the national viewpoint, there were many flash floods which caused very serious damage to relatively small areas. The more important floods during the year include a very serious flood which struck the Willamette River Basin in late December 1945 and early January, 1946, and caused damages estimated at $6,000,000. The reduction in damages credited to the operation of the completed Cottage Grove and Fern Ridge Reservoirs is estimated at $1,200,000. The Yazoo River had two floods in the spring of

1946 which closely approached the all-time record for that stream. The end of May saw the North and West branches of the Susquehanna River at near record flood stage. The October flood of the North Canadian River in Oklahoma inundated portions of Oklahoma City as well as other urban and agricultural land along that stream and its tributaries.

PART FOUR

ECONOMICS AND BUSINESS

DIVISION X

BUSINESS AND FINANCE

ECONOMIC AND BUSINESS CONDITIONS

By S. S. Huebner
Professor, University of Pennsylvania

BUSINESS GOOD DESPITE RECONVERSION HANDICAPS

Serious labor disturbances, as well as confusing governmental price and priority regulations, prevailed during nearly all of 1946, and tended to retard the reconversion procedure of business from a war to a peacetime economy. Despite the handicaps and confusion, however, the year 1946 presents a remarkable record of business in both commodity volume and dollar value. Nearly all of the leading business barometers show a gain over 1945, but where that gain happens to be expressed in dollars, it must be interpreted in the light of the strong inflationary tendency of the year and the marked corresponding depreciation in the dollar.

Viewing economic barometers as a whole, substantial increases occurred along nearly all important lines of business activity. Total crop production for the year exceeded by 2.5 per cent the previous peak year of 1942 and, with the exception of cotton, all leading crops showed up most favorably as regards both volume and quality. Moreover, the agricultural group, and the same may also be said for the manufacturing and mining groups, enjoyed a substantial rise in price for nearly all of the basic commodities. New capital flotations for the year were more than twice those of 1945. The steel industry operated during the current year on an annual basis of 63,000,000 tons of steel. With the exception of 1929 when 63,205,000 tons were produced, the 1946 production exceeded that of any other year in the industry's history prior to the war. New construction showed a decided improvement, the dollar value being more than twice that of 1945, and larger than for any previous year except the peak war production program year of 1942.

Electric output for the year exceeded that of 1945 by about 14 per cent. Exports and imports, when combined, remained about the same as the 1945 total. Automotive output also grew to a monthly rate better than for the pre-war years of 1938 or 1939. For the first nine months, corporate dividends on common stock issues listed on the New York Stock Exchange exceeded those for the corresponding period of 1945 by nearly 13 per cent. Using the figures of the Federal Reserve Board, industrial production figures, as explained later in this account, showed very substantial increases, compared with the previous year, in nearly all of the important lines of business activity.

Similarly the Federal Reserve figures show substantial increases in employment in nearly all leading business pursuits and an extraordinary increase in wages.

SOME BAROMETRIC EXCEPTIONS

The only noteworthy barometric exceptions, showing decreases for 1946 when compared with 1945, were bank clearings, railroad freight loadings, bituminous coal production, commercial failures, and stock market price movements. Bank clearings at the end of the current year were down by about 16 per cent as compared with 1945. Railroad freight car loadings for the first 11 months were down by about 2.2 per cent, while for the same period bituminous coal production decreased by 8.7 per cent. Commercial failures, with respect to both number and amount of liabilities, were somewhat higher than the excellent showing of 1945, but still very good when compared with the previous decade.

Of all leading economic barometers, the 1946 stock market presents the darkest picture. During the first half of the year, the average stock price level showed a slight appreciation over the closing level of 1945, but following June a bear market began to run its course and continued until the close of October with increasing violence. Comparing the October average with the January average of 1946, railroad stocks declined by 32.4 per cent, industrial stocks by 17.3 per cent, public utilities by 16 per cent, and coppers by 17 per cent. Combining the first three leading groups, the depreciation, as reported by the Standard and Poor's index, amounted to 18.1 per cent, as compared with an appreciation of 22.33 per cent for the corresponding period of 1945. The reversal in the stock market trend was so abrupt, in fact, as to bring about a public stressing of the likelihood of a business depression having been discounted by the stock market. Many factors contributed to bring about the speculative change from optimism to pessimism, but the principal reasons seemed to be the exceedingly large number of strikes throughout the nation, particularly in the major industries, the rapid increase in wages, the inability of many industries, owing to governmental restrictions, to obtain compensating price increases, and the fear engendered by the inflation spiral which seemed to engulf the nation's industrial activities. Although these factors continued their influence to the end of the year, the violent stock market reaction seemed to be halted, at least temporarily, by the November election with its landslide trend to the right.

AGRICULTURE

At the beginning of October, estimates of 1946 crop production by the Department of Agriculture placed the total at 2.5 per cent in excess of the previous peak of 1942 and 26.4 per cent above the 1923-32 average. Corn, as the outstanding crop, was expected to yield 3,374,000,000 bushels, compared with 3,018,000,000 in 1945 and a 1935-44 average of 2,608,000,000 bushels. Moreover, the quality of corn was exceptionally good, whereas the year before there was an unusually poor average quality. The feed grain crops of all kinds were expected to total 127,500,000 tons, or 4 per cent more than the 1942 peak. Moreover, as reported by the *Guaranty Survey* (Oct. 30): "Indicated production of food grain, a peak total of 37,400,000 tons, includes 1,169 million bushels of wheat—a winter crop of 879 million and a spring crop of 289 million bushels. The food-grain output apparently will be 19% larger than the quantity reported last year and 14% above average. Other major agricultural products promising record yields this year include potatoes, tobacco, peaches, pears, plums and truck crops."

The only very unfavorable crop was cotton, the estimated yield being only 8,724,000 bales as compared with 9,015,000 bales in 1945 and a 1935-44 average of 12,553,000 bales. The 1946 cotton crop was the smallest since 1921, and fell considerably short of indicated domestic and export demands.

Prices of leading farm products during 1946 showed very large increases along nearly all lines. Thus. using closing prices for agricultural commodities, quotations on Nov. 1. 1946 (*Guaranty Survey,* Nov. 27. 1946, and *Babson's Price Trends,* Nov. 25, 1946), compare as follows with prices on the corresponding date in 1945: wheat, No. 2 red, winter, Chicago, per bu., $2.17 as compared with $1.80; corn, No. 2 yellow, Chicago, $1.40 as compared with $1.18½; rye, No. 2, New York, per bu., $2.855 compared with $1.959; oats, No. 2 white, Chicago, per bu., $.92 compared with $.688; cotton, middling, spot, New Orleans, per lb., 29.55¢ as compared with 22.35¢. The following additional prices may be mentioned (*Babson's Price Trends,* Nov. 25, 1946) by way of comparison with the same date for 1945: beans, domestic pea, cwt., $15 as compared with $6.82; butter, creamery, ex. (92 score), lb., $.775 as compared with $.423; cheese, Fancy Flats, Held, New York State, lb., $.31 compared with $.31; eggs, mixed colors, standards, doz., $.38 compared with $.461; flour. Spring 80 per cent, Minn., cwt., $5.42 with $3.34; lard, choice Western, lb., $.40 compared with $.138; flaxseed, cash closing, Duluth, bu., $7.25 compared with $3.10; barley, Milwaukee. bu., $1.67 compared with $1.303; cattle, live, weekly aver., Chicago, cwt., $25 with $17.10; hogs, live, weekly aver., Chicago, cwt., $23.40 with $14.80; and sheep, live, weekly aver., Chicago, cwt., $7.25 with $5.10.

MANUFACTURING AND MINING INDUSTRIES

In these industries, price increases during 1946 as compared with 1945. were also very substantial. Comparing November, 1946, with the corresponding quotations for 1945, the following price comparisons may be selected from those listed in the *Guaranty Survey* (Nov. 27, 1946): coffee, 26.50¢ per lb. as compared with 13⅜¢; copper, 17.37½¢ per lb. as compared with 11.87½¢; hides, 32.00¢ per lb. as compared with 15½¢; pig iron, $28.00 per gross ton as compared with $25.25; steel billets, Pittsburgh, $39 per gross ton compared with $36.00; lead, 10.50¢ per lb. compared with 6.50¢; petroleum, Pennsylvania, $3.41 per bbl. compared with $3; rosin, $7.82 per 100 lbs. compared with $6.76; rubber, .22½¢ per lb. compared with .22½¢; sugar, 5.57½¢ per lb. compared with 3.75¢; tin, 70.00¢ per lb. compared with 52.00¢; wool, Ohio fine delaine, per lb., $1.14 compared with $1.21; and zinc, 10.50¢ per lb. as compared with 8.25¢.

NEW CAPITAL FLOTATION

As explained in last year's issue, new capital financing (as distinguished from refunding issues) approximately doubled during 1945 as compared with 1944, while 1944 also represented a doubling of the 1943 record. The total new capital financing for the first nine months of 1946 (latest available) aggregated $1,989,589,000, as compared with $927,461,000 for the corresponding period of 1945, and with $459,000,000, $200,000,000, and $614,000,000 for the corresponding months of 1944, 1943, and 1942. For the corresponding period of 1946, the showing of $1,990,000,000 also compares with $770,000,000 for 1941, $458,000,000 for 1940, $311,000,000 for 1939, $316,000,000 for 1938, and $1,154,000,000 for 1937. It should also be noted that a considerable monthly fluctuation in new capital flotations took place during 1946. Thus, for January, February, and September, the monthly totals reached only $131,000,000, $47,000,000, and $170,000,000, respectively, whereas for April, June, July, and August. the monthly totals reached $290,000,000, $307,000,000, $367,000,000, and $354,000,000, respectively.

The total of refunding issues for the first nine months of the year showed a considerable decrease, the total standing at $2,635,072,000 in contrast to the corresponding figure for the same period of 1945 of $3,508,771,000. The 1946 figure also compares, for the corresponding period, with $1,362,000,000 for 1944, $445,000,000 for 1943, and $296,000,000 for 1942. The 1946 figure may also be compared with the corresponding figures of $1,354,000,000 for 1941 and $1,252,000,000 for 1940. It should also be noted that the new capital totals for the first nine months of 1946, $1,990,000,000, greatly exceeds the total for all of 1945, namely, $1,255,000,000. By way of contrast, the refunding total for the first nine months of 1946, $2,635,000,000, is but slightly more than half of the 1945 yearly total of $4,911,000.000.

CORPORATE FINANCING

	1945		1946	
	Capital	Refunding	Capital	Refunding
January	$ 44,071,000	$278,900,000	$131,170,000	$112,954,000
February	28,925,000	137,182,000	47,089,000	264,262,000
March	68,072,000	295,766,000	127,315,000	284,215,000

BANK CLEARINGS

Bank clearings for 1946, despite violent inflationary tendencies, fell considerably below those of 1945 and 1944. The grand total for the week ended Nov. 30 (*Commercial and Financial Chronicle*), for 111 cities, was $11,174,530,964, as compared with $13,393,754,063 for the corresponding week of 1945, a decrease of 16.6 per cent. For the corresponding week of 1944 and 1943, the totals were $13,619,784,416 and $9,856.279,499, respectively. Exclusive of New York City, the nation's Federal Reserve Districts show total bank clearings for the week ended Nov. 30 of $5,321,989,623, an increase of only 0.4 per cent as compared with the 1945 corresponding week's total of $5,303,029,445. The showing for 1946, exclusive of New York City, also compares with $5,712,823,131 and $4,689,381,123 for the corresponding week of 1944 and 1943, respectively. The respective gains and losses for each of the 12 Federal Reserve Districts, for the week ended Nov. 30, 1946, in comparison with 1945, are shown by the following table:

Federal Reserve District	1946 millions	1945 millions	Increase or Decrease %
First—Boston (12 cities)	434	512	−15.2
Second—New York (12 cities)	6,037	8,283	−27.1
Third—Philadelphia (10 cities)	723	749	− 3.4
Fourth—Cleveland (7 cities)	618	612	+ 1.1
Fifth—Richmond (6 cities)	314	343	− 8.4
Sixth—Atlanta (10 cities)	484	448	+ 7.9
Seventh—Chicago (17 cities)	762	741	+ 2.8
Eighth—St. Louis (4 cities)	366	350	+ 4.5
Ninth—Minneapolis (7 cities)	272	248	+ 9.8
Tenth—Kansas City (10 cities)	373	330	+13.1
Eleventh—Dallas (6 cities)	192	189	+ 1.7
Twelfth—San Francisco (10 cities)	599	589	+ 1.7
Grand Total (111 cities)	11,175	13,394	−16.6
Outside New York City	5,322	5,303	+ 0.4

SECURITY MARKETS

The 1946 security market seems to mark the end of the 1943-46 bull market, and furnishes a picture more dismal than any of the other leading economic barometers. Two main trends occurred during the year: (1) a slight appreciation, as compared with the close of 1945, in the price level during the first five or six months, and (2) a bear market of very sizable proportions following June and continuing with increased violence during July and October, inclusive. Despite the very high price level, gilt edge bonds continued to hold their 1945 level during the first nine months of the current year. In October, however, a decline occurred from a September high average of 119.1 to an October high average of 116.2, or 2.9 points.

Combining the three leading groups of stocks (Standard and Poor's Index)—railroads, industrials and public utilities—the October, 1946, average price of 117.2 when compared with the January average of 143.1 shows a depreciation for the first ten months of the year of 18.1 per cent. This compares with an appreciation of 22.33 per cent for the same period of 1945, and with 8.2 per cent for the same period of 1944. For the first ten months of 1946, the following price declines, comparing the October average with the January average, occurred in the four leading groups of stocks: railroad stocks from 66.7 to 45.1, or a decline of 32.4 per cent; industrial stocks from 172.8 to 142.9, a decline of 17.3 per cent; public utilities from 88.5 to 74.3, a decline of 16 per cent; and coppers from 132.2 to 109.7, a decline of 17 per cent. The annual volume of transactions on the New York Stock Exchange was slightly less than during 1945, namely, 363,709,312 shares, as compared with 377,564,000 for 1945. Million and million and a half share days were, as in 1945, the general rule. Transactions on the New York Curb Exchange were also about the same as in 1945.

The change during the current year from speculative optimism to pessimism was very marked. In fact, press accounts during recent months have stressed the likelihood of a business depression having been discounted by the stock market. (See summary under the section on "The Security and Money Markets.")

RAILROAD INDUSTRY

The year 1946 showed a somewhat smaller railroad traffic than prevailed during 1945 and the preceding four years, as described in previous issues of THE AMERICAN YEAR BOOK. According to the Association of American Railroads (announcement Dec. 5), revenue freight car loadings during the first 11 months of 1946 totaled 38,319,186, a decrease of about 2.2 per cent when compared with the 1945 total, for the same period, of 39,176,328. For the same period of 1944, the total stood at 40,517,049.

Earnings, however, have not been maintained as has the volume of traffic. According to the Association of American Railroads, Class I railroads of the United States, representing a total of 227,702 miles, had an estimated net income during the first ten months of 1946, after interest and rentals, of $155,000,000, compared with a net income of $473,196,000 for the corresponding period of 1945. Net railway operating income, before interest and rentals, totaled $450,730,000, compared with $830,561,000 in the same period of 1945. According to the same report, the rate of return on property investment for the 12 months ended Oct. 31, 1946, averaged 1.7 per cent, compared with a rate of return of 3.57 per cent for the 12 months ended Oct. 31, 1945.

COAL AND COKE PRODUCTION

Despite unusual labor troubles, production in this important industry showed only a comparatively small decline from the record production of the previous year. From Jan. 1 to Nov. 30, 1946 (latest available), the total output of bituminous coal and lignite amounted to 485,000,000 net tons compared with 531,000,000 tons produced during the corresponding period of 1945, a decrease of 8.7 per cent. Beehive coke production for the week ended Nov. 23, 1946, totaled 6,470,000 tons, compared with 10,340,000 tons for the corresponding week of 1945, a decline of 37.4 per cent.

EXPORTS AND IMPORTS

Exports of merchandise for the first nine months of 1946 (latest available) totaled $7,118,000,000, as compared with $7,975,000,000 in the corresponding 1945 period. The year's total compares with exports of merchandise for the first nine months of 1944 of $10,741,746,000, of $9,107,368,000 for the corresponding period of 1943, and with annual totals of $4,022,000,000 for 1940, $3,177,000,000 for 1939, $3,094,000,000 for 1938, $3,349,000,000 for 1937, and $5,241,000,000 for the record peace year of 1929.

Total imports during the first nine months of 1946 rose to $3,519,000,000 from $3,172,000,000 in the corresponding period of 1945. The 1946 total also compares with $2,923,000,000 for the corresponding period of 1944, with $2,449,000,000 for the same period of 1943, and with annual totals of $2,626,000,000 for 1940, $2,318,000,000 for 1939, $1,960,000,000 for 1938, $3,084,000,000 for 1937, and $4,399,000,000 for the record peace year of 1929.

The enormous difference between exports and imports during 1946 and 1945 still reflects abnormal war conditions. As explained in previous years, this business barometer became badly warped by war conditions, which will wear off only gradually. It should be noted, however, that a material decline in 1946 exports during September, $641,000,000 compared with $881,000,000 during August, the peak month for the year, is traceable mainly to the effects of the maritime strike, with a heavy decline in the exportation of finished manufactures. A substantial decline in September imports (11 per cent) when compared with August was owing to a falling off in receipts of raw materials and foodstuffs, principally furs, coffee, sugar, and silk.

AUTOMOTIVE INDUSTRY

Previous yearly accounts describe the almost complete operation of this industry in war production and the necessity, therefore, of an almost complete reconversion to peacetime production. Much reliance was placed upon a rapid reconversion, but unfortunately this important manufacturing industry remained disorganized during much of 1946 by strikes and materials' bottlenecks. In fact, most of the business was shut down for about three months by a general strike which affected all of the producers in this category, and subsequently strikes continued for months in many of the manufactories of automotive parts.

Despite the labor difficulties, however, the industry made considerable headway. On Nov. 18, the Civilian Production Administration announced that passenger automobile output for October reached a new post-war peak of 285,562 units, a gain of 46,152 over September, and a rate of production "better than the monthly rate for either 1938 or 1939 but slightly lower than the monthly rate for 1940 and 1941." Truck production for October also increased to a post-war monthly high of 109,953 units, a gain of nearly 18,000 over September.

The Civilian Production Administration estimated that the 1946 output would reach about 2,200,000 cars, compared with 1941 production of 3,755,309 units and 3,914,511 in 1937. Manufacturers' forecasts for the three months following October were reported as 271,315 units for November, 294,199 units for December, and 344,448 units for January.

IRON AND STEEL OPERATIONS

As was the case in 1945, this basic industry again suffered from two severe coal strikes during 1946. In addition, however, the year also witnessed an important strike within the industry itself, as well as numerous strikes in important steel-consuming industries such as the automotive and electrical industries. Had it not been for these numerous shutdowns the year's production would have been a record one. As explained by *The Iron Age* (Dec. 26): "Had it not been for the steel strike and the two coal strikes during the year, steel industry output could reasonably have been expected to reach 81,000,000 to 83,000,000 tons of ingots. Instead of this figure, estimated output for this year indicates a total steel ingot production of 65,900,000 tons. This experience indicated that because of strikes and the confusion in scheduling iron and steelmaking programs before and after such shutdowns resulted in a loss of more than 16,000,000 tons of steel ingots during this year."

According to the American Iron and Steel Institute, the last week's operations (ending Dec. 31) of the steel industry were scheduled at 87.7 per cent of rated capacity, equivalent to 1,545,600 tons. This rate compares with 60.2 per cent or 1,061,000 tons a month ago, and with 83.8 per cent. or 1,476,300 tons a year ago. It should also be noted that, since OPA price controls were removed on iron and steel scrap, the price of heavy melting steel has advanced about $12 a ton, although in some instances the net advance has been about $9.50 a ton.

ELECTRIC OUTPUT

According to the Edison Electric Institute, the production of electricity by the electric light and power industry of the United States totaled 4,672,712,000 kwh. for the week ended Dec. 7, 1946. This output compares with 4,096,954,000 kwh. for the corresponding week of 1945, thus showing an increase of 14.1 per cent. During the three months preceding Dec. 7, the weekly output for 1946 was consistently over that of 1945, the weekly increase ranging from a minimum of 10 per cent to a maximum of 24 per cent. The output of 4,672,000,000 kwh. for the week ended Dec. 7, 1946, also compares with 4,097,000,000 kwh. for the corresponding week of 1945. 4,538,000,000 for the corresponding week of 1944, 4,560,000,000 for the week of Dec. 1, 1943, 3,884,000,000 for the corresponding week of 1942, 3,976,000,000 for 1941, 2,755,000,000 for 1940, 1,415,000,000 for the depression year of 1932, and 1,637,000,000 for the prosperity year of 1929.

BUILDING CONSTRUCTION

Despite many difficulties, this important industry showed decided improvement over 1945. According to the F. W. Dodge Corporation Reports, the total volume of construction contracts awarded in 37 eastern states during the first ten months of 1946 amounted to $6,528,700,000. The indications, as reported, are that there will be a larger construction total for the entire year than for any previous year except 1942, which was the peak year of the war construction program. It is also reported that the

1946 dollar total will be equal to about 2¼ times that of 1945. Classified, the aforementioned ten months' contract total of $6,528,700,000 comprised the following: non-residential buildings, $2,407,400,000, or 37 per cent; residential buildings, $2,727,600,000, or 42 per cent; and heavy engineering construction, $1,393,700,000, or 21 per cent. Residential building for the year, it is expected, will exceed in dollar volume any previous year on record.

COMMERCIAL FAILURES

Last year's account explained that the 1945 record of commercial failures was exceedingly good, and that it showed a continuation of the steadily improving business failure situation during the past nine years. The 1946 failure record for the first eight months (latest available) shows an increase in failures as compared with the corresponding period of 1945, but not to any unusual degree. The number of business failures reported by Dun and Bradstreet for the first eight months of the year amounted to only 666 as compared with 582 for the same period of 1945. It also compares with 905 for the first nine months of 1944, and with 2,752, 7,641, 9,299. 10,398, and 11,197 for the corresponding nine months period of 1943, 1942, 1941, 1940, and 1939, respectively The eight months' record of 1946 (666) also compares with full yearly records of 12,836 for 1938, 9,490 for 1937, 9,607 for 1936, 12,244 for 1935, 12,091 for 1934, 19,859 for 1933, and 31,822 for 1932, the bottom year of the depression.

With respect to failure liabilities. 1946 also shows a moderate increase as compared with the remarkably good 1945 record. For the first eight months of the year, total liabilities of failures amounted to $29,456,000 as compared with $22,531,000 for the corresponding period of 1945, and with nine months' records of $23,029,000, $37,097,000, $81,387,000, $106,105,000, $124,085,000, and $138,612,000 for 1944, 1943, 1942, 1941, 1940, and 1939. The 1946 eight months' record ($29,456,000) also compares with the following full yearly records of $30,395,000 for 1945, $31,660,000 for 1944, $45,339,000 for 1943, $100,763,000 for 1942, $136,000,000 for 1941, $167,000,000 for 1940, $168,000,000 for 1939, $247,000,000 for 1938, $183,000,000 for 1937, and $928,000,000 for 1932, the bottom year of the depression.

CORPORATE DIVIDENDS

According to the New York Stock Exchange's monthly magazine, *The Exchange,* dividends of 746 separate common stocks listed on the New York Exchange (against 742 dividend payers in 1945), for the first nine months of 1946, exceeded those of the corresponding period of 1945 by 12.6 per cent. Three hundred and twenty paid the same dividend as in the preceding year, 376 increased their dividend distribution, 50 paid lower dividends, and 32 suspended or deferred dividends altogether. In the aggregate the dividend disbursement of all the stocks for the nine months ended Sept. 30 amounted to $1,751,160,000, as compared with $1,555,577,000 during the corresponding period of 1945 and $1,474,967,000 in 1944.

The Stock Exchange's list contains 29 categories of stocks. Of these, 16 of the categories showed exceptionally large gains, namely, "amusement," 84.5 per cent; "aviation," 64.4 per cent; "building," 20.6 per cent; "business and office equipment," 18 per cent; "chemical," 19.2 per cent; "finance," 21.8 per cent; "food," 17.3 per cent; "paper and publishing," 79.8 per cent; "petroleum," 14.3 per cent; "railroad," 10.7 per cent; "retail merchandising," 44.8 per cent; "rubber," 36.2 per cent; "ship operating," 58.2 per cent; "textile," 51.6 per cent; "transportation services," 150.5 per cent; and "other companies," 44.3 per cent. Ten of the categories showed gains ranging from 0.2 per cent to 7.6 per cent, and of these the following important ones should be mentioned: "electrical equipment," 3.2 per cent; "farm machinery," 7.6 per cent; "leather and shoe manufactures," 6.3 per cent;

"machinery and metal products," 2.2 per cent; "mining," 7.6 per cent; "steel, iron and coke," 5.4 per cent; and "utilities," 6.2 per cent. Only three categories out of the 29 showed declines: "automotive," with a decline of 14.6 per cent; "shipbuilding," with 6.4 per cent; and "tobacco," with 1.9 per cent. Commenting on its detailed report, *The Exchange* (October, 1946) makes the following comment:

"Although dividend payments were reduced on 50 issues of common stocks listed on the New York Stock Exchange, and deferred or eliminated on 32 others, the first nine months of 1946 had a sturdy record of disbursements to stockholders. Of the 29 rosters of industrial, public utility, transportation and communication stocks on the Stock Exchange only two disclosed declines from 1945. . . .

"The automotive group, whose operations and profits have been disorganized by strikes and materials' bottle-necks, was one of the two categories to fall back this year. Of the 65 motor and accessory stocks listed, seven which made a return to shareholders during the first three-quarters of 1945 paid out nothing this year. These listed corporations, accounting to a material degree for the decline of 14.6 per cent in automotive dividends, were all suppliers to motor car makers, with the exception of Packard Motor. The retreat of disbursements was also stimulated by a drop from 75 cents to 50 cents in the General Motors dividend several months ago."

GENERAL BUSINESS INDICES

Using the industrial production figures of the *Federal Reserve Bulletin* (adjusted for seasonal variation), it appears that the record for September, 1946 (latest figures available), shows a mixed situation as regards increases or decreases in the important lines of business as compared with 1945, with increases, many of them very substantial, largely in the majority. Thus, increases were shown in 11 leading types of industries, comparing September, 1946, with September, 1945, as follows: iron and steel with an increase from 163 to 184, machinery from 230 to 257, plate glass from 79 to 161, nonferrous metals from 139 to 162, beehive coke from 224 to 361, textiles from 144 to 165, newsprint consumption from 93 to 117, lubricating oil from 119 to 152. bituminous coal from 148 to 163, anthracite coal from 114 to 125, and petroleum crude from 138 to 149. Between the same dates, declines are recorded in four leading industries: transportation equipment with a decrease from 273 to 245, meat packing from 141 to 38, manufactured food products from 144 to 134, and silver from 51 to 35. In contrast to the above, a maintenance of conditions was indicated between September, 1945, and September, 1946, in three leading industries: wheat flour with a slight increase from 127 in September, 1945, to 128 in September, 1946, leather products with an increase from 119 to 120, and tobacco products with a decrease from 160 to 157.

COMMODITY INDEX NUMBERS

Using the U. S. Department of Labor wholesale price index for main groups of commodities, 1946 experienced a very marked upward trend in the price level, namely, from 107.1 for January, 1946, to 124 for September (latest available). The January index figure of 107.1 compares with 104.9 for January, 1945, 103.3 for January, 1944, 101.9 for January, 1943, 96 for January, 1942, and 80.8 for January, 1941. During the first nine months of 1946, this index represents a price increase of 15.8 per cent, and since January, 1941, of 53.3 per cent. The September, 1946, figure of 124 compares with total yearly averages of 105.8 for 1945, 104 for 1944, 103.2 for 1943, 98.8 for 1942, 87.3 for 1941, 78.6 for 1940, 77.1 for 1939, 78.6 for 1938, 86.3 for 1937, 80.8 for 1936, 80 for 1935, 75 for 1934, 66 for 1933, 64.9 for 1932, and 154.4 for 1920, the highest yearly average under this index since the beginning of the century. As already explained under the sections dealing with "Agriculture" and "Manufacturing and Mining Industries," price changes for leading commodities in these fields during 1946 were mostly upward to an unusual extent.

It is also interesting to note that the United Kingdom Board of Trade index shows a very much smaller increase for 1946 than was the case in the United States, namely, from 169.6 for January, 1946, to only 174.9 for September (latest available). The latter figure compares with 167.2 for January, 1945, 164 for January, 1944, 162.1 for January, 1943, 156.4 for January, 1942, and 149.5 for January, 1941. In tabular form, the index numbers of the United States Department of Labor and of the United Kingdom Board of Trade for leading groups of commodities at the close of the year, compared with former years, are as follows:

INDEX NUMBERS OF COMMODITY PRICES

	U. S. Dept. of Labor		U. K. Board of Trade	
	1945	1946	1945	1946
January	104.9	107.1	167.2	169.6
February	105.2	107.7	167.2	169.4
March	105.3	108.9	167.8	169.7
April	105.7	110.2	167.7	170.3
May	106.0	111.0	168.4	170.8
June	106.1	112.9	170.1	171.2
July	105.9	124.7	170.8	174.1
August	105.7	129.1	170.6	174.3
September	105.2	124.0	169.6	174.9
October	105.9		169.4	
November	106.8		169.4	
December	107.1		169.1

LABOR CONDITIONS

With respect to labor conditions, using September as the basis (latest date furnished by the *Federal Reserve Bulletin*), 1946 employment shows large increases along nearly all important lines as compared with the same month of 1945. For iron and steel, the increase (unadjusted for seasonal variations) extended from 125.1 to 146.2, electrical machinery from 171.5 to 207.1, automobiles from 105.9 to 189.7, nonferrous metals from 131.2 to 173.6, lumber and timber and basic products from 120.8 to 150, furniture and lumber products from 92.4 to 119.1, textile mill and fiber products from 91.9 to 105.5, leather products from 88 to 100.4, paper and allied products from 117.5 to 138, printing and publishing from 98.8 to 118, products of petroleum and coal from 123.3 to 143.8, rubber products from 136.5 to 189.4, and miscellaneous industries from 136.5 to 176.4. For the total of durable goods (unadjusted for seasonal variation) the increase in employment from September, 1945, to September, 1946, extended from 144.9 to 169; and, when adjusted for seasonal variation, from 144.8 to 168.8. For the total of nondurable goods (unadjusted) the increase from September, 1945, to September, 1946, extended from 115.6 to 128.4; and, when adjusted, from 114.5 to 127.1. Of all the groups included in the Federal Reserve Bulletin's list, only three showed decreases during the year, from September to September (unadjusted): transportation equipment, exclusive of automotive, from 496.5 to 287.3, chemical and allied products from 172.1 to 167.1, and food products from 138.4 to 132.0.

With respect to payrolls, extraordinarily large changes were shown in nearly all of the leading industries, according to the payroll index furnished by the *Federal Reserve Bulletin*. The leading increases from September, 1945, to August, 1946, are as follows (unadjusted for seasonal variation): iron and steel products from 206.9 to 255.2, electrical machinery from 268.5 to 360, machinery, except electrical from 285.7 to 348.8, automobiles from 151.2 to 308, nonferrous metals from 222.3 to 311.4, and lumber and timber and basic products from 215.3 to 300.3. For durable goods taken as a whole, the payroll figure shows an increase (September, 1945, to August, 1946) from 246.2 to 306, and for non-durable goods an increase from 202.6 to 250.3. Of all the groups included in the *Federal Reserve Bulletin's* list, both durable and non-durable, only two showed payroll decreases during the year, from September, 1945, to September, 1946, namely, transportation equipment, exclusive of automotive, from 844.1 to 534, and chemical and allied products from 292.2 to 290.5. According to the latest available report of the *Federal Reserve Bulletin,* the 1946 showing for leading types of industries, as regards both employment and payrolls, is as follows:

FACTORY EMPLOYMENT AND PAYROLLS

	Employment						Payrolls		
	Adjusted for Seasonal Variation			Unadjusted for Seasonal Variation			Unadjusted for Seasonal Variation		
	Sept. 1946	Sept. 1945	Sept. 1944	Sept. 1946	Sept. 1945	Sept. 1944	Aug. 1946	Sept. 1945	Sept. 1944

THE SECURITY AND MONEY MARKETS

By S. S. Huebner
Professor, University of Pennsylvania

GENERAL

Stock market movements during 1946 indicated two main trends: (1) a slight appreciation in the price level during the first five or six months, depending upon the group of stocks under consideration, and (2) a bear market of very substantial proportions following June and continuing with increased momentum through the months of July, August, September, and October. June, 1946 seemed to have marked the end of the 1943-1946 bull market.

The average monthly price level for the leading groups of stocks, at the end of the first ten months of the year (latest available), showed a depreciation of 18.1 per cent as contrasted with an increase of 22.3 per cent during the same period of 1945. For the four leading groups of stocks, the depreciation for the first ten months of the year, comparing the January and October monthly averages, was 32.4 per cent for railroad stocks, 17.3 per cent for industrials, 16 per cent for public utilities, and 17 per cent for the copper group. The total volume of transactions on the New York Stock Exchange nearly reached the 364,000,000-share figure (about the same as the 377,000,000 total for 1945), while transactions on the Curb Market (137,000,000 shares) were also about the same as those for 1945. Million-share days on the New York Stock Exchange were the general rule throughout the year, and during two months of the first ten months of the year the daily average well exceeded 2,000,000 shares. This activity compares with about the same record for 1945.

1946 MARKET TRENDS

Using a combined average for the leading groups of stocks, railroads, industrials, and public utilities (Standard and Poor's Index), the 1946 market was characterized by two distinct trends, with only slight variations during the first five months. These two price trends of the year may be indicated as follows: (1) a slight rise from January to June of monthly averages, from 143.1 to 148.5, or 3.8 per cent, and (2) a major decline from June to October, inclusive, from 148.5 (May average) to 117.2 (October average), a decrease of 21 per cent. Impressive as the aforementioned decrease is, it should be noted that many of the leading corporate shares experienced a substantially greater decline. Using ten giants for illustrative purposes—Allied Chemical and Dye, American Smelting and Refining, American Telegraph and Telephone, American Tobacco, Bethlehem Steel, Chrysler Corporation, E. I. du Pont de Nemours, General Motors, Standard Oil of New Jersey, and United States Steel—the average high price for the common stocks for 1946 of 132.1 compares with the average closing price on Nov. 26, 1946, of 92.5, or an average decline of 30 per cent.

Bonds, using the Standard and Poor's Index for corporate bonds, maintained for the first nine months of 1946 the unusually high price level reached by the close of 1945, the January, 1946 high average being 120.2 and the September average 119.1. During October, however, this average declined rather drastically from 119.1 (September) to 116.2 (October), a decline of 2.9 points. Comparing January of 1946 with October of 1946, bonds showed an average price depreciation of approximately 3.3 per cent.

Throughout 1945, as explained last year, "the stock market increasingly threw off the cautious hesitation and selectivity which characterized the market during 1944." The war having ended, an ever increasing number of factors were stressed by the speculative community as supporting the bull side of the market. The following seemed to command the most attention: a strong undercurrent of inflation thinking; an enormous pressure of idle funds seeking investment at a time when the volume of good bonds was greatly depleted owing to refunding operations; favorable corporate earnings and increased dividend declarations, whereas the return on good bonds was exceedingly small; the prospect of Federal tax legislation designed to reduce corporate as well as individual taxes; the prospect of the abolition of governmental price and other economic restrictions; and the widely held belief in a huge postwar boom to meet the needs of a foreign war-torn world as well as to fill the greatly depleted backlogs of domestically needed goods, repairs and new construction.

This bull psychology continued during the first half of 1946. By May and June, however, the bullish enthusiasm seemed to vanish and increasingly bearish considerations gained the upper hand. Various events made it clear that the hoped for reconversion of business from war to peace and the prospective industrial boom were not to materialize immediately, if at all. An enormous increase in the number of industrial strikes, extending to the major industries representing iron and steel, coal, electrical power, automotive manufacturing, etc., took place throughout the country. Most of these strikes proved victories to labor in the form of substantial wage increases, whereas industry itself could not obtain compensating price increases owing to governmental restrictions. The sharp inflationary trend induced these labor upheavals, and they in turn caused commodity price increases, thus producing a price spiral the end of which may not yet be contemplated.

At the time of this writing, the drastic decline of September and October seems to have been arrested, at least for the time being. In fact, price stabilization seems to have been achieved shortly after the November election with its landslide drift to the right. Although many deadlocks seemed inevitable, the general interpretation given to the election results is one of hope for greater conservatism and fairer treatment of business, reduction of the tax burden for both corporations and individuals, general removal of governmental emergency powers, and greater consideration for private enterprise.

INDUSTRIAL SHARE PRICES

The two-fold trend of the 1946 stock market is indicated by the monthly stock averages of the Standard and Poor's barometer figures for various leading groups of stocks. Fifty representative industrial stocks had an average price of 172.8 for January, as compared with an average of 166.7 for December, 1945, and 131.8 for January of 1945. Thereafter the succeeding two months showed a minor decline, the averages for February and March being 173.1 and 167.8, respectively. Following March an increase occurred during April and May, namely, to 179.5 and 179.8, the latter figure being two points above the January average. In June the bear market of the latter half of the year began its course, with the average for that month standing at 177.8. For July the average moved still lower to 173.5, and in August to 170.5. Thereafter the decline was much more violent, namely, to 145.9 for September and 142.9 for October. Between May and October the market in this group experienced a depreciation of 20.5 per cent.

The October average of 142.9, when compared with the January average of 172.8, shows a decline in the average monthly price level of 17.3 per cent. This year's October average of 142.9 compares with 159.7 for October, 1945; 127.1 for October, 1944; 117.3 for October, 1943; and with reference to approximately the same period (November), 95.2 for 1942; 93.8 for 1941; 106.9 for 1940; 123 for 1939; 129.1 for 1938; 107.8 for 1937; 168 for January, 1937, and 53.5 for the yearly average of 1932, the bottom year of the 1930-36 depression. The 1946 decline in this group of 17.3 per cent for the first ten months compares with a rise for the same period of 1945 of 21.1 per cent, and with a rise for the same period of 1944 of slightly over 8.2 per cent. It is interesting to note that in October, 1946, the average of 142.9 is about 2.7 times the 1932 depression yearly average of 53.5.

RAILROAD SHARES

With respect to 20 representative railroad stocks, the monthly price average of the Standard and Poor's barometer figures showed the same trends already explained for the industrial list. For January, 1946, the monthly average stood at 66.7. Thereafter the monthly average declined to 66.3 for February, to 62.7 for March, rose slightly to 63.7 for April, and 63.6 for May. By June the average had again increased to 66.1, or approximately to the January average of 66.7. For the first half of the year, therefore, there was an approximate maintenance of the January price level. Following June, the price declined to 62.8 for July and to 59.9 for August. Following August, however, the bear market in rails became much more drastic, the average monthly price level standing at 48.3 for September and 45.1 for October (latest monthly figure available). The October average of 45.1, when compared with the January average of 66.7, shows a decrease of 32.4 per cent. It compares with 59 for October, 1945; 42.1 for October, 1944; 37.5 for October, 1943; 29.7 for October, 1942; 27.8 for November, 1941; 30.1 for November, 1940; 33.5 for November, 1939; 31.7 for November, 1938; 33.1 for November, 1937; 47 for January, 1936; and with yearly averages of 36 for 1935; 42.9 for 1934; 39 for 1933; and 26.8 for the bottom depression year of 1932. It is interesting to compare the October, 1946 average of 45.1 with the 1932 low June monthly average of 15.0.

PUBLIC UTILITIES

For the public utility group the 1946 average price movement reflects the same trends shown by the other major groups of shares. According to the Standard and Poor's barometer average for 20 representative public utility stocks, the monthly average rose, with minor variations, from 88.5 for January to 94.5 for June, an appreciation of 6.8 per cent. During the intervening months averages stood at 89.5 for February, 88.8 for March, 93.7 for April, and 94.3 for May. Following June there was a decline to 90.2 for July and to 88.4 for August. Following August the bear market in utilities became more intense, the average for September being 75.5 and for October 74.3. The October average of 74.3, when compared with the January average of 88.5, shows a decline in the utility price level of 16 per cent. The October, 1946, average of 74.3 compares with 77.3 for the corresponding month of 1945; 55.9 for October, 1944; 51 for October, 1943; 33.7 for October, 1942; 37.9 for November, 1941; 59.8 for November, 1940; 69.5 for November, 1939; 66.4 for November, 1938; 63.3 for November, 1937; 100.9 for January, 1937; 88.4 for January, 1936; and with yearly averages of 62.8 for 1935; 66.5 for 1934; 81.8 for 1933; and 88.7 for 1932.

COPPER SHARES

For a representative list of seven copper stocks, the average monthly price level for 1946 again shows trends similar to those already noted for the industrial, railroad, and public utility groups. From January to May the average rose gradually, with minor interruptions, from 132.2 to 142.8, or 7.3 per cent. Thereafter a decline occurred to 139.7 for June, 138.8 for July, and 133.9 for August. Following August the decline was very substantial to 109.2 for September and 109.7 for October. The October average of 109.7, when compared with the January average of 132.2, shows a depreciation in this group of 17 per cent. The 1946 October average of 109.7 compares with 110.6 for October, 1945, and with October averages of 82.8 for 1944, 77.4 for 1943, 80.9 for 1942, and 83.4 for 1941.

COMBINED AVERAGES

Combining the stocks used by the Standard and Poor's index for industrials, railroads, and public utilities, the average monthly 1946 price level rose from 143.1 for January to 148.5 for May (3.8 per cent appreciation), then declined to 147.6 for June, 143.4 for July, and to 140.6 for August. Thereafter the decline was very rapid to 119.9 for September and 117.2 for October. The October average of 117.2, when compared with the January average of 143.1, shows a depreciation for the first ten months of the year of 18.1 per cent. This compares with an appreciation of 22.3 per cent for the same period of 1945, and with an appreciation of 8.2 per cent for the same period of 1944. It should also be pointed out that the 1946 October average of 117.2 compares with 131 for the corresponding month of 1945, and with 102.5 for the same month of 1944.

TABLE I

MARKET VALUE OF SHARES

Using the figures of the New York Stock Exchange, the total value of 1,756,181,000 of listed shares on the Exchange stood at $66,114,907,000 at the beginning of November, 1946. This value compares with $69,561,000,000 at the beginning of November, 1945; $53,087,000,000 at the beginning of November, 1944; $45,101,000,000 at the close of November, 1943; and $37,374,000,000 at the close of November, 1942. The 1946 Nov. 1 value of $66,115,000,000 may also be compared with $37,882,000,000 on Dec. 1, 1941; $41,848,000,000 at the same date in 1940; $45,500,000,000 in 1939; $46,081,000,000 in 1938; $40,716,000,000 in 1937; and with $62,618,000,000 for March 1937, the high mark before the bear market of 1937-38 began its course.

MONTHLY STOCK AVERAGES

The average monthly "All Stock Price Index" as furnished by the New York Stock Exchange, stood at 79.3 for Nov. 1, 1946, as compared with 80.2 for Nov. 1, 1945; 69.7 for the corresponding period of 1944; 59.8 for 1943; 50.6 for 1942; 51.6 for 1941; 57 for 1940; 63.2 for 1939; and 64.1 for 1938. The Nov. 1, 1946 average of 79.3 compares with the following Dec. 1 averages for preceding years: 37.8 for 1937; 56.01 for 1936; 45.85 for 1935; 35.59 for 1934; 32.78 for 1933; and 25.61 for 1932.

VOLUME OF STOCK TRANSACTIONS

Stock transactions on the New York Stock Exchange during 1946 showed about the same volume of sales as 1945, namely, 363,709,312 shares as compared with 377,564,000 shares for 1945, 263,074,000 shares for 1944, and 278,742,000 shares for 1943. The current year, as well as 1945, indicates a departure from the comparative stock market stagnation that has prevailed since 1938. During 1946 only June, July, and August showed total transactions below 22,000,000 shares per month. Every other month during the first ten months of the year showed a monthly total in excess of 25,000,000 shares. January and September record the largest totals of 51,510,000 and 43,450,000 shares, respectively. February, April, May, and October exceeded the 30,000,000 share mark. With the exception of July and August, when the daily average of transactions (excluding Saturdays) was 936,000 and 946,000 shares, respectively, the daily average for every month from January to October was well in excess of the million-share total. January and September showed daily averages in excess of 2,000,000 shares. The 1946 total of 363,709,312 shares compares with 377,564,000 shares for 1945; 263,074,000 for 1944; 278,741,000 for 1943; 125,678,000 for 1942; 170,534,000 for 1941; 207,605,000 for 1940; and 1,125,000,000 for 1929, the highest figure on record.

1931	579,921,426	1945	377,563,575
1932	425,235,829	1946	363,709,312
1933	654,874,210		

On the New York Curb market sales during 1946 totaled 137,220,000 shares, as compared with 143,337,000 shares for 1945, 71,062,000 shares for 1944, and 71,382,000 shares for 1943. The 1946 total of 137,220,000 shares also compares with 22,328,000 shares for 1942; 34,691,000 for 1941; 43,000,000 for 1940; and 474,000,000 for 1929, the largest on record.

THE BOND MARKET

Bond sales on the New York Stock Exchange during 1946 indicated a very dull market, the total being $1,364,174,150, as compared with $2,261,985,000 for 1945; $2,694,704,000 for 1944; $3,254,716,000 for 1943; $2,313,000,000 for 1942; $2.114,000,000 for 1941; and $1,672,000,000 for 1940.

During 1946, bonds maintained an unusually high and fairly steady price level throughout the year, although the price trend was downward. Using Moody's Bond Prices as a basis

(*Commercial and Financial Chronicle,* Nov. 28, 1946), the average for domestic corporation bonds stood at 119 at the end of January 1946. By June 26 the average price had declined to 118.6. Thereafter the average price fluctuated narrowly from month to month until the price stood at 116.22 on Nov. 26 (the latest available). This compares with 116.8 for the corresponding date of 1945, 113.12 for 1944, and 110.52 for 1943. It also compares with high and low averages for 1942 of 107.62 and 106.04, with a high and low for 1941 of 108.52 and 105.52, and with high and low for 1940 of 106.74 and 99.04. The Nov. 26, 1946, price is 0.58 points below the price on the corresponding date in 1945. The high and low averages for the year 1946 were 120.22 and 116.22, respectively. United States government bonds stood at the high average level of 121.67 on Nov. 26, 1946, compared with high and low for the year of 126.28 and 120.7, and with high and low for 1945 of 123.79 and 120.55, with 120.4 and 119.2 for 1944, and 119.63 and 113.02 for 1940.

The extraordinarily high price of bonds has brought the average bond yield to very low figures. According to Moody's Bond Yield Average, the average yield for all of the domestic corporation bonds was down to 2.84 per cent on Nov. 26, 1946. However, for choice bonds (the Aaa group) the yield was only 2.60 per cent as compared with 2.61 per cent a year ago, 2.71 per cent in 1944, 2.74 per cent in 1943, 2.82 per cent in 1942 and 2.8 per cent in 1941.

Using the Standard and Poor's barometric averages for a representative group of corporate bonds, the monthly high average stood at 120.2 for January 1946. Thereafter the price fluctuated slightly from month to month, the monthly high average standing at 120.2 for February, 120.3 for March, 120.3 for April, 119.8 for May, 119.8 for June, 119.5 for July, 119.3 for August, 119.1 for September, and 116.2 for October (latest available). The year thus shows a remarkably stable bond market at an unusually high price level, except for the last month (October) when the average price declined by 2.9 points. It should also be noted from the accompanying table that the monthly fluctuation between high and low was very small for the first seven months of the year. September and October, however, showed a range between high and low of as much as 3.3 and 3.4 points, respectively.

COMPOSITE BOND PRICES—1946

	High	Low
January	120.2	119.1
February	120.2	119.9
March	120.3	120.0
April	120.3	119.4
May	119.8	119.4
June	119.8	119.2
July	119.5	118.6
August	119.3	118.6
September	119.1	115.8
October	116.2	114.8
November		
December		

All bonds listed on the New York Stock Exchange (930 issues) showed a total market value of $140,245,280,000 at the beginning of November 1946. This compares with $128,741,461,000 at the corresponding date in 1945, and with $101,801,493,000 on Nov. 1, 1944, $90,969,000,000 on Dec. 1, 1943, $64,544,000,000 on Dec. 1, 1942, $54,813,000,000 in 1941, and $50,755,000,000 in 1940. The substantial increase in the 1946-1943 figures is largely attributable to the issue of large amounts of United States Government securities during those years. On Nov. 1, 1946, the average price of the aforementioned listed bonds stood at 102.46, which compares with 103.16 at the corresponding date of 1945, 100.71 at the same date of 1944, and with 99.02 in 1943, 96.11 in 1942, 94.8 in 1941, 93.58 in 1940, 91.24 in 1939, 90.34 in 1938, and 81.36 in the bottom depression year of 1932.

THE MONEY MARKET

With respect to both time and call loan rates, the 1946 tendencies for the first seven months represent an exact duplication of the situation prevailing during 1945 and the preceding 11 years. As was the case during previous years, in fact as far back as 1933, New York time and call loan rates were quoted at only about 1 per cent or under. Beginning with a January average of 0.75 per cent for four to six months prime commercial paper, and 1 per cent for call loans in New York, the average monthly rate remained fixed at these low figures for the first seven months of the year. During August and September, however, time rates rose to an average of 0.81 per cent, whereas call loan rates during those two months rose from 1 per cent to 1.3 per cent and 1.38 per cent, respectively.

According to the New York Stock Exchange's figures (Nov. 1, 1946), the borrowings of New York Stock Exchange members on collateral security continued to show a very small volume. The total of $371,000,000 for Nov. 1, 1946, compares with $911,000,000 for Nov. 1, 1945, $878,000,000 for 1944, $718,000,000 for 1943, $342,000,000 for 1942, $436,000,000 for 1941, $362,000,000 for 1940, and $4,017,000,000 for 1929.

BANKING AFFAIRS

By Robert W. Bachelor

Director of the Research Council, American Bankers Association

GENERAL

The year 1946 was a year of transition from war finance to the financing of commerce and industry. The beginning of the year brought to completion the Victory Loan which provided the Treasury with unneeded cash balances that equaled $25,000,000,000 in December 1945, and in January and February 1946. These deposits were gradually reduced by retiring the short-term debt held by the banks. In the first quarter of 1946, loans to brokers and others for the purpose of purchasing and carrying United States securities were large, as required to complete the Victory Loan. It required substantial effort on the part of the banks to have these loans reduced during the remainder of the year.

Business and industry began to borrow heavily as soon as Treasury financial requirements were met, and commercial loans expanded during the remainder of the year. This more than offset the reduction in security loans. At the same time, consumer credit and loans on urban real estate and farm lands increased substantially.

Although total deposits of all banks declined as government deposits were reduced, the effective money supply grew slowly but steadily. The so-called "war loan deposits" in banks have few of the characteristics of ordinary deposits of individuals and corporations. In 1946, most of these war loan deposits were never used and never entered into the supply of money. Currency in circulation was almost stabilized at nearly $29,000,000,000, and the monetary gold stock reversed its trend and began to increase instead of decrease.

Federal Reserve bank credit fluctuated between $23,000,000,000 and $24,000,000,000 during 1946. There was a slight increase toward the end of the year, accompanying the increased demand for currency. Money outside the Treasury and Federal Reserve banks approximated $29,000,000,000 at the year-end. Excess reserves of the commercial banking system were maintained just below $1,000,000,000 during most of the year.

LOANS AND INVESTMENTS

Total credit extended by banks at the end of 1946 was somewhat below that outstanding one year earlier as the Treasury retired short-term securities held by the banks by means of cancelling a large part of the $25,000,000,000 of government deposits due from those banks at the beginning of the year.

Total loans of banks increased nearly $3,000,000,000 during the year, and there was a redistribution of borrowing by purpose for which the loan was granted. At the beginning of 1946, the Victory Loan was in progress. Bank loans to brokers and dealers, and to others, for the purpose of purchasing and carrying United States Government securities, were several times larger than a normal figure. The Federal Reserve System advised banks and the public that efforts should be made to reduce the amount of loans for this purpose. At the same time there was a sharply increased demand for consumer loans, real estate loans, and business loans. Many businesses found themselves in need of working capital as interruptions delayed their marketing schedules and as production costs increased. Total loans increased by $3,000,000,000, notwithstanding a liquidation of $2,000,000,000 in security loans.

OWNERSHIP OF DEPOSITS

Demand deposits increased further in 1946, owing largely to increased loans for business purposes and to consumers. Personal deposits (including those of farmers) continued to increase through 1946, while there was little change in the amount of demand deposits owned by businesses. Deposits owned by manufacturing and mining concerns declined somewhat, while amounts held by trade and financial businesses increased but at a slower rate than during previous years. Federal Reserve estimates of ownership of demand deposits, as of July 31, 1946, were:

(Billions of dollars)

Total domestic business	44.9
Corporate	32.8
Unincorporated	12.1
Personal	27.6
Farmers	6.2
Others	21.4
Other (trust funds, foreigners, non-profit ass'ns.)	5.0
Total	77.5

TREASURY OPERATIONS

During the calendar year 1946, cash income and cash outgo of the Treasury were approximately in balance, and there appeared to be a reasonable prospect of keeping them about equal in amount. Under these circumstances, the Treasury began to reduce its deposits with commercial banks by retiring much of the outstanding short-term debt as it matured. Much of this debt was owned by the banks. The results were reduced deposits and reduced holdings of United States securities by the commercial banking system.

Commercial bank holdings of United States Government securities were reduced from $92,500,000,000 at the end of February 1946 (after the Victory Loan campaign was completed), to $78,700,000,000 at the end of September, and fell still further in the final quarter of the year. United States Government deposits at commercial banks declined $17,400,000,000 in the first ten months of 1946. Some of this was shifted to deposits of individuals to the extent that retired debt was held by non-bank investors.

Accompanying the small retirement of the public debt, liquid asset holdings of individuals and businesses made almost no further growth. During the war years, almost the entire increase in the Federal debt held by the public was reflected in increases in currency, demand or time deposits at banks, and United States Government securities, owned by individuals or businesses.

The Treasury launched a campaign to continue the sale of Savings Bonds to the public, and the banks cooperated in this work. It is hoped that new sales will equal redemptions of securities now held by the public.

INTEREST RATES

Open market interest rates rose slightly as gross deposits shrank when Treasury cash income equaled cash outgo and so-called war loan deposits were cancelled and short-term Federal indebtedness reduced. The discount rate of ½ per cent on discounts collateralled by United States Government securities having a maturity of not over one year was withdrawn by most Federal Reserve banks in late April. Rates of interest charged customers by banks continued down at country banks, but increased somewhat at the larger city institutions. Interest rates charged customers on new loans at banks in 19 cities averaged 2.09 per cent in December, 1945, compared with 2.32 per cent for September, 1946. Open market rates on United States Government three to five-year taxable notes were reported at 1.10 per cent in January, 1946 and 1.25 per cent in the final week of November. Stock Exchange call loan renewals which were quoted at 1 per cent during the war years and through July 1946, were advanced in August to 1¼-1½ per cent. Yields on high-grade municipal bonds increased slightly, although yields on high-grade corporates closed the year at about the same level as one year previous.

BANKING OFFICES

During 1946 and 1945 there were no bank failures. The number of banks in operation reached a low of 14,535 on Dec. 31, 1944, and increased from that date to 14,592 on Oct. 31, 1946. The number of banks increased by 39 during the first ten months of 1946, but the number of branches and additional offices decreased by one. There was little growth in branch banking during either 1946 or 1945.

FOREIGN EXCHANGE AND BANKING

In the closing days of 1946 the International Monetary Fund announced parities on currencies of countries that are members of the fund. Most of these official rates were unchanged from earlier in 1946. Effective July 5, the Canadian dollar was adjusted to parity with the United States dollar, from a previous value of 90.9¢. Closing quotations for the year were a few cents below par. Effective July 13, the Swedish krona was adjusted to 3.6¢ to the United States dollar, from a prior value of 4.2 kroner per dollar. This new rate was held throughout the remainder of the year. There was reasonable stability in most of the other currencies that are important in international dealings. The pound sterling rate was stable and the British Government drew upon proceeds of the $3,750,000,000 loan authorized by a special act of Congress approved July 15, 1946.

INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT

The International Bank for Reconstruction and Development was organized, and a staff was assembled. No securities have yet been issued or offered in the markets of any country. Some educational work was undertaken to acquaint bankers and bank supervisory authorities with the merits of prospective issues as investment securities. The State of Wisconsin ruled that obligations of the International Bank were not legal investments for banks organized under its laws.

GOLD AND SILVER

Monetary gold stock of the United States increased $500,000,000 during 1946, reversing the downward trend that prevailed from early 1943 through 1945. Domestic production was augmented by small imports, chiefly from Canada, and by releases from earmark for the account of countries that required dollar balances.

An Act of Congress approved July 31, 1946 authorizes the Secretary of the Treasury to sell or lease silver to industry at not less than 90½¢ per ounce. The seigniorage on silver mined after July 1, 1946 is reduced to 30 per cent, thus assuring a price of 90½¢ per ounce for domestically produced silver.

BANK EARNINGS

Earnings of banks continued satisfactory. Net profits of Federal Reserve member banks after taxes, for the first six months of 1946. were at the annual rate of 11 per cent of capital accounts. This is essentially the same rate earned in 1945.

Reductions of large amounts of short-term low-yielding United States Government securities were offset to some extent by the expansion of loans to customers at substantially higher interest rates. All items of expense increased substantially. Salary and wage payments for the first half of 1946 were 20 per cent greater than for the corresponding period of 1945. Interest rates paid customers on time and savings deposits were advanced by many banks.

DEPOSIT INSURANCE

The financial statement of the Federal Deposit Insurance Corporation dated June 30, 1946 disclosed a capital and surplus of approximately $1,000,000,000. Maple T. Harl, chairman of the Corporation, indicated that this sum was ample to meet any prospective liabilities of the corporation in insuring bank deposits of the nation. He suggested that the present rate of assessment on banks for deposit insurance (1/12 per cent per annum) be continued until the capital funds supplied by the United States Treasury and the Federal Reserve banks were returned without reducing the unobligated capital funds of the corporation below $1,000,000,000. Legislation to accomplish these purposes was introduced into the Congress but failed to receive consideration before the end of the session. The American Bankers Association, for years, has advocated the return of government capital in the Federal Deposit Insurance Corporation.

BANKING LEGISLATION

The increasing volume of government checks issued each year, especially during the war, burdened the banks with liabilities unlimited as to time, as endorsers. Many of these checks were cashed for individuals who had no bank accounts. The United States Treasury, after many years of discussion, finally agreed to the Act of March 6, 1946, that, in effect, gives a six-year statute of limitations on claims by the United States against banks or others who handle a government check that later is found to have a forged or unauthorized endorsement.

FEDERAL RESERVE SYSTEM

Effective Jan. 21, 1946, banks and brokers were forbidden to extend credit on listed securities for the purpose of purchasing or carrying securities. Previous margin requirements had been 75 per cent. Declining stock prices in the last half of 1946 brought no relaxation in margin requirements under Regulations T and U.

Some modification in Regulation W, governing the extension of installment credit, was announced, effective Dec. 1, 1946. The actual effect of this revision was negligible, since there was no relaxation in terms of payment for articles making up the bulk of installment purchases.

The thirty-second annual report of the Board of Governors of the Federal Reserve System, released in mid-1946, recommended for consideration by the Congress "the provision of additional powers which could be used to prevent further unnecessary expansion of bank credit without raising the cost of Treasury financing." The powers requested would empower the Board to limit the amounts of long-term marketable securities, both public and private, that any commercial bank may hold against its net demand deposits. Also the Board would be empowered to require all commercial banks to hold a specified percentage of Treasury bills and certificates as secondary reserves against net demand deposits. These secondary reserves would be in addition to the cash reserves required by present laws and regulations. Federal Reserve spokes-

men have requested even more far-reaching powers that would effectively freeze the public debt into the banking structure under virtually a "one hundred per cent reserve," as that plan was outlined more than a decade ago. President Frank C. Rathje of the American Bankers Association took a strong position against these requests for new powers in his annual report to that Association.

AMERICAN BANKERS ASSOCIATION

The American Bankers Association carried on a vigorous campaign against continued government guarantees and controls. The blanket participation agreement under which the Reconstruction Finance Corporation automatically guarantees loans was criticized severely.

Resolutions passed at the annual convention urged bankers everywhere to continue unremittingly their efforts to sell United States savings bonds. Other resolutions urged a balanced budget, reduced government spending, a system of taxation to encourage individual initiative and private enterprise, and encourage employment. Nationalization of business and industry was opposed. Bankers were urged to keep veterans fully informed of business conditions as they are currently developed.

Officers of the American Bankers Association elected to serve during 1946-47 are: President—C. W. Bailey, president, First National Bank, Clarksville, Tenn.; Vice President—Joseph M. Dodge, president, The Detroit Bank, Detroit 31, Mich.; Treasurer—S. Albert Phillips, vice president, First National Bank, Louisville 1, Ky.; Executive Manager—Harold Stonier, 12 East 36th Street, New York 16.

TRUST BUSINESS

Graduate School of Banking, American Bankers Association

TRUST DIVISION, AMERICAN BANKERS ASSOCIATION

The 1946-1947 organization of the Trust Division of the American Bankers Association is as follows: President, Evans Woollen Jr., president, Fletcher Trust Co., Indianapolis, Ind.; Vice President, R. M. Alton, vice president in charge of trust department, United States National Bank, Portland, Ore.; Chairman of the Executive Committee, H. M. Bardt, vice president and trust officer, Bank of America N. T. & S. A., Los Angeles, Calif.; Secretary, Merle E. Selecman, deputy manager, American Bankers Association; Members of the Executive Committee: Henry A. Theis, vice president, Guaranty Trust Co. of New York; James W. Allison, vice president, Equitable Trust Co., Wilmington, Del.; George C. Barclay, vice president, City Bank Farmers Trust Co., New York; J. M. Hutchinson, vice president and trust officer, Davenport Bank and Trust Co., Davenport, Ia.; Lee P. Miller, vice president, Citizens Fidelity Bank and Trust Co., Louisville, Ky.; John A. Reid, vice president, the First National Bank of Cincinnati; John H. Evans, vice president and trust officer, McDowell National Bank, Sharon, Pa.; N. Baxter Maddox, vice president and trust officer, The First National Bank, Atlanta, Ga.; John W. Remington, vice president and trust officer, Lincoln Rochester Trust Co., Rochester, N. Y.; Leo A. Steinhardt, president, International Trust Co., Denver, Col.; B. Magruder Wingfield, vice president and trust officer, The National Bank of Commerce, Houston, Tex.; Clarence R. Chaney, vice-chairman of the board, Northwestern National Bank, Minneapolis, Minn.; Edwin W. Marvin, vice president, The Hartford-Connecticut Trust Co., Hartford, Conn.; L. L. McArthur Jr., vice president, The Northern Trust Co., Chicago; James M. Trenary, vice president and secretary, United States Trust Co. of New York; Raymond H. Trott, vice president, Rhode Island Hospital Trust Co., Providence, R. I.

TRUST CONFERENCES

During 1946 one nationwide and three regional trust conferences were conducted. The annual Mid-Winter Trust Conference was held in New York, Feb. 4-6, 1946; the Pacific Coast and Rocky Mountain States Regional Trust Conference, in Los Angeles, Aug. 7-9, 1946; and the Mid-Continent Trust Conference, in Chicago, Nov. 7-8, 1946. These conferences were sponsored by the Trust Division of the American Bankers Association. The Corporate Fiduciaries Association of Boston sponsored the Thirteenth New England Trust Conference, held in that city Dec. 6, 1946. In addition to these nationwide and regional conferences, the Trust Research Department of The Graduate School of Banking sponsored and conducted a series of 50 local conferences in Illinois, Indiana, Iowa, Maine, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Wisconsin. These conferences were designed especially for smaller trust departments, completing a series of 67 conferences, 17 of which had been conducted in other states during 1945.

TRUST LEGISLATION

Since only a few state legislatures were in session during 1946, there is comparatively little trust legislation to report. About the only statute of general interest is the Uniform Stock Transfer Act which was adopted by Mississippi. Other statutes of more or less local interest were adopted in Georgia, Kentucky, Mississippi, Missouri, New Jersey, New York, South Carolina, and Virginia.

In the field of trust legislation the most remarkable development has been the amount of more or less uniform trust legislation which was adopted even during the stress and strain of the war years. The following table shows the number of such statutes adopted before 1938 and the number adopted since 1938.

Legislation	Before 1938	Since 1938
Prudent Man Rule for Trust Investment	7	8
Common Trust Fund Acts	6	20
Uniform Trustees' Accounting Act	1	3
Uniform Fiduciaries Act, or Sec. 3	13	12
Nominee-Registration Acts	4	17
Uniform Principal and Income Act	1	13
Uniform Trusts Act	0	6
	32	79

SMALL ESTATES AND SMALL TRUSTS

In the section on Trust Business in THE AMERICAN YEAR BOOK, 1945 (p. 439) mention was made of the unusual number of small estates going through probate and of the attitude of trust institutions toward the acceptance of small estates.

During the year a committee of the Section of Real Property, Probate, and Trust Law of the American Bar Association drafted and published a Model Probate Code, eight sections of which are designed to streamline the settlement of small estates, suggesting one procedure for the settlement of estates under $1,000 and another, somewhat more formal but still simple, procedure for the settlement of estates under $2,500.

A survey as of November 1946 of over 200 trust institutions—small, medium, and large—representing every section of the country reveals that 37 per cent of these institutions set no limit upon the size of the estate they will accept, depending on the circumstances. In addition to these, 21 per cent state they will accept estates as small as $1,000. Out of this group of trust institutions over half state that they actually are seeking or desiring estates of $10,000 and under. As regards trusts, three-fourths of them accept trusts of $10,000 or under and about one-fourth are seeking trusts of $10,000 or under. Of this group of trust institutions, one-fourth are advertising for small estates and small trusts, 10 of which indicate by the advertisements that they accept estates of $1,000 and under. All of which goes to show that trust institutions now are accepting and even seeking small estates and small trusts just as banks are seeking and making small personal loans. The trends toward the acceptance of small estates and small trusts and toward the seeking and making of small loans are of a piece in that they indicate the further democratization of both banking and trust business.

TRUST COMPENSATION

One of the most notable developments in the trust field during 1946 was the progress toward putting trust service on a pay-as-you-go basis. Distinct impetus to this movement was, no doubt, given by the placing of Federal income taxes on a pay-as-you-go basis. Be that as it may, trust institutions in different parts of the country are engaged now in putting their trusts under will and living trusts and, with the approval of the court, guardianships on a pay-as-you-go basis even if their estates always have been on that basis. They are accomplishing this by fixing annual rates in the light of the cost of the service and of the responsibility assumed; by eliminating or greatly reducing the opening and closing charges; by making the principal bear a substantial part of the annual charges of administering the account; and by having the boards of directors of the respective institutions adopt schedules of rates for usual services and make provision for additional compensation for extraordinary service. The following schedule of rates for living trusts recently adopted by one of the larger trust institutions is perhaps typical:

Schedule A. Annual Income Commission

Amount of Income	Annual Commission
$ 0–$ 5,000	5% on income
5,000– 12,500	$ 50.00 plus 4% on income
12,500– 25,000	175.00 plus 3% on income
25,000– 50,000	300.00 plus 2½% on income
50,000 up	550.00 plus 2% on income

Schedule B. Annual Principal Commission

Fair Value of Principal	Annual Commission
$ 0–$ 25,000	4/10% on principal
25,000– 50,000	$ 25.00 plus 3/10% on principal
50,000– 100,000	75.00 plus 2/10% on principal
100,000– 200,000	175.00 plus 1/10% on principal
200,000 up	275.00 plus 1/20% on principal

Combined minimum annual charge, $25

Additional annual charges on mortgages and real estate are specified. Examples of unusual or extraordinary services include: managing or liquidating closely held businesses or tracts or parcels of real estate; handling contested or litigated matters; making special apportionments between principal and income; remitting on other than regularly scheduled dates; preparing on special request lists of investments showing market value and estimated annual income; performing especially difficult or responsible tax services; making distributions to unnamed distributees, such as next of kin.

FOREIGN EXCHANGE

By Marcus Nadler
Graduate School of Business Administration, New York University

---

QUESTIONS OF CURRENCY REVALUATION

The year 1946 was one of transition in the foreign exchange market. It was marked by the establishment of the Bretton Woods financial institutions, the devaluation of the French franc, the upward revaluation of the Canadian dollar and the Swedish krona, intensified inflation in a number of countries and otherwise by relative stability of the official exchanges.

It is generally known that a number of currencies are over-valued. Nevertheless, practically all countries belonging to the International Monetary Fund have notified the latter that the parity of their exchanges will be the same as it was throughout the greater part of 1946. This policy can easily be explained. So long as most countries are primarily in need of imports and have relatively few commodities at their disposal for export, it is to their advantage to maintain their currencies at a rate whereby the internal purchasing power is lower than the external purchasing power. Furthermore, many nations fear that to devalue their currency at the present time, when the supply of commodities available for consumption is still limited, would merely accentuate the process of inflation without bringing any satisfactory results. The various governments have, therefore, postponed the definite stabilization of their currencies until the dangers of inflation have diminished, the supply of commodities has increased and the sellers' markets are being converted into buyers' markets. By that time exports will be of much greater importance, and a downward revaluation of the currency will not exercise the same adverse influence as would be the case at the present time.

EFFECT OF U. S. PRICES ON FOREIGN CURRENCY PROBLEMS

The currency policies of a number of countries also were determined to a large extent by the movement of prices in the United States. This country exercises a great influence on the economies of the world and any important change in prices of commodities here is bound to have a considerable effect on the exchanges of other countries. This was demonstrated quite clearly during the summer of 1946 when Canada and Sweden both appreciated their currencies. The official rate of the Canadian dollar was returned to par and that of the Swedish krona was increased by a little over 14 per cent. The action of both countries was motivated by the fear that prices of commodities in the United States would increase very sharply after decontrol. In order to protect their own price level from the increases they expected in the United States they raised the international value of their own exchanges in terms of the dollar, thereby reducing in terms of their own money the cost of commodities imported from the United States.

Shortly after the repeal of price controls, prices in the United States did rise materially. However, toward the end of the year, a declining tendency became evident in many lines and the opinion was often expressed that commodity prices in the United States had already reached their peak or will in the very near future and that thereafter they will decline. Should commodity prices in the United States decline materially during 1947, that fact is bound to have an effect on the exchange rates of most currencies. In that case a general devaluation of a number of currencies may be expected. If, on the other hand, a spiral between wages and prices should develop in this country and commodity prices should continue to rise, it is fairly certain that a number of other countries will follow the example of Sweden and Canada, *i. e.,* they will raise the value of their currencies in terms of the dollar in order to prevent commodity prices in their countries from following the trend in the United States. The uncertain price outlook in the United States was, therefore, another determining factor in the policies of a number of governments to maintain the present rates of exchange of their currencies.

THE PROCESS OF INFLATION

Official rates of exchange do not actually indicate their true value. This is better expressed in the black markets where prices of commodities are much higher than those officially controlled and where the quotation of the United States dollar is substantially higher than the quoted official rate. In a number of countries throughout the world, black markets in the American dollar exist. The price of the dollar is three or four times higher than the official rate. In part this high quotation for the American currency is attributable to the desire of a number of individuals to protect themselves against the ravages of inflation and the certainty of future devaluation. In part, it reflects the shortage of commodities. To some extent, it also reflects the highly uncertain political conditions which prevail in many parts of the world.

The principal reason for the constant increase of the dollar in the black markets, however, and the constant rise in prices of commodities in these markets, is the inability of some governments to balance their budgets. So long as governments continue to create purchasing power in the form of currency or of deposits in order to meet their budget deficits, there can be no return to confidence. Once the government takes definite measures to wipe out its deficit and to suppress its black markets, however, its currency witnesses a considerable improvement. This, for example, was the case during 1946 in Czechoslovakia, Holland, and Belgium, as well as Hungary, and because of the various and drastic measures taken by the respective governments, confidence in the currency has been restored and black markets in dollar exchange have practically disappeared. On the other hand, in countries where no such measures were taken and where the supply of purchasing power continue to increase, the black markets flourish and the dollar continues to mount. This applies, for example, to France, Italy, China, and several other countries.

One of the problems that confronts the world at large is the restoration of sound currency conditions in the principal defeated enemy countries. notably Germany and Japan. The German mark, for all practical purposes, is used only to buy rationed commodities and for the payment of salaries and wages. Most other transactions are carried out on a barter basis, with the American cigarette the general standard of value. Conditions are confused because of the lack of a central government and because the assets of the banks still consist to a very large extent of government obligations on which no interest is being paid. While conditions in Japan are better, inflation is still rampant, and the purchasing power of the yen is rapidly decreasing.

THE BRETTON WOODS INSTITUTIONS

Although the organizations and the assembly of a competent staff of the International Bank for Reconstruction and Development as well as that of the International Monetary Fund were completed during 1946, they have not started operation. So far as the Bank is concerned there are reasons to believe that loans will be made during the first half of 1947 The Bank must of necessity adopt a very cautious policy in the extension of loans and will first have to establish a market for its securities in the leading countries of the world, notably the United States. It is fairly certain, however, that if the obligations, direct or guaranteed, of the International Bank are properly priced and have not too long a maturity, a ready market for them will be found in the United States. The activities of the International Monetary Fund will not be as complex as was originally thought, primarily because the supply of dollars throughout the world has increased materially owing to a large extent to loans granted by the United States Government directly or indirectly through the Export-Import Bank. The greatest difficulty will arise with those countries, particularly in eastern Europe and in the Far East, which have not received any loans from the United States and where the demand for dollars as well as other rare foreign exchanges will be substantial. Notwithstanding these difficulties, however, the International Monetary Fund will play an important role in the gradual stabilization of currencies and in the elimination of foreign exchange restrictions.

EASING OF FOREIGN EXCHANGE RESTRICTIONS

Foreign exchange restrictions were in force in many countries throughout 1946. Toward the end of the year, however, cumulative evidence appeared of a general desire throughout the world to reduce these restrictions as far as possible in order to restore a freer international flow of credit and commodities. In the United States the release of frozen assets proceeded at a very rapid rate. In the last agreement concluded between the United States and Great Britain it was stipulated that the British Government agree to free all international transactions arising out of current transactions and some steps have already been taken by the Bank of England to loosen the firm grip on the sterling area. It is quite certain, however, that considerable time will have to elapse before the international financial position of the countries is on a sounder basis than at present and before exchange transactions again become free, even if one excludes capital transactions.

THE MOVEMENT OF GOLD

The movement of gold was not so pronounced during the past year, although the United States on balance accumulated gold. In part this was owing to the large volume of loans made by the United States Government to a number of countries, which furnished them with the necessary dollar exchange. In part it was owing to the fact that the volume of international trade is still restricted primarily because of shortages of commodities which prevail all over the world. It is expected, however, the flow of gold to the United States during 1947, particularly from gold-producing countries, will increase.

THE OUTLOOK

If 1946 was a year of transition, 1947 will be a year of decision in the foreign exchange markets. In all probability a number of currencies will be revalued during the year and placed on a more permanent basis. It is fairly certain, however, that in the future the external stability of an exchange will not play the same role as in the past and that considerable fluctuations may be expected in the future. As is well known, members of the International Monetary Fund may change the value of their currencies by 10 per cent without the consent of the Board of Directors of the Monetary Fund. Any further changes need approval of the Fund. There is no question that the approval will be granted wherever necessary since it is quite evident that the international balance of payments of many countries is out of gear and that the currencies of many countries are highly over-valued.

The principal question that arises in this connection is what the future of the pound sterling will be, because it is still the key currency for a number of countries. The attitude of the British monetary authorities will depend to a large extent upon the movement of commodity prices in the United States and on the competitive position of Great Britain.

During the year 1947 the Bretton Woods institutions will definitely begin to operate. It will, therefore, become clear under what conditions the International Bank is willing to extend loans and to what extent the operations of the International Monetary Fund will facilitate currency stability and lead to a gradual removal of foreign exchange restrictions. While exchange restrictions will be removed in some countries, particularly on current transactions, yet there are no reasons to believe that the exchange markets will become free.

Finally, the international exchange markets will to a large extent depend upon the international political situation. If the various difficulties that have arisen among the major powers of the world are ironed out and if a sound treaty of peace is concluded with Germany, the danger of war will definitely have been eliminated and a process of disarmament will set in. This is bound to have a favorable effect on the budgets of many countries and will undoubtedly be a powerful factor in the fight against the forces of inflation. Stable political conditions will soon lead to revival of the international flow of capital from country to country, and this in itself will have a favorable effect on the international stability of exchange rates.

FOREIGN TRADE

By Grace A. Witherow
International Trade Unit, Department of Commerce

EXPANSION IN TRADE

The value of United States exports showed a negligible decline in 1946 as compared with 1945 but exports increased 19 per cent. If strictly military equipment is excluded from the trade of 1945 and, for purposes of comparison, considered only as non-

TABLE 1

1945	9,803	3,759	38.3	4,136	+5,667	−377
1946	9,742	7,965	81.8	4,935	+4,807	+3,030
Semiannual:						
July–Dec., 1945	3,972	2,120	53.3	2,014	+1,958	+106
Jan–June, 1946	4,770	3,505	73.5	2,286	+2,483	+1,218
July–Dec., 1946	4,972	4,460	89.7	2,649	+2,324	+1,812

* Includes re-exports.

[1] Includes purchases made on "cash" or "credit" terms by government purchasing missions and private traders, and also a small amount of shipments by and for the account of, or consigned to, United States Government agencies and establishments abroad. The latter were valued at $15,000,000 in period July-December 1945 and $164,000,000 in year 1946. Private commercial shipments are not available separately.

military items, exports in 1946 increased 23 per cent while imports advanced by 24 per cent.

Commercial exports and supplies shipped by UNRRA and private relief agencies began to increase during 1945, and these goods showed marked expansion in 1946. The gains in these were large enough almost to counterbalance the entire decline after V-J Day in military and other lend-lease supplies which formed a substantial item of trade in the earlier months of 1945. Total exports, therefore, recorded a value of $9,743,000,000 in 1946, as compared with $9,803,000,000 in 1945, a figure representing the highest annual value recorded in any nonwar year.

Imports also showing a disappearance of war trade which partly counterbalanced the increases shown by many other items in 1946, rose from $4,136,000,000 in 1945 to $4,935,000,000. This was the highest annual dollar amount shown for imports in any year except 1920, when the value of incoming goods rose to $5,278,000,000.

Trade with practically all leading countries showed increases in 1946, although the resumption of trade with Europe and the Far East and further expansion in American trade largely accounted for the advance in both exports and imports.

PRICE AND QUANTITY

Prices of commodities in both export and import trade showed a considerable advance in 1946. The unit value of non-lend-lease exports alone, which showed less rise in price during the period of the war than did leading commodities in the lend-lease trade, rose by 10 per cent over 1945 level. As commodity composition shifted in the final quarter of 1945 from a predominance of lend-lease goods to articles of cash-trade, the unit value of total exports dropped to approximately the level of cash trade. Because of the shift in composition the unit value of total exports, therefore, showed a decrease as compared with 1945, although recording an advance of 59 per cent over 1936-38 level.

Imports showed an increase of 12 per cent in unit value over 1945 and of 73 per cent over 1936-38.

In terms of quantity, total exports for 1946 recorded an increase of 4 per cent over 1945 and 105 per cent over the average level of 1936-38. The 1946 total represented the largest volume recorded for a non-war year; it was also larger than the trade in each of the war years except for the high years of lend-lease shipments in 1943 and 1944.

Imports showed an increase of 6 per cent over the 1945 volume and 13 per cent over the prewar 1936-38 average. The 1946 total represented a larger annual volume than for any year except 1941, and it closely approached the high level of that year when trade included unusually large amounts of crude materials.

TABLE 2

INDEXES OF CHANGES IN QUANTITY, UNIT VALUE, AND VALUE OF UNITED STATES EXPORTS AND IMPORTS

Yearly Average and Year	Quantity	Unit Value	Value
Total exports of United States merchandise:[1]			
1936–38	100	100	100
1939–41	135	102	138
1942–44	269	148	399
1945	197	167	328
1946	205	159[2]	325
Non-lend-lease exports:			
1936–38	100	100	100
1939–41	127	102	129
1942–44	71	135	96
1945	96	144[3]	138
1946	191	159[4]	303
Imports for consumption:			
1936–38	100	100	100
1939–41	104	105	109
1942–44	97	140	136
1945	107	155	166
1946	113	173[2]	196

[1] Includes lend-lease exports from 1941 to 1946 inclusive.

[2] December estimated.

[3] Partly estimated.

[4] Same as for total exports; no separate calculation made.

COMMERCIAL OR CASH-PURCHASE EXPORTS

Commercial, or cash-purchase, exports valued at $7,965,000,000 were a predominant part of total United States exports in 1946. Including purchases made by government purchasing missions and private traders on both "cash" and "credit" terms, they formed 82 per cent of total exports, an increase from 38 per cent in 1945. The cash-purchase trade showed considerable expansion during the year, rising from $3,505,000,000 in the six months January-June to $4,460,000,000 in the period from July-December. This gain was made possible in part by the extension of credit to countries having inadequate financial resources for the purchase of goods.

UNRRA SHIPMENTS

The United Nations Relief and Rehabilitation Administration exported $1,015,000,000 worth of merchandise in 1946, comprising 10 per cent of total United States exports. This compares with a total of $355,000,000 in 1945. The agency began operations in March 1944 and made substantial shipments of United States products to foreign countries beginning in the second quarter of 1945. From the first appearance of UNRRA shipments in trade statistics in September 1944 through December 1946, they totaled a sum of $1,368,000,000. Fifty-eight per cent of such supplies went to central and eastern Europe, 12 per cent to the USSR, and 11 per cent to China. Foodstuffs formed 64 per cent of total UNRRA shipments of United States merchandise during the September 1944-December 1946 period, raw cotton, 8 per cent, textiles and wearing apparel, including shoes, 6 per cent, and other commodities 22 per cent. Tables 3 and 4 present the value of UNRRA shipments in 1945 and 1946 by areas and leading commodities.

PRIVATE RELIEF

Shipments by the Red Cross and other private relief agencies, also included in the trade statistics, amounted to $108,000,000 in 1946 as compared with $126,000,000 in 1945. These trade statistics, however, exclude parcels of relatively small value sent by individuals which showed marked increase in 1946. Non-commercial parcel post shipments to Europe and the Far East increased from $30,000,000 (estimate based on samplings of parcel post records by the Department of Commerce) in 1945 to $125,000,000. Thus, on the assumption that all of these parcels represented relief supplies, the total of "private relief" shipments reached $156,000,000 in 1945 and $233,000,000 in 1946. The aggregate of $389,000,000 for the two years 1945 and 1946 was about 30 per cent as large a value as UNRRA shipments during the same period.

TABLE 3

RELIEF AND REHABILITATION SHIPMENTS BY ECONOMIC CLASS AND LEADING COMMODITY

(Value in millions and tenths of millions of dollars)

(x) Less than $500,000.

[1] Includes reexports.

[2] UNRRA shipments began in September 1944 but totaled only $609,000 through the end of the year.

[3] Includes Sweden, Norway, Denmark, Netherlands, Belgium, France, Germany, Austria, Switzerland, Spain, Portugal and Italy; UNRRA shipments went mainly to Austria and Italy.

[4] Includes Czechoslovakia, Hungary, Finland, Estonia, Latvia, Lithuania, Poland, Yugoslavia, Albania, Greece, Rumania and Bulgaria.

LEND-LEASE SUPPLIES

Although the lend-lease program officially terminated at the close of the war agreements were reached with many of the recipients of this aid to permit goods already arranged for to move forward on a loan basis. Trade statistics, therefore, class goods valued at $654,000,000 about 7 per cent of total exports, as lend-lease shipments in 1946. Consisting largely of foodstuffs, textile fibers and manufactures, coal and machinery, they went primarily to Continental Europe, the USSR and the United Kingdom, as indicated in Tables 5 and 6.

COMPOSITION OF EXPORTS

Manufactured articles other than military equipment formed the largest export group in 1946 as they regularly did during many years before the war. The group as shown in Table 7 advanced from an average of $1,378,000.000 in 1936-38 to $4,341,000,000 (military items omitted) in 1945 and $4,944,000,000 in 1946. This 1946 total was the highest recorded for any year except 1944 when lend-lease shipments of heavy steel, motor trucks, and other items not classed as military but having many wartime uses, were unusually large. The group comprised 52 per cent of total exports as compared with 47 per cent in 1936-38 and 45 per cent in 1945.

Military items disappeared from the trade almost completely in 1946 but they had expanded to a higher value than manufactures of other items in 1943 and 1944. In 1944, the peak year of these shipments, total exports of finished manufactures including military equipment amounted to $11,146,000.000 or 76 per cent of total exports.

Foodstuffs more than any other group except implements of war showed marked expansion during the war years and, in response to "relief" demands, it recorded a further advance in 1946. Exports of foodstuffs valued at $2,172,000,000 in 1946 amounted to approximately seven times pre-war shipments. They formed 23 per cent of total exports in 1946 as compared with 17 per cent in 1945, 12 to 13 per cent in the years 1942 through 1944 and 10 per cent before the war.

Exports of crude materials marked the outstanding increase in 1946 with a gain that raised their value from $875,000,000 in 1945 to $1,415,000,000 and their share from 9 per cent to 15 per cent of total exports. Since this group had shown a sharp decline in

(x) Less than one-tenth of one per cent.

the early years of the war and had not regained pre-war value until 1945, it represented in 1946 only about two-thirds the proportion it had formed of total exports in 1936-38.

LEADING COMMODITY EXPORTS

Among leading commodity exports shown in Table 9, machinery valued at $1,367,000,000 in 1946 ranked first in importance. Including industrial machinery, electrical apparatus, agricultural implements and office machines, this item formed three-tenths of the exports of finished manufactures in 1946. It showed an increase of 15 per cent as compared with 1945, mainly owing to larger shipments of industrial machinery. Resumption of trade in passenger automobiles which increased to nearly 117,000 cars valued at $122,000,000 in 1946 also accounted in part for the increase in the manufactured group. Textile fabrics and manufactures valued at $732,000,000, and chemicals and related products at $490,000,000 showed further marked increase over the high levels of the preceding war years. Non-ferrous metals and heavy iron and steel dropped slightly lower than in the immediately preceding year, and petroleum products fell off sharply, but each of these still showed a much larger value than before the war.

Among foodstuffs exports, meats and edible fats attained a total of 1,795,687,000 pounds, valued at $434,000,000. They showed an increase of 8 per cent over shipments in 1945 but a 36 per cent smaller quantity than during the peak wartime movement of these products in 1943 and 1944.

Dairy products similarly showed expansion over 1945 shipments and were also larger than in 1943 and 1944. Grain and flour movements which had showed only moderate gain up to 1944 recorded extraordinary expansion in 1945 and again in 1946 with European, Far Eastern and North African countries the main destinations. Relatively large amounts also of sugar went to Europe and North Africa.

Among crude materials, exports of unmanufactured cotton amounting to 1,999,000,000 pounds valued at $535,000,000 were 56 per cent larger in quantity than in 1945, although still 30 per cent smaller than the annual average for 1936-38. Principal destinations for cotton in 1946 included China, France, Italy and Japan; shipments to the United Kingdom which ranked as the second largest market in 1945 showed a decline of 44 per cent. Coal exports, supplied in substantial tonnage to Europe and also in slightly increased amounts to Canada, rose to 42,605,000 tons valued at $302,000,000, a volume greatly in excess of the usual prewar shipments. Coal exports in 1946 were about 3,391,000 tons larger than in 1920, the year of greatest shipments following the First World War. Exports of unmanufactured tobacco, amounting to 663,000,000 pounds valued at $352,000,000, increased by 40 per cent in quantity over 1945 and 48 per cent over the average for 1936-38; they went largely to the United Kingdom, Continental Europe and the Far East.

WORLD DISTRIBUTION—EASTERN HEMISPHERE

The Continent of Europe stood out as the main destination of United States exports in 1946. Including substantial amounts of foodstuffs and other supplies for reconstruction purchased by Western countries as well as large UNRRA shipments to Central and Eastern Europe, total exports to Europe, excluding the USSR, increased from $602,000,000 in 1944 to $1,448,000,000 in 1945 and $2,853,000,000 in 1946. Commercial, or cash-purchase exports, going mainly to the Western European countries, and comprising three-fifths of total exports in 1946, were far larger than the annual average for exports to the Western countries in pre-war years including the large trade with Germany. UNRRA shipments to Central and Eastern Europe, Table 4, far exceeded the small pre-war trade with that part of the Continent.

The European trade included some Lend-Lease merchandise sent mainly to Belgium, Netherlands and France in 1946. These goods formed 11 per cent of exports to Europe for the year, but showing a decline, amounted to less than 1 per cent of total exports in the final quarter.

Exports to the United Kingdom and the USSR, which ranked first and second as destinations in the years of large lend-lease aid, showed marked decline in 1946. Increases in cash-trading were not large enough to counterbalance the decreased shipments of lend-lease goods. Exports to the United Kingdom dropped off by 61 per cent to $855,000,000, and those to the USSR showed a decline of 80 per cent to $358,000,000. Both figures were, however, considerably larger than the annual average value of exports to these countries in 1936-38.

Exports to the Far East, an area consisting of all Southern and Eastern Asia and Oceania, increased by 22 per cent from 1945 to $1,328,000,000 in 1946, a total representing almost two and a half times the 1936-38 value. Commercial shipments formed 85 per cent of the trade and UNRRA shipments, sent mainly to China, were 8 per cent. Lend-lease supplies declined from 78 per cent, which they had formed of shipments to the area in 1945 to 4 per cent of total exports in 1946.

Exports to Africa and the Near East valued at $619,000,000 in 1946, a slightly smaller total than in 1945, included mainly commercial goods. Although this represented a marked reduction from the years when the trade included large amounts of lend-lease supplies, the 1946 total showed an increase of nearly 4 times over the average value in 1936-38.

WORLD DISTRIBUTION—WESTERN HEMISPHERE

Exports to the American Republics which averaged slightly less than half a million dollars in 1936-38 rose to slightly more than $2,000,000,000 in 1946. The American trade showed marked expansion during the period 1939-1941, after European sources of supply were cut off, and although it

dropped somewhat in 1942 as a reflection of controls placed over United States export supplies and shortages in shipping facilities, it continued to advance each year thereafter. It rose from $1,263,000,000 in 1945 to $2,100,000,000 in 1946 partly because of the return to the trade of passenger automobiles, rubber tires, electric refrigerators and other exports which had largely disappeared during the war years. Moreover, exports of heavy steel, industrial machinery, motor trucks, textiles and chemical products, which the United States had supplied in relatively large volume during the war showed further marked gains.

Exports to Canada valued at $1,442,000,000 increased by 22 per cent over 1945 and 220 per cent over the 1936-38 annual average. Trade in a wide range of commodities expanded in 1946, raising the total to almost the same high level as in 1943 and 1944 before the termination of the large trade in essential war supplies. Manufactured articles, including passenger automobiles, motor trucks, agricultural implements, and such scarce wartime items as electrical appliances and toys showed marked gains. Coal and petroleum products also showed increases. In 1946, as usual, Canada ranked first among individual countries as an export market for United States products.

IMPORT TRENDS

The import trade showed greater expansion in crude materials in 1946 than in any other group. Including substantial amounts of Far Eastern rubber and silk, the group rose from an average value of $1.052,000 000 in 1942-44 and $1,164.000,000 in 1945 to $1,725.000,000 in 1946. It advanced from 31 per cent in the prewar 1936-38 trade to 36 per cent of total imports in 1946, although this proportion was somewhat smaller than in 1940, 1941 and 1942 the years in which the United States accumulated large stocks of strategic materials.

Imports of foodstuffs valued at $1,317,000.000 in 1946 advanced by 14 per cent over the preceding year to nearly as large a value as in 1944. Grain and alcoholic spirits imported in unusually large volume in that earlier year declined sharply in 1945 and showed further reduction in 1946. The increase in 1946 was largely due to trade resuming with Europe and larger imports of coffee from the American Republics at higher prices.

Imports of finished manufactures also reflected the resumption of trade with areas which were inaccessible during the war. This group rose to a value of $845,000,000 or double the value shown in the earlier years of the war. The resuming trade in textiles, jewelry and glassware from several countries on the Continent of Europe, expansion in worsteds and pottery from the United Kingdom, and a slight increase in imports of watches from Switzerland accounted mainly for the advance in the group during 1946.

Imports of semimanufactures remained at the 1945 level and totaled $926,000.000 in 1946. This group had shown marked expansion during the war years primarily as a reflection of the large imports of metals, which dropped in 1946 to half the value recorded in 1945. Imports of paper materials, lumber, and vegetable oils showed moderate increases and those of cut diamonds doubled to counterbalance the marked drop in metals.

LEADING IMPORT COMMODITIES

Table 10 shows the value of leading commodities in each economic class of imports in 1936-38, 1945 and 1946. Among crude materials, raw silk imported in only small amounts from early 1942 through 1945 rose to 13,000 000 pounds in 1946, or 23 per cent of the average imports in 1936-38. Imports of crude rubber amounting to 840,000,000 pounds, an increase of 170 per cent over 1945, represented three-fourths of the pre-war 1936-38 average quantity. Imports of unmanufactured wool which showed marked expansion during the early years of the war reached 1,062,000,000 pounds in 1946, nearly five times the 1936-38 average imports. Advances in price contributed to the rise in value of these commodities, particularly for silk and rubber.

Coffee, the leading foodstuff imported, totaled 2.871.000,000 pounds, an increase of 6 per cent over 1945 and 59 per cent over the pre-war average. The rise in price from an average unit value of 7 cents in 1936-38 to 13 cents in 1945 and 16 cents in 1946, contributed greatly to the advance in the value of coffee. Imports of sugar, amounting to 5,252.000,000 pounds, were 80 per cent of the quantity in 1945 and 86 per cent of the pre-war volume. Prices showed moderate advances, thus accounting for the rise in value of sugar.

Among semimanufactured imports, metals stand out as leading commodity. Imports of copper and aluminum supplied by Western Hemisphere countries which showed marked expansion during the war years, dropped off very substantially in 1946. Copper imports, amounting to $78,000.000, were less than half as large as in 1945. On the other hand, imports of tin bars, which were relatively small from 1942 through 1945 showed a marked in-

---

* Exports of United States merchandise.

[1] Includes corn, oats, barley, rye and grain sorghums.

[2] Including semimanufactures.

[3] Includes electrical apparatus, industrial machinery, office appliances, printing machinery, and agricultural machinery and implements.

[4] Includes value of civilian aircraft as follows: 1945, $9,200,000; 1946, $64,000,000.

[5] Includes finished products, and yarns and other semimanufactures.

[6] Nonferrous, except precious metals and manufactures.

[7] Includes aircraft parts and accessories valued at $50,000,000; watercraft except naval valued at $3,600,000; ordnance combat vehicles valued at $2,900,000; explosives valued at $4,700,000; miscellaneous military equipment valued at $800,000; firearms, ammunition and pyrotechnics valued at $11,600,000.

n.s.s. Not shown separately.

(x) Less than $500,000.

[1] Including those used in the manufacture of iron and steel.

[2] Includes wheat, corn, oats, rye, and barley.

[3] Including those used in the manufacture of iron and steel; also a small value of finished products.

[4] Excluding cabinet woods.

[5] Including clockwork mechanisms and parts.

[6] Includes electrical, industrial and agricultural machinery.

[7] Includes aircraft, explosives, firearms, and miscellaneous military equipment and supplies.

[8] Quantity shown represents newsprint.

crease in 1946, as Far Eastern areas again began to make supplies available.

Linens, worsteds, articles of leather and other European manufactures not obtainable during the war showed, relatively, the largest increases among manufactured articles in 1946. The value of these items ranging from $30,000,000 to $33,000,000 remained much smaller, however, than paper and burlaps, the leading United States imports of manufactured articles. These two commodities increased by 61 per cent to $254,000,000 and 18 per cent to $77,000,000, respectively, in 1946 or to more than double pre-war values. Clocks and watches, which expanded greatly in the immediately preceding years, showed a slight increase over 1945, to $65,000,000.

SOURCES OF IMPORTS—EASTERN HEMISPHERE

Arrivals from the liberated areas in 1946 supplemented the considerable volume of goods continuing to arrive from India, Australia, and other wartime accessible areas of the Far East. Trade from British Malaya, Japan, the Republic of the Philippines, and China increased very substantially in 1946, thus raising total imports from the Far East to $906,000,000 or 114 per cent higher than in 1945. Advancing from 9 per cent in 1944 to 18 per cent, they formed about three-fifths as large a proportion of United States imports as in 1936-38. Imports of tin and many other commodities from the Far East in 1946 still remained below prewar levels and the large amounts of sugar formerly supplied by the Philippines continued to be missing from the trade.

Imports showing advances from wartime inaccessible European countries also included commodities important in pre-war trade, namely, cut diamonds and textile manufactures from Belgium, brandies, liqueurs, textile manufactures and perfumery from France, raw silk, edible nuts and wines from Italy, bulbs and seeds from the Netherlands, precious stones and jewelry from Czechoslovakia, and steel from Sweden. Increasing to $535,000,000 total imports from the Continent of Europe, excluding the USSR, formed 11 per cent of total United States imports in 1946, or slightly more than half the pre-war share. Only 2 to 4 per cent of United States imports came from that area during the years from 1941 through 1944.

Imports from the American Republics, which area became the chief source of foreign merchandise in 1942 and showed steady growth each year thereafter, rose to $1,760,000,000 in 1946. These goods formed 36 per cent of the United States imports in 1946 as compared with approximately 40 per cent in the three years immediately preceding and 22 per cent before the war.

Canada was the only leading country from which imports decreased in 1946. Primarily because of the termination of war trade and the decline in imports of aluminum, both of which were relatively large in 1945, the total trade from Canada showed a decrease from $1,128,000,000 in 1945 to $883,000,000 in 1946. Imports of some commodities from Canada including the large trade in lumber, pulp and paper showed increases in 1946, but the gain for these was not large enough to counterbalance the decline in metals and military items.

BALANCE OF MERCHANDISE TRADE

The large excess of merchandise exports over merchandise imports in United States trade in 1946 developed as a result of the greater availability of supplies in this country than in most other areas of the world. While the United States furnished large quantities of foodstuffs and other goods for reconstruction in war devastated areas, and also manufactured articles to meet the demands which were largely unmet during the war years, many other areas were not in a position fully to meet United States requirements for numerous commodities. The large excess of exports over imports was financed by the extension of credits and by the drawing down of dollar balances.

Exports are expected to increase

somewhat in 1947, and although imports may expand at a more rapid rate as production in other countries accelerates, the export balance will, no doubt, continue to be of considerable magnitude.

FOREIGN TRADE POLICIES*

By HENRY CHALMERS
CONSULTANT ON COMMERCIAL POLICY, DEPARTMENT OF COMMERCE

GENERAL

In so far as trade policies determined the movements of goods between countries during 1946, the official decisions as to how much of particular commodities should be exported and where they should go were, on the whole, more influential than were the customs duties or other official conditions of admission set by the governments of the importing countries. Of greater influence than either export or import controls, however, have been the acute needs of the war-involved areas for the immediate necessities of life and for products essential to the rehabilitation of their economies, and the unprecedented pent-up demand everywhere for goods that had not been freely available for a number of years.

DOMINANT CONTROLS OTHER THAN TRADE POLICIES

Two factors, in the main, limited the huge volume of international trade needed to meet these exceptional demands: the general world shortages of many essential commodities, especially foodstuffs and coal, and often also of the means for transporting them; and the limited ability of many countries to buy such foreign goods as were obtainable. Most of the changes during 1946 in the trade control measures of individual countries, and the many special commercial arrangements worked out between various sets of countries, seemed largely prompted by these limitations inherent in the disordered post-war situation. In the case of particular countries, certain special motives have been figuring prominently in the regulation of their foreign trade, namely: to hold down imports which compete strongly with similar domestic products; to advance the government's control over the country's economic structure and development; to give special attention to the current trade with certain other countries; or, in certain regions, to promote closer long-term economic relations. During 1946, however, these were usually subordinate to the above overriding considerations.

The general improvement during the course of the year in the conditions of world supply of various commodities, along with the progress toward rehabilitation in a number of countries, especially in western Europe, allowed the relaxation during 1946 of some of the trade controls, in operation at its start by various international bodies and individual governments. However, the return of many countries to more normal world trade relations depends in large measure upon the various political settlements yet to be worked out and to be brought into effective operation. Moreover, most of the countries which had been directly involved in the war are still suffering from the general disorganization of their internal economies.

Varying only in degree, the possibility of these countries resuming foreign commerce in anything like the usual volume and manner is still distinctly limited by many factors, in-

---

*See *Foreign Commerce Weekly* of U.S. Department of Commerce for Feb. 8, 1947.

cluding their low level of production itself is partly the result of inadequate supplies of imported raw materials and fuel—disordered domestic commercial channels, and the unstable state of internal prices and currency values. Even many countries that were outside the active war zones are still in the process of adjustment to the shocks to their economies resulting from the conflict, in the way of dislocation of old industries, stimulations to new developments, and changes in their financial position. Under the circumstances, the major conditions which limited the movements of goods between countries during 1946 and chiefly dictated the year's changes in trade control measures, might on the whole be expected to continue well into 1947.

While war-inherited conditions and short-range pressures are thus still dominating the current foreign trade measures of most countries, certain preparatory steps taken during 1946, upon the initiative of the United States, prepared the way for a series of international consultations and negotiations during 1947 which may set the pattern for world trade for the period ahead. The year 1947 should show how far the important trading countries are ready to agree upon a concerted long-term program for liberal foreign trade policies, as relaxation in the pressures of the post-war transition period allows them more freedom of action.

FINANCIAL LIMITATIONS AND FACILITIES

The financial considerations controlling international commerce have been of a highly unusual character. Among the countries of Europe and the Far East that had suffered destruction and impoverishment by the war, inadequacy of export goods or of other means with which to pay for the large volume of immediate import needs, was to be expected. In addition, certain countries possessing foreign exchange resources had them largely in the form of balances in other countries, which were not freely convertible for use in third countries where particular products desired might be more readily available. This has been especially true of most of the British Empire areas and of certain others for which the United Kingdom has been the major market. Moreover, a number of governments of Europe and of Latin America, which had usable financial reserves, felt impelled to be selective in the importations permitted. They have been particularly restricting purchases of various consumers' goods, chiefly to reserve their funds for foreign products considered more essential to the economy of the country.

On the other hand, a major aid to the resumption of purchasing by many countries with inadequate financial resources were the credits extended them for this purpose, mainly by the United States, Canada, Sweden, Switzerland, and to a lesser extent by certain other European countries and by Argentina and Brazil. A substantial part of the imports during the year to the countries of western and northern Europe that had been engaged in the war was made possible by the various forms of credit extended them during 1946 or earlier. The greater part of the immediate import needs of the war-ravaged countries of eastern and southern Europe, and a sizable part of the import needs of China, were met by relief shipments, mainly through UNRRA, and by transfers on credit of war surpluses located in those regions.

IMPORTANCE OF EXPORT CONTROLS

Governmental trade controls, in so far as they were decisive regulators of the movements of commerce during the year, were for most countries exceptionally important on the export side. These took several forms: international allocating bodies, principally the successors to the wartime Combined Food Board and Combined Raw Materials Board; agreements between various pairs of countries as to the goods for which they would facilitate shipment to each other; and export licensing controls of individual governments. The international allocating bodies endeavored to provide for the most equitable distribution among the nations of the limited supplies of the particular commodities under their control. The export controls of individual governments were usually guided by the desire to prevent undue drain upon supplies needed by their own peoples, and to hold down domestic price advances. Frequently, such controls were used to assist in obtaining needed products from abroad by making the permitted exports to a particular country dependent upon what that country could supply in return.

Very few governments made major changes in their import duties during the year, although a number of tariff revisions is in preparation. In some cases, these are being held up until the prospect as to price levels and the general trend of post-war trade policies becomes clearer. In so far as governments could exercise choice as to the character, volume, or source of the goods imported into their territories, the principal controls used have been import license or exchange permit systems.

Only a few countries relaxed during 1946 the administrative import controls they had in operation at the opening of the year, and some countries even tightened them or introduced new regulatory measures. China was prominent among those which extended rather than relaxed their import controls, although in some measure that tendency was evidenced also in a number of countries of Europe and Latin America. These actions are largely attributable to the fact earlier mentioned, that most countries had as yet achieved only a moderate degree of economic readjustment to post-war conditions. Particularly on the part of the countries of Europe that had been involved in the war, strict licensing control of most imports continued the rule, in order to make the best use of their limited financial resources in the face of unusually large import needs.

GOVERNMENTAL INTERVENTIONS IN FOREIGN TRADE

In general, the extent of direct governmental intervention into import or export transactions of the types developed during or immediately after the war was reduced during the year. Exceptions to this general trend are Argentina and most of the countries of eastern Europe,[1] which are moving toward a high degree of governmental control of their entire economies, with foreign transactions either reserved to official agencies or conducted under their close direction. Most official purchasing missions, so prominent a year ago, especially in the overseas trade of Western Europe, were either in process of liquidation or were curtailing the scope of their operations by the end of 1946. Broadly speaking, arrangements for the great majority of products are progressively being returned to private importers or groups of them, although still subject to governmental licenses for many individual transactions or for the transfer of funds in settlement of them. As an exception to the general rule, however, even certain countries of Western Europe apparently intend to continue governmental purchasing, or at least close official direction of private purchasing, of selected basic import commodities for some time to come, and in some cases also of certain foreign equipment for reconstruction or modernization.

Most of the large-scale intergovernmental procurement arrangements entered into during the war have been terminated or are tapering off. However, official bulk purchase contracts of a peacetime character, covering large parts of the importing country's needs of selected basic foods or industrial materials, were a prominent feature of the 1946 trade programs of a number of countries, notably the United Kingdom. These recent bulk purchase agreements appear to have several common characteristics.

---

[1] Throughout this review, the term Eastern Europe is used in referring to the following group of countries: Poland, Czechoslovakia, Hungary, Yugoslavia, Albania, Rumania, and Bulgaria. The term Western Europe is to be understood as including Scandinavia.

Although broadly arranged for between governments, the actual transactions are in most cases to be consummated by private traders. Moreover, while some governments have declared a definite preference for centralized bulk procurement of certain staple import commodities, the majority of the contracts actually entered into during the year seemed temporary arrangements, and prompted largely by the uncertain prospects as to supplies or markets and as to the stability of prices during the transitional period. In only few cases do the initial terms run beyond a year or two, and even within that period the arrangements are often subject to modification in the light of the conditions under which supplies of the particular commodities become available from other countries.

BILATERAL AGREEMENTS

A striking feature of 1946 was the exceptionally large number of agreements between various pairs of governments regarding commercial transactions between their nationals. These agreements typically include lists of products, the shipment of which each government is to permit or facilitate, up to a specified quantity or value, through the operation of its particular export control system. Permission to import them into the country of destination seems commonly assumed. Settlement is usually through clearing accounts set up in the respective national banks, in order to minimize uncovered balances and to require the least transfers of currencies or gold. Barter deals have seldom figured except in the arrangements with certain countries of Eastern Europe. Only rarely have these arrangements provided for the governments themselves to supply or buy the products involved.

Such agreements have been most common among the countries of Continental Europe and certain of the Latin American Republics. In the inter-European agreements, a rough annual balance in the value of the goods exchanged is usually aimed at, with only limited overdraft permitted, except in those few cases where definite lines of credit are extended by the more prosperous country.

Usually negotiated for not more than a year, the great majority of the many recent arrangements of this type appear to be makeshifts, and do not necessarily imply a fixed program or preference for bilateralism as against open competitive trading. Typically, what each country is primarily seeking is assurance of supplies of particularly needed commodities from the other, with the least drain upon its own products or hazard of excess exports becoming frozen credits.

In most instances, these temporary arrangements to make possible a controlled if limited resumption of trade between the particular pair of countries are understandable. They afford a means of carrying on the most essential exchanges of goods until greater freedom of choice in foreign trading is made possible for these countries, through more ample availability of goods to buy and to sell, through the accumulation of exchange reserves, and through the expected assistance of the International Monetary Fund in facilitating the normal multilateral settlement of trade balances. Only a few of the bilateral agreements concluded during the year carried evidence of definite intention on the part of the contracting countries to give special preference to each other's needs or products, without regard to the possible limitation upon the reasonable access of third countries to their goods or markets.

TRADING WITH THE OCCUPIED AREAS

Thus far, such shipments as have been made into or out of Germany and Japan have either been carried through by the respective occupying authorities or arranged by them. In addition to the imports of supplies necessary to maintain the prescribed minimum living standards, the occupying governments have arranged to ship in certain raw materials for local processing, with the advances paid for from the exports of the manufactured products. In order to offset the costs of these official imports, and to resume the supplying of distinctive peacetime products of Germany and of Japan to the countries which had come to depend upon them, the occupying authorities began during 1946 to encourage local production for export and to find foreign markets for it.

The major part of the export products that have become available to the United States authorities have been disposed of in nearby countries under inter-governmental arrangements, against goods or dollars, although actual deliveries may be made to private merchants. The goods in which American buyers have expressed interest have thus far been handled through the U. S. Commercial Company, as emergency intermediary. From Japan, the principal product shipped to the United States has been raw silk and, since that is duty-free, no customs problem has been involved. From Germany, the early shipments have been cleared through the customs by the U. S. Commercial Company.

The early resumption of private trade between the United States and the occupied countries has been announced as the definite official objective. However, the opening up of direct purchases by American importers of dutiable products from either Japan or Germany waits upon the settling of a number of problems, among them the working out of a satisfactory basis for their customs valuation, since no established home market values yet exist in either country. This and other difficulties arising from the lack of a commercial exchange value for the mark and the yen have been temporarily avoided by pricing mainly in dollars.

An economic merger of the British and American zones of Germany begins in 1947, with the way left open for the Russians and the French to join. This merger is expected to afford a broader basis for foreign trading, as well as to facilitate inter-zonal exchanges and, within a few years, to make possible a self-supporting German economy.

PROSPECT FOR FREER AND CONCERTED TRADE POLICIES

Despite the current confused and constricted international trade situation, the very facts of the continuing general economic unsettlement and of the need for resorting to awkward improvisations in trade policies, at a time when nations feel so keenly their dependence upon each other, appeared to improve the prospect for the long term. They seemed to make many governments more responsive than they were before the war to the idea of acting jointly, in devising means for promoting the recovery and trade expansion of each through international consultation and reciprocal accommodation.

Following the ratification by 40 governments of the Bretton Woods Agreements, the first steps taken toward broad international collaboration in the financial field were the completion of the organization of the International Monetary Fund and the International Bank and preparations for early operation. The International Fund, in announcing in December acceptance of the existing exchange rates of 30 countries as their initial post-war parities, from which no material changes may be made without prior consultation, took the first concrete step toward world currency stability. This fixed the basis also upon which the Fund is to begin performing, in March 1947, its authorized function of assisting member countries in temporary exchange difficulties, by making available to them limited quantities of particular foreign currencies needed for freer import operations, and thus gradually facilitating the shift back from restrictive bilateral settlements to multilateral trading.

On the essential companion program in the trade field, encouraging progress was made in the fall of 1946 by the Preparatory Committee for an International Conference on Trade and Employment, which was convened in London by the Economic and Social Council of the United Nations. Working on the technical level, the representatives of 18 important trading countries reached broad agreement upon plans for the formation of an International Trade Organization, upon a tentative draft of a charter of standard principles of liberal commercial conduct, and upon a concrete program for their early implementation.

The broad objective of the program is the general expansion of the production, exchange, and consumption of goods. It is sought to achieve this mainly through reduction of trade barriers and discriminations in world commerce, and of unduly restrictive trade practices of private or public origin; under certain circumstances, through inter-governmental arrangements regarding the marketing of selected primary commodities; and through concerted action to assist the programs of member countries for high employment and economic development, under safeguards to minimize the possibility of measures in the interest of one country operating to the injury of others.

The full International Conference on Trade and Employment, at which this comprehensive program is to be placed before the nations generally, is now planned for the latter part of 1947. Before that is convened, a testing out of its feasibility is to take place in April at Geneva. In conjunction with the perfection of the draft charter for an International Trade Organization at that meeting, the same 18 governments are preparing to negotiate consolidated trade agreements for the reciprocal reduction of the barriers to trade with one another, in order to give practical effect among themselves to one of the main objectives of the Charter, as the basis and pattern for a world program.

Prospective developments during 1947 should, therefore, be highly significant in showing how far the important trading countries of the world can find it possible to agree upon common operating principles and reciprocal undertakings toward these large objectives of acknowledged desirability. The London meeting of fall 1946 indicated that the chief difficulties will probably come from the necessity of reconciling the obligations involved in such a program with two factors: first, the need felt by many of the war-ravaged countries for an extended transition period before they would be ready to give up the arbitrary and often discriminatory trade controls and practices which they now consider necessary; and second, the strong desire on the part of various under-developed countries for sufficient freedom to restrict imports when that is found necessary to support their programs for diversification and, especially, industrialization.

The working out of methods for satisfactory commercial intercourse with those countries resorting largely to state trading in some form, constitutes another of the difficult problems to be faced in 1947. In view of the distinctly minor place in the aggregate volume of world trade of the commerce of the countries which operate predominantly on a state-trading basis, the formation of an International Trade Organization, embracing the principal trading countries, is not dependent upon their immediate adherence. Earnest effort is being directed to the solution of this problem, however, in order to obtain the the broadest possible participation of the nations in the prospective concerted program for freer and fuller world trade, in the interest of greater general prosperity and durable peace.

PUBLIC ACCOUNTING

By Carman G. Blough
Director of Research, American Institute of Accountants

AUDITING

The year 1946 was one of readjustment, during which accountants turned their attention from the solution of wartime problems to the clarification of certain fundamental auditing concepts. Although no major developments in auditing principles were announced, the profession, through the committee on auditing procedure of the American Institute of Accountants, embarked on a number of studies which are expected to constitute a material contribution to the business community and to society in general.

The study of auditing standards is of particular interest since careful observance of such standards is essential to the continuing significance of the auditor's report. While many reports have stated that the examination was made in accordance with "generally accepted auditing standards applicable in the circumstances," the nature of these standards has never been set down authoritatively by the profession. The committee, therefore, devoted considerable attention to evolving a statement setting forth the standards of professional proficiency and performance which should always govern the independent public accountant in his examination of financial statements.

A useful pattern in which to arrange these standards is provided by dividing the discussion into three phases: (1) General Standards, (2) Standards of Field Work, and (3) Standards of Reporting. General Standards are concerned with the technical training and proficiency of the auditor, the independence he must maintain in his mental attitude and approach, and the care he must exercise in the performance of his examination. "Standards of Field Work involve the adequacy of the preparatory planning of the field work, proper evaluation of the existing internal control for the determination of the extent to which audit testing procedures are to be restricted, and competence of evidential matter. Considerations relating to Standards of Reporting include adherence to accepted principles and practices of accounting, observance of consistency in their application except where conditions warrant otherwise, and the adequacy of informative disclosures.

A statement along these lines should do much to clarify the underlying principles which control the nature and extent of the evidence which the auditor obtains by means of auditing procedures.

Another problem with which the auditor is presently concerned is a determination of the extent to which he can reasonably assume responsibility for the reporting of transactions and other events taking place after the close of the fiscal period for which he is certifying financial statements. There are two major categories into which these events fall. The first is made up of those events which, as hindsight, throw light on the fairness of the representations made in the financial statements and, if availed of, have the effect of substituting more accurate data for some that, at the close of the fiscal period, could only be estimated. Events classified under this category would include, for example, settlements of claims or receivables due from others and settlements of liabilities or claims against the company as at the balance sheet date on a basis substantially different from that initially reflected in the accounts at the date of closing.

The second category is composed of events which the reader of financial statements would find significant in projecting the financial accomplishments of the year into estimates of future accomplishments. They are events which would not change any of the amounts on the financial statements currently under examination because they throw no light upon the accuracy of the estimates of matters reported in the statements as of the balance sheet date. Events, such as an important fire loss or acquisition of substantial plants as well as changes in the management of the corporation or the signing of an important marketing agreement, fall into this class.

The importance of reporting significant events occurring subsequent to the close of the fiscal period is widely recognized. However, the independent public accountant can not accept an audit type of responsibility for ascertainment of these occurrences since it is generally impossible to make an examination of the results of a company's operations and of its financial position at a date coincident with the date of his report. Accountants differ as to whether they should undertake any responsibility for the disclosure of these events. Some hold that, since the accountant's opinion in this regard can not be based upon a thorough examination, he should refrain from attempting to deal with them. Others, however, point out that it is customary for the accountant to scan the accounting records for, and obtain representations from, the management regarding major events occurring up to the time his field work is completed. They suggest that accountants could reasonably assume responsibility for the disclosure of such events when they come to his attention.

These views are receiving the careful consideration of the accounting profession with a view toward developing a generally accepted demarcation of the accountant's responsibility in this regard.

The educational phases of auditing have also received the attention of the Institute's committee on auditing procedure. Its project for the development of case studies illustrating the audit procedures adopted in the actual examination of a variety of businesses is expected to be particularly beneficial to those preparing to enter the profession.

GOVERNMENTAL ACCOUNTING AND AUDITING

The growing determination of Congress to provide itself with adequate accounting information as a basis for judging the accomplishments of government agencies was demonstrated by the passage during 1945 of legislation relating to the financial activities of certain government corporations. This legislation provided for the submission of business-type budgets of operations to the President and the Bureau of the Budget, and for annual audits performed by the General Accounting Office in accordance with principles and procedures applicable to the examination of commercial corporate financial statements. Following passage of this legislation, there was created, within the General Accounting Office, a Division of Corporation Audits. Persons with wide experience in both public and governmental accounting practice were appointed to this division, so it is with particular interest that the accounting profession noted its reports.

The report on Federal Prison Industries, Inc., which, as the first submitted, is expected to set the pattern for reports of other corporations, undoubtedly provided Congress with the most complete and intelligible information it has ever received with regard to this organization. It describes the organic authority of the corporation, its organization and management, its activities and general policies; comments on operations for the fiscal year, exceptions by the auditors to financial programs or transactions of questionable legality or propriety; comments on its financial position, the scope of the audit, and the financial statements, which are accompanied by an opinion expressed in much the same language as is contained in the opinion paragraph of the standard short form of auditor's report.

The results of the division's examination of the financial activities of the Reconstruction Finance Corporation, as presented in a memorandum addressed to the Board of Directors of the RFC, received considerable public notice and emphasized the value of such examinations to Congress in its endeavors to maintain financial control over the activities of such governmental corporations. The memorandum stated that the accounting records of the RFC and its affiliates did not afford an adequate basis for the preparation of financial statements which would fully disclose the financial position of the enterprises at any date or the results of their operations for any period, citing specific examples indicating failure of the accounting function to provide adequate financial control. It also suggested an approach to the solution of this problem.

Although the memorandum was subject to much heated criticism by certain representatives of the RFC, it made Congress cognizant of a situation which merits consideration and, possibly, corrective action. This view is supported by the recent appointment of a controller to supervise the RFC's accounting operations.

The year 1946 also marked the first of a series of reports concerning Federal government corporations to be based on an audit conducted by a public accounting firm under the direction of the Corporation Audits Division. This report dealt with the audit of the Federal Deposit Insurance Corporation for the fiscal year ended June 30, 1945, and, while offering suggestions for improvement in certain specific instances, commended the Corporation's general accounting practices.

Other government units have also made contracts with accounting firms under which the latter have examined the accounts of business organizations or government corporations. Among the government agencies reported to have retained public accounting firms for this purpose are the Termination Division of the Army Signal Corps and the War Assets Administration. The program adopted by the latter is of unusual interest since it appears to have retained one or more accounting firms under a special contract to examine the accounts of agencies, generally business organizations, designated by the Administration to dispose of surplus government property and to report to the Administration on such examination.

These applications of public accounting techniques to government operations under a statutory requirement are undoubtedly of historic significance. The results are sufficiently encouraging to indicate to Congress that it is on the right road to financial control, efficiency, and economy in government.

LEGISLATION

The experience of the few state legislatures which convened in 1946 indicates that in 1947 there will be a multitude of bills introduced to amend existing CPA laws. If the pattern of the past is followed, such amendments might result in a lowering of the standards which many certified public accountants consider necessary in measuring the qualifications of a person desiring to practice as a CPA. This lowering of standards would be brought about by the substitution of special, less difficult examinations for persons with long accounting experience, or for veterans, in place of the regular written examinations which are now required of all candidates for a certificate; by the lowering of education and experience requirements for certain groups; or by setting up a continuing class of licensed or registered public accountants, without examination, which would exist indefinitely, side by side, with the certified public accountant.

The purpose of CPA legislation, the first of which was passed 50 years ago in the State of New York, is to protect the public interest through restricting the use of designations indicating competence or the expression of opinions, upon which third parties may rely, by unqualified persons. Certified public accountants have, therefore, resisted movements which would tend to lower professional standards or permit the continued existence of a second class of accountants who may use a similar designation without being required to give evidence of their qualification to perform public accounting work in a professional manner.

The American Institute of Accountants has urged passage of legislation providing for the registration of two types of persons: (1) "public accountants," those persons who are not certified public accountants but who are currently engaged in the practice of public accounting, and (2) certified public accountants. It is proposed that only registered persons may render opinions upon financial statements or other accounting matters in the capacity of public accountants or auditors, and that the registration of noncertified public accountants be restricted to those currently engaged in the practice of public accounting. It is believed that in this manner *bona fide* public accountants, in practice at the time the legislation is enacted. will be protected, while, at the same time, provision will be made for the eventual registration of only one class of public accountants, those who have given evidence of having met specified standards as to education, experience, and professional proficiency, and have been successful in passing the CPA examination.

ACCOUNTING FOR THE USE OF SPECIAL WAR RESERVES

In October 1946, the committee on accounting procedure of the American Institute of Accountants issued Accounting Research Bulletin No. 26 *Accounting for the Use of Special War Reserves.* A previous bulletin (No. 13) issued by the committee had recognized the propriety of the creation of reserves by charges against current revenues for foreseeable expenses, costs or losses applicable to such revenues but which were to be incurred or determined in a future period. Special war reserves had a clear function in enabling the proper allocation to wartime revenues of war-business costs such as those costs directly related to the reconversion of war plant and facilities. These costs obviously could not be incurred until after the war.

In Bulletin No. 26 the committee endorses the view that charges against a war reserve ordinarily should be restricted to the expenses, costs, or losses incurred during a relatively short period after the termination of war production within which reasonable peacetime operations can be resumed and to the expenses and costs incurred after that time which are clearly attributable to plant reconversion or otherwise clearly identifiable as costs of war production. A correlative policy also sanctioned by the committee would consign as proper charges to *peacetime* revenues those costs and losses which may arise from such causes as: (a) strikes occurring after the resumption of peacetime operations; (b) failure to achieve full peacetime production because of material or other shortages; (c) failure to make profits on peacetime products because of the limitations of price ceilings or because of the lack of full production; and (d) inventory losses on peacetime products from future deflationary price adjustments.

As a corollary to its restrictive viewpoint with respect to those items of expense, cost or loss considered to be proper charges to war reserves, the committee calls for the prompt determination of charges to special war reserves and the early resolving of the remaining expenses, costs, and losses for which the reserve will be carried. The balance of the special war reserve should be adjusted to the amount which reasonably may be required for the applicable items of expense, cost or loss still to be incurred, such items being clearly designated, and excess reserves, if any, should be eliminated.

Critics of the committee's recommended treatment would generally favor a much broader definition of the "war cycle," and consequently would consider as proper charges to war reserves many expenses, costs, or losses which usually arise in a disrupted post-war situation or in the economic dislocations which are the aftermath of a war. However, the committee is of the opinion that if such expenses were to be excluded from the costs of doing peacetime business (by using war reserves to absorb them) because they might have been unnecessary if there had been no war, the resulting statements would hardly be realistic. The committee also sees a danger in the possible misuse of reserves to effect an equalization of earnings as between different accounting periods and considers full revelation of all charges to reserves as important but not as a remedy therefor.

EMERGENCY FACILITIES

In its Accounting Research Bulletin No. 27, *"Emergency Facilities,"* issued in November 1946, the Institute's committee on accounting procedure concluded that special adjustments of past accounting for emergency facilities may in some cases make possible the preparation of more useful and significant financial statements. The basic problem with which the bulletin is concerned arises from the fact that during the war many companies accelerated the depreciation of emergency facility costs for financial accounting as well as for tax accounting purposes.

The committee re-emphasizes the concept that depreciation accounting is basically a process of cost allocation, not of valuation, a system of accounting which aims to distribute the cost or other basic value of tangible capital assets over their estimated useful lives. This procedure has as its objective matching the costs of facilities against the revenues obtained from the productive use of such facilities. Under most circumstances, over- or under-depreciation in former accounting periods is corrected, if at all, by revised rates applied against the remaining undepreciated costs in the current or subsequent periods. Moreover, underestimates of the useful lives of some assets are frequently found to be offset by overestimates of the lives of others, so that in the annual operating results no material or significant change would be effected by a restatement of asset values. However, the committee enunciates the general principle that useful financial statements are not ordinarily achieved by an under-statement or an over-statement of asset carrying value which perforce is to be accompanied by an over-statement or under-statement of future income because of materially excessive or deficient prior allocations of costs.

Accordingly, a majority of the committee has taken the following position: Where the facts clearly indicate that the accelerated amortization or depreciation of emergency facilities at rates permitted for tax purposes has resulted in a carrying value materially less than the costs reasonably chargeable to revenues to be derived from the continued peacetime use of the facilities, and where such difference would have a significant effect upon the financial statements, the adjustment of accumulated amortization or depreciation of such facilities is appropriate. This policy would be feasible when emergency facilities can reasonably be expected to have a continuing use in peacetime years and when the amounts of such assets and the annual depreciation charges thereon are large in relation to the total property in use and significant in relation to the annual net income.

INCOME AND EARNED SURPLUS

Both the Institute's committee on accounting procedure and the various professional publications have been devoting an increasing attention to the income statement and the many controversial accounting and financial questions it involves. The need for a more adequate definition of "net income" and a refinement of the purposes the income statement is to serve is well recognized. On the one hand, net income is defined, according to a strict proprietary conception, as the increase in earned surplus which has taken place within a period excluding, of course, adjustments for dividend distributions, transfers to and from earned surplus reserves, and losses recognized in quasi-reorganizations. This broad conception of net income is best described as the "all inclusive" approach. On the other hand, a different concept places emphasis upon the relationship of cost and income items to the operations, and to the year, excluding from the income account any material extraordinary items which are not so related. This latter approach, which has sometimes been called the "earning performance" approach, would design the income statement to aid those primarily interested in the future prospects of the business as indicated by the results of the ordinary flow of operations.

Accountants recognize the inherent limitations of the term "net income"; that the latter is not a homogeneous datum but a *composite value* reflecting various elements of income, expense, profit and loss; that allocations of both cost and income items affecting the determination of net income as between years are in part estimated and conventional and based on assumptions as to future events; that the ultimate distinction between "operating" income and costs and "non-operating" gains and losses has not satisfactorily been made; that the term "net income" is used lavishly and often without precise definition in the financial press, annual reports, management compensation contracts, bond indentures, etc.; that investors often attach an undue significance to a single figure of net income per share, *et al.* The recognition of these inherent limitations of the term "net income" is fundamental to any improvement in income statement presentation.

It is believed that the most useful form of income statement would be a compromise between the two basic concepts of "net income" and that consideration should be given to the use of a statement which would combine both viewpoints. To this end it has been suggested that a statement be adopted which would include all income elements given recognition in the accounts during the year. The first section of such a statement would show an amount designated "Net Income" or "Net Income for the Year" which would include all items except those which are very unusual in nature or relate to a prior year and are so great as materially to affect the significance of the net income. Any such items would then be reported as either additions to or deductions from "Net Income."

Thus, "Net Income" or "Net Income for the Year" would be designed to represent the results of the ordinary operations and would have considerable significance in formulating judgments as to the current progress and earning performance of the enterprise under the conditions of that period. Items in the second section would in general reflect significant adjustments of prior years' operating costs or income, material losses of a type not usually insured against, and "windfall" gains, so-called capital gains and losses, and the write-off of a material amount of intangible assets or deferred charges. The final figure would be the amount to be carried to surplus and would be the same as the final figure in an "all inclusive" statement.

INVENTORY PRICING

Another matter to which the Institute's committee on accounting procedure is currently devoting its efforts is the question of inventory pricing. The major objective of accounting for inventories is the proper determination of periodic net income through the process of matching appropriate costs against revenues. The various acceptable methods for determining cost for inventory pricing purposes are aimed at arriving at a conservative value for the inventory on hand at the end of a period and determining the cost of the goods sold during such period. The committee is agreed that the primary basis of accounting for inventories is cost, *i.e.*, the sum of the applicable expenditures and charges directly or indirectly incurred in bringing an article to its existing condition and location.

The rule for pricing inventories, which has general acceptance among accountants, is known as the "cost or market, whichever is lower" rule. The merit of this rule is primarily that of conservatism. Application of the rule has the effect of recognizing in the income statement losses in the value of the inventory on hand due to price declines but not recognizing enhancement in the value of the inventory (unrealized gain) due to a rising price level.

In attempting to refine the meaning of "market," as used in the term "cost or market, whichever is lower," the committee has tentatively arrived at the following definition: "Market" means current replacement cost (by purchase or by reproduction, as the case may be) except: (1) Such amount *should not exceed* the net realizable value (*i.e.*, estimated selling price in the ordinary course of business less reasonably predictable costs of completion and disposal); and (2) An amount representing the "market" value of an inventory *should not be less than* net realizable value reduced by an allowance for an approximately normal profit.

It is believed that the eventual publication of a formal bulletin on the subject of inventory pricing, a bulletin which among other things would include a definition of "market," would have a clarifying effect for the profession and would lead to a more universal understanding of inventory pricing principles.

INCOME TAXATION

The Revenue Act of 1945, which in general applies to corporate income tax returns beginning with the calendar year 1946 and fiscal years beginning in 1945 and ending in 1946, was primarily designed to aid both individuals and businesses in the transitional period from war to peace. Under its provisions, individual taxpayers, estates, trusts, and corporations are benefited, the latter to a much greater degree than the others. The principles and procedures developed by the Bureau of Internal Revenue and the United States Tax Court through interpretations, rulings, and decisions with respect to the Internal Revenue Code, and Revenue Acts embodying amendments thereto are, of course, important for professional accountants.

The latest Revenue Act repealed the excess profits tax on corporations, a measure which during wartime taxed all corporations, first at 90 per cent, later at 95 per cent with an overall 80 per cent limitation, on taxable income in excess of the corporation's average earnings for the 1936-39 peacetime years, or alternatively, on income in excess of "normal" earnings arrived at by applying a statutory percentage rate of return to average invested capital in the base years. Generally speaking, the "normal" earnings were taxed at a 40 per cent rate.

The latest act also repealed the capital stock tax and the declared value excess profits tax on corporations in addition to certain relatively minor use taxes. Accountants had looked upon the former two taxes as factors adding an unnecessary complication to the corporate tax structure. Such taxes, relatively speaking, had never been large revenue-producers from the Bureau's viewpoint, and accomplished nothing that increased normal plus surtax rates could not have achieved.

In addition to the above, together with many technical changes concerning which we will not belabor this presentation, the act reduced normal tax and surtax rates on individuals and the surtax rate on corporations. Although no corporate excess profits tax return need be filed for taxable years beginning after Dec. 31, 1945, the provisions of the law dealing with the computation of the excess profits credit are continued in effect for 1946 in order that an unused excess profits credit for such year may be determined. Accordingly, it is possible to carry back an unused excess profits credit originating in 1946 to 1944 and 1945 and obtain a refund of the resultant reduction in excess profits taxes paid for such years. Thus the extent to which a corporation's net taxable income dips below the "norm" in 1946 is considered to represent the "unused excess profits tax credit," and the corporation is afforded the opportunity to replenish its funds by obtaining refund of the excess profits taxes paid in the war years on the unused credit amount.

Of course, myriad tax problems challenge the ingenuity and technical prowess of the accounting profession's practicing members each year. The discussions and recommendations of the committee on Federal taxation of the American Institute of Accountants, as well as those of committees of state societies of certified public accountants which cooperate closely with the Institute, focus upon taxation matters considered to be of most immediate and universal importance. During the year 1946, they have given particular attention to the differences that have been developing between income tax accounting methods and generally accepted accounting principles and practices used in the determination of income with a view to advising congressional committees with respect to amendatory legislation conforming taxation requirements with accounting viewpoints generally accepted by the profession. It has been reported that the staff of the congressional Joint Committee on Internal Revenue Taxation has been working on a simplification and recodification of the Internal Revenue Code. Also, under the new Federal Administrative Procedure Act, changes in Bureau regulations hereafter will be submitted for public comment prior to adoption. This will be a boon to the accounting profession in that it will forestall enactment of many regulations conflicting with generally accepted accounting procedures.

The accounting profession and especially the Institute's committee on Federal taxation have been interested in achieving an effective administration of Section 722 of the Internal Revenue Code. As mentioned previously, under the wartime excess profits tax law a corporation was taxed at the high excess profits tax rates on all taxable income in excess of its average earnings for the 1936-39 peacetime years, or alternatively, on income in excess of "normal" earnings arrived at by applying a statutory percentage rate of return to average invested capital in the base years. Section 722 had been enacted into law by Congress to afford relief to certain corporate taxpayers who could demonstrate that the incidence of the excess profits tax was "excessive and discriminatory" in their case. Generally speaking, if the corporate taxpayer could show that a change in the nature or character of its business took place whereby actual average net income in the years 1936-39 was not representative of the normal earning potential of the corporation, a higher "constructive" average base period net income might be used. The high excess profits tax rate would then be levied only on those wartime taxable profits in excess of the higher "constructive" net income as established for the base years.

Under Section 722, the burden of proof was upon the corporate taxpayer to demonstrate that the excess profits tax was "excessive and discriminatory." The taxpayer might attempt to prove in some factual manner that its average base period net income was an inadequate standard of normal earnings. Any one of a variety of conditions might be used as a basis for such a demonstration. For example, the occurrence of unusual or peculiar events affecting the taxpayer's business experience, depression of the taxpayer's business in the base period due to temporary and unusual economic circumstances relating to the individual case or to the particular type of industry, existence of a profits cycle differing materially in length and amplitude from the general business cycle, or any one of a host of circumstances might effectively demonstrate the need for special relief under the act. Also, a corporate taxpayer using a percentage of invested capital to arrive at average base period earnings might seek to demonstrate that invested capital was abnormally low in base years, capital was not an important income-producing factor in its business, or perhaps that intangible assets not includible in invested capital make an important contribution to income.

The administration of this section

prior to 1946 was the subject of severe criticism by the public and Congress alike. Compliance with congressional intent when Section 722 was enacted called for the exercise of a high degree of judgment applied to the facts of a particular case and called for the solution of high-level economic and accounting problems. Accordingly, the American Institute's committee on Federal taxation, together with others, made recommendations before the Congressional Joint Committee on Internal Revenue Taxation looking toward establishing a highly qualified body charged with the exclusive duty of administering Section 722 and urged that the majority of appointments thereto be made from outside the Bureau.

During the year these recommendations were put into effect by the appointment of an Excess Profits Tax Council composed of accountants, lawyers and business men, of whom a majority were from outside the government, to administer Section 722. This Council has established Field Committees in each field division of the Bureau's Income Tax Unit under the technical supervision of the Council but under the administrative supervision of the internal revenue agent in charge. These committees recommend to the Council the amount of constructive average base-period net income to be allowed on each claim, subject to review by the Council before which the taxpayer is entitled to a hearing. Jurisdiction of the Excess Profits Tax Council, in Section 722 cases, now supersedes that of the Bureau's technical staff except in certain cases now before the staff and nearing completion. It is believed this new administrative set-up will provide for a more expeditious and judicious disposition of this important relief provision of the law.

LIFE INSURANCE

By JAMES S. ELSTON

ASSISTANT ACTUARY, THE TRAVELERS INSURANCE COMPANY

INSURANCE IN FORCE AND NEW BUSINESS

The legal reserve life insurance in force in regular companies Dec. 31, 1946 is estimated by the Life Insurance Association of America at about $174,000,000,000, nearly 12 per cent greater than at the end of 1945, the previous highest amount. This includes $116,000,000,000 Ordinary Insurance, $30,000,000,000 Industrial, and $28,000,000,000 Group.

The new paid-for business for the year, not including revivals or increases, is estimated at $23,500,000,000, an increase of nearly 50 per cent over 1945 and $5,500,000,000 above the previous record of 1929. The new Ordinary is approximately $16,800,000,000, about 35 per cent above the 1929 record; Industrial $4,500,000,000, 4 per cent above the previous highest amount of 1936; and Group $2,200,000,000, 10 per cent above the previous record of 1943. The insurance lapsed or surrendered was comparatively at about the lowest level it has ever been. The combined assets are estimated at $48,000,000,000 and the payments to policyholders and beneficiaries at $2,800,000,000, of which about 46 per cent represents death claim payments to beneficiaries.

WAR SERVICE INSURANCE

There is also insurance in force of about $7,000,000,000 in fraternal orders and assessment organizations and $2,500,000,000 of U. S. Government life insurance on veterans of the First World War. The amount of National Service Life Insurance in force decreased from $120,000,000,000 at the end of the war to about $38,000,000,000 Sept. 30, 1946. In the rush of demobilization, the service men were not impressed enough with the advantages of the insurance. Some were financially unable to continue the full $10,000, and some did

not need it. Under the unprecedented amount of correspondence, accounting, and other work, the Veterans Administration could not cope with all the requests for information and service. There was considerable dissatisfaction with several features; no single sum payable to a beneficiary; beneficiary requirements too strict; no conversion to endowment insurance possible; and no income disability provision included. On Aug. 1 Congress enacted legislation which tended to eliminate the objections to the coverage, and it is hoped that future lapsation will be much less and that much will be reinstated. The life insurance companies and their agency forces rendered great service in assisting the men with their problems and educating them on the value of the N. S. L. I.

LIFE ANNUITIES

At the beginning of the year there were over 2,719,000 life annuities in force for an aggregate annual income of $866,200,000, of which $203,200,000 was actually being paid, $312,000,000 deferred but paid for, and the balance being paid for. The total was divided between $529,100,000 individual annuities, $275,300,000 group annuities covering 1,500,000 American workers, and the balance supplementary contracts, involving life contingencies payable to insured after maturity of endowments and to beneficiaries after death of the insured. Much of these funds was available for spending if they had not been left with the insurance company by the recipient. As said before, this represents intelligent family planning and sound financing for the future welfare of American homes, but it is also an important additional contribution to the anti-inflationary savings of the nation.

DISTRIBUTION OF COMPANY INCOME

In a tabulation by the *Spectator* of 46 of the largest and oldest companies the distribution of $1.00 income for 1945 is worked out approximately as follows:

Death Benefits	$ .168
Paid Living Policyholders	.191
Settlement Options	.048
Added to Assets to Enable Companies to Pay Future Benefits	.445
Total	.852
Commissions and Agency Expenses	.064
Home Office Salaries	.017
Taxes and Fees	.020
Investment Expenses and All Other Operating Costs	.030
Total Expenses	.131
Asset Adjustments (Profit or Loss)	.017
Total	$1.000

The investment income was more than sufficient to meet all expenses. The total paid policyholders, together with the amount reserved to meet future policyholder claims, was greater than the premiums paid by policyholders. From a tabulation of 25 of the largest companies, it appears that in 1945 about 33 per cent of the claims were arranged to be paid under optional modes of settlement as compared with 12 per cent in 1930.

There has been great development in Group accident and sickness, accidental death and dismemberment, hospital expense insurance, surgical benefits, and medical expense insurance issued by life companies because many employers have broadened the Group coverage they had previously.

INVESTMENT DISTRIBUTION

A distribution of investments at the end of 1946 is estimated by the Life Insurance Association of America as:

	1946	1941
Government bonds	44.8%	20.8%
State and local bonds	1.2	6.1
Dominion of Canada bonds	2.6	1.9
Public utilities securities	12.7	15.5
Railway securities	6.3	9.0
Corporate securities other than railway and public utilities	8.7	6.7
Farm mortgages	1.7	2.8
City mortgages	12.9	17.9
Policy loans and premium notes	3.9	8.9
Real estate	1.6	5.7
Cash and miscellaneous	3.6	4.7

Perhaps the most notable change in the distribution of assets in 1946 was in the corporate securities investments other than railways and public utilities, which have reached the all-time high ratio second only to public utilities, among the corporate holdings of the life companies, having now surpassed railroad investments for the first time on record.

A comparatively stationary point has been almost reached in investment in United States Government securities, which now approximate $21,500,000,000, only about $917,000,000 above the 1945 amount. The Life Insurance Association of America comments: "The beneficial effect on the national economy of federal debt ownership by insurance companies and other private investors has been recognized and is being implemented by the United States Treasury through its policy of selective redemption instituted this year. This policy is aimed toward reducing ownership of the debt in channels where it constitutes a basis for commercial credit expansion with attendant inflationary effects. If continued, it may increase the proportion of federal debt held by life companies, even though their holdings decline in dollar value."

COMPANY FINANCING OF RENTAL HOUSING

More than $150,000,000 worth of rental housing, representing homes for an estimated 75,000 persons, is either already under construction by the companies or is scheduled to be started within the next year, it was reported at the end of July by the Institute of Life Insurance. This brings to more than $275,000,000 the total of rental housing being financed by the companies on an ownership basis and to 150,000 the number of persons to be housed by these projects. There are now a number of companies directly active in the construction or operation of housing projects in ten states from California to New York. Many of them are self-contained communities, with a large percentage of the ground devoted to park and recreation areas, representing a new type of planning for densely populated areas. There are at least 20 companies, in addition to those already active, which are keenly interested in possible future housing projects, but some are barred by local laws from immediate action and others are withholding current commitments because of the present high costs involved.

POLICY LOANS

A reduction in the rate of interest on policy loans on large loans was made by one company to meet the competition of banks and in the hope that the average rate of interest earned by the company could be increased by the company's eventually securing some of the loans which would have gone to banks. Considerable discussion developed as to the merits of this plan. It has been claimed that it is discrimination to charge a lower rate of interest to a policyholder with a large loan than to one with a small loan. Such a large proportion of the loans are very small, and the proportion of total policy loans to total investments is so small that other companies doubt that the plan would have any beneficial effect on the average rate of interest earned, and if reduction in loan interest on large loans should lower the average rate earned, the net insurance cost to all other policyholders would be increased. Also the perennial argument is raised that it is undesirable to make policy loans attractive because it would lead in a large proportion of cases to eventual surrender of the policies.

As has been emphasized for several years, one of the most important problems, if not the most important, is the continued low rate of interest earned. There is reason to hope that the low point has been passed on new investments, but it does not seem safe to assume that any marked increase can be expected at least for some time. Unless this rate increases, the cost of life insurance will increase gradually (except as counteracted by improved mortality) until the average rate on all assets, including old investments at high rates, approximately equals the rate on new.

The net rate earned, according to the Institute of Life Insurance dropped in 1945 to a new low of 3.07 per cent compared with a rate of 3.19 per cent in 1944, and 3.61 per cent in pre-war 1940. The present rate is one-fourth less than the average in the 30's. If the previous year's rate had still applied, the return on American policyholder funds would have been $50,000,000 greater in 1945, a sum equivalent to more than 10 per cent of the total dividends paid to policyholders.

The effect of the decline in the past 15 years has not been fully apparent in actual policy costs, as there have been several offsetting factors: the death-rate among policyholders has been for a number of years considerably lower; the expenses of operation have been reduced in relation to income; and there have been other sources of gain, largely of a nonrecurring nature, such as profit from sale of real estate and securities. Nevertheless in this period some increase in life insurance costs has been necessary.

DEATH BENEFITS

According to a compilation of the Institute of Life Insurance at the end of September the following death benefits had been paid under regular life policies owned by members of the armed forces.

(Entire War Period up to Sept. 30, 1945)

	Number	Amounts Paid
Killed in Action . . .	194,000	$200,000,000
Accidental.	60,000	80,000,000
Disease.	18,000	33,000,000
	272,000	313,000,000

The latest tabulations available of the Veterans Administration reveal that dependents of more than 372,000 deceased Second World War veterans are receiving National Service Life Insurance benefits. As of Nov. 1, the face value of the awards exceeded $3,488,000,000. The average amount of insurance in force at the time of the veteran's death was about $9,300. The average monthly payment is approximately $50, and in over 75 per cent of the cases the veteran's beneficiaries will receive the monthly payments for the rest of their lives. Parents are the sole beneficiaries in 65 per cent of the cases and widows in 23 per cent. The Veterans Administration is also paying monthly disability benefits to approximately 1,647,000 Second World War veterans. Of the claims received and adjudicated, approximately one out of every two has resulted in an award.

STANDARD NON-FORFEITURE AND VALUATION LAWS

George A. Bowles, Virginia Insurance Superintendent, has made a strong plea for the adoption by the rest of the states of the Standard Non-forfeiture and Valuation Laws recently passed in most of the states, stating: "When I took office as president of the National Association of Insurance Commissioners in 1936, there was a great deal of criticism of the life insurance industry for the use of the antiquated mortality tables. Many people seemed to believe that the companies were taking advantage of their policyholders by overcharging them for their insurance. . . . I indicated my resolve to appoint a committee of the best available actuaries to study this problem and to develop a new mortality table. After advising with a great many Insurance Commissioners, the committee of state insurance department actuaries, now known as the Guertin Committee, was appointed. . . . There was no demand from the companies for such a committee, and many of them seemed to think such a study both unnecessary and unwise. This committee labored over several years. Its reports have been recognized as factual and unbiased. . . . The revised proposal was then unanimously adopted by the National Association of Insurance Commissioners.

"The important point I want to make is that it was not and is not a company program. . . . It was conceived by the Commissioners in the interest of the public. In its formulation, the committee received the cooperation of the companies and after its formulation, it received the support of the industry organizations very largely because they had come to see the necessity of action on this subject, and because of the fairness of the program to all parties concerned.

"I am sure that the lack of support for this program wherever it may arise results only from lack of understanding of what it is and what it will do. . . . If the people and the legislators of the states where this legislation has not yet been adopted will realize the tremendous effort which has been put in its preparation in the resolving of conflicting viewpoints in the public interest, that the experts dealing with this matter have considered all the elements entering into the fair treatment of policyholders, and that it has the wholehearted support of the Insurance Commissioners of the United States. they will accept it as highly enlightened and progressive legislation."

Most of the companies were engaged in 1946 in preparing for the adoption of the Commissioners Standard Ordinary Mortality Table as the basis of reserves and surrender values in their policies. A few companies have actually adopted the new table. Under present conditions policies have to conform to both the old and the new laws. The Northwestern Mutual has just announced that they are issuing new business on the 2 per cent CSO Table as of Jan. 1, 1947.

Joseph B. Maclean, former President of the Actuarial Society of America, has explained as well as could be in non-technical language why the new laws will not increase the cost of insurance: "It can be said, however, that the use of a modern mortality table will not increase the total cost of insurance protection but should result in a more equitable distribution of the total costs according to age and duration and is therefore in the interest of the whole body of policyholders. It is important to realize that if (as is quite probable) there is any general increase in the cost of life insurance it will not be because of any of the effects of adopting the proposed standard legislation. It will be because the combination of lower interest earnings and higher expenses is more than enough to offset any continuing improvement in mortality rates. It is the actual experience as to mortality, interest and expense, not the assumptions, which determine the cost to the policyholder."

VETERAN EMPLOYMENT IN INSURANCE COMPANIES

Nearly 50,000 veterans had been employed up to the end of June by life companies, according to an estimate by the Institute of Life Insurance. The business had 45,400 of its personnel enter the armed forces, of whom 800 were killed in action.

	Returned to Company	New to Company
Home Office.......	9,300	1,400
Branch Office........	2,600	200
Ordinary Agents.....	4,500	8,200
Industrial Agents.....	11,600	9,700
	28,000	19,500
Total.......................47,500		

RIGHTS OF STATES IN INSURANCE TAXATION AND SUPERVISION

The rights of the states in taxation and supervision of insurance were affirmed in certain respects by the U. S. Supreme Court in June. After insurance was declared to be interstate commerce, question arose about discrimination of certain state tax laws against companies domiciled in other states, and various court actions were instituted in several states. The question reached the Supreme Court from a South Carolina statute, which ruled that that particular statute was valid. In the other case the right of California to license not only agents but to exclude entirely companies in interstate commerce, which did not comply with the state solvency requirements, was upheld.

HEMISPHERIC INSURANCE CONFERENCE

The first hemispheric insurance conference ever held took place in New York in May. Many of the leading figures in insurance from a large number of countries attended, including many from Latin America. The main advantage of the conference was the greater understanding by insurance men of the different countries of the problems and viewpoints of each other. The conference covered all lines of insurance—not detailed problems but the more general aspects of the different lines of insurance from the viewpoints of these countries, the keynote being "Insurance—the Symbol of Private Enterprise."

MEDICAL RESEARCH FUND

The Medical Research Fund established under the auspices of the companies has now been operating for 15 months and has had available $735,000. Grants have been made to assist 54 research groups in 43 medical schools and hospitals spread over 31 states, the District of Columbia, and including six awards to medical schools in Canada. In addition 20 fellowships have been awarded.

FIRE INSURANCE

By Edward R. Hardy

Secretary-Treasurer, Insurance Institute of America, Inc.

FIRE LOSSES

The presentation of the monthly statistics on fire losses are taken from the reports of the National Board of Fire Underwriters. These statistics have been used for many years because, being compiled on the same basis, they furnish a sound foundation for comparison. In the year 1946, the fire losses were $561,487,000. These figures, as formerly, are for the losses by fire and lightning. A glance at the losses for the two years preceding, set forth in the adjoining table, will show an extraordinary increase.

The increase in fire losses might arise from the increase in the actual number of fires or from a larger loss by fire, if only the same number of fires occurred. In the latter case it would be owing to the increased value of properties, and the natural result by fire would be greater. As a matter of fact there are no statistics giving the number of fires that occurred in a given year. It would be difficult to define just what is a fire, possibly, and to bring together accurate statistics would be a very large job indeed. It took many years to persuade all

FIRE LOSSES BY MONTH

	1944	1945	1946
January	$38,572,000	$44,865,000	$49,808,000
February	38,280,000	41,457,000	51,759,000
March	39,084,000	40,876,000	53,252,000
April	34,746,000	37,950,000	52,153,000
May	32,815,000	34,153,000	46,094,000
June	30,555,000	34,090,000	44,240,000
July	32,706,000	34,054,000	40,998,000
August	30,618,000	34,096,000	40,019,000
September	31,448,000	32,447,000	40,256,000
October	32,173,000	34,470,000	40,108,000
November	33,847,000	37,393,000	44,706,000
December	48,694,000	49,478,000	58,094,000
Total 12 months	$423,538,000	$455,329,000	$561,487,000

the states and territories to prepare their reports of deaths on a uniform blank which could be used for compiling statistics for the country. It probably would take at least a decade, if not three, to collect reliable reports from each state and territory concerning the number of fires. The attempt has been made to keep a record of the number of fires in the United States and Canada which had a loss of $10,000 or more, but this account when brought together showed only a fraction of the total losses. This means that a large amount of the loss occasioned by small fires, less than $10,000, has a great significance.

Not only from the property but from the loss of life point of view, the year 1946 was outstanding, especially in hotel fires. The fire in the hotel in Atlanta, Ga. (Dec. 7, 1946) is said to have occasioned the largest loss of life of any hotel fire, not merely for 1946 but for preceding years. These losses where life was involved to a serious extent have led to a re-checking of the fire prevention work. It stimulated the civic conditions of cities and towns where the losses occurred and finally to a re-checking of all properties where life may be involved in a fire, such as, hotels, etc. The result will probably be beneficial, but it has not yet brought about any new knowledge in regard to fire prevention. It was its lack of application which made it possible for the disasters that have occurred.

STANDARD POLICY OF FIRE INSURANCE

The standard policy of fire insurance, which began its career in New York State, July 1, 1943, has now been adopted by 41 states, two territories—Alaska and Hawaii—and the District of Columbia, although with variations in eight states. The Massachusetts standard policy, with statutory variations, is used in four states. California, Iowa, and Texas have statutory standard policies which differ considerably from the other forms. It is possible, with the changes to be brought about in the conduct of the business by Jan. 1, 1948, that everywhere in the United States and its territories the standard policy of 1943 will be used.

LEGAL CHANGES

As a result of the decision of the Supreme Court, in 1943, that insurance should be classified as commerce and so subject to United States Government regulations, there has been an enormous amount of work done and must continue to be done in 1947 because, by Jan. 1, 1948, every state that wishes to retain the control of fire insurance must have its laws in conformity with the decision of 1943. Should any state fail to provide for this purpose, the United States Government will take over, at least that part of the regulations that do not conform to the decision of 1943.

In order to comply with the 1943 decision of the Supreme Court, a committee known as the All-industry Committee was organized for the purpose of drafting a measure which would embrace the views of the business and the regulating bodies of the various states as a necessary compliance with the purposes sought, bringing together state and United States regulation. Two proposed measures may be said to embrace this purpose, and while a final decision will not be reached until nearer 1948 these conclusions undoubtedly bear a high degree of approach to agreement by the parties interested.

The casualty and surety representatives proposed a Rate Regulatory Bill and the same is true of the fire, marine, and inland marine Rate Regulatory Bill. The casualty suggestions were submitted for casualty and surety, and the other for fire, marine, and inland marine. There will, therefore, be some difficulties, but the final outcome will be the same, namely, to suggest agreements upon a bill for all lines of the business, subject to regulation under the decision of 1943. The principal problem was the determination of rate-making and the activities which grow therefrom. These are numerous; they always have been and probably will continue to be. There is considerable insistence that the bills as drafted shall invite competition but that competition shall be regulated so as to prevent abuses.

FIRE GRADING OF BUILDINGS

There has just been published in Great Britain, No. 20 of Post-War Building Studies, Part I, to be followed by three more parts, devoted to fire grading of buildings. It is a pamphlet of more than 100 pages and is a very comprehensive study of the subject. It has been published for the Ministry of Works by His Majesty's Stationery Office and may be secured in this country at the British Information Services, Rockefeller Plaza, New York. It is undoubtedly the outgrowth of the bombardments of the Second World War. The joint committee is composed of the Building Research of the Department of Scientific and Industrial Research and of the Fire Offices' Committee, and was formed early in 1942. Of the three remaining parts to be published, Part II will be *Fire Fighting Equipment in Buildings*, Part III *Means of Escape* and Part IV *Chimneys and Flues*. It will be interesting to see if such a comprehensive piece of work has any effect in the United States. The problem here would be quite different for no other reason than the fact that such a high percentage of our building construction is frame.

THE OUTLOOK

If one were to undertake the character of a prophet, two possible changes will take place. The safest one to predict is that there will be a growing tendency to have policies that cover a wider scope than existing policies. The business grew up on a single line plan of underwriting, that is, fire insurance not coupled with any other line. After casualty insurance was introduced, for many years there was no tendency for many years to suggest a union of such lines with the fire policy. In fact the laws did not permit it, but with the development of even the single device, such as the automobile, there was a demand for the private owner, at least, to have this included in his fire policy. In other words, the tendency grew and will continue to grow to make the policy of insurance more like a blanket policy in its coverage than was the practice hitherto. The decision of the Supreme Court in 1943 would appear rather to hasten this development than to retard it. There is no reason why, properly developed and controlled, a policy may not be evolved which will take care at least of the property of the private owner under a single coverage, except life. To an extent, this may be included in the business coverage, but that may not prove to be quite so necessary especially where larger interest is involved. The year 1948 ought to prove the answers to many of these questions.

CASUALTY INSURANCE AND CORPORATE SURETYSHIP

By William Leslie

General Manager, National Bureau of Casualty and Surety Underwriters

---

STATE LEGISLATION

Rate Regulation.—Kentucky and Mississippi, two of the nine states meeting in regular session in 1946, enacted casualty and surety rate regulatory laws, making a total of 11 states with Alabama, Connecticut, Florida, Kansas, Maryland, North Carolina, South Dakota, Tennessee, and Texas, that have enacted such laws since the United States Supreme Court decision in 1944 holding that insurance is commerce and, when crossing state lines, is interstate commerce. Louisiana enacted legislation directing the Secretary of State to adopt a new insurance code to be submitted to the 1948 session of the legislature, and the Virginia legislature directed the Advisory Legislative Council to recommend necessary changes in the insurance laws.

Workmen's Compensation. — As usual there was a considerable volume of legislation on workmen's compensation. California and New York enacted laws providing for increases in benefits. Georgia can now be added to the list of states in which occupational diseases are covered under workmen's compensation. Kentucky enacted a law which makes workmen's compensation compulsory as to certain named hazardous occupations, and which includes "silicosis" within the definition of "injury." Both Kentucky and Alaska adopted laws setting up special second injury funds to take care of compensation to partially disabled employees sustaining subsequent injuries.

Automobile Financial Responsibility.—The trend toward strengthening the automobile financial responsibility laws continued, with Kentucky repealing its existing law and substituting one including the requirement of furnishing security in the event of an accident. Missouri enacted a new financial responsibility law, applicable to convictions and unsatisfied judgments but not requiring security in the event of accident.

Health Insurance.—About 25 bills providing for compulsory health insurance were introduced but California alone adopted such legislation. However, New Jersey, Rhode Island, Massachusetts, and Virginia set up special commissions to study the problem, and in New York a bill was passed to continue the special commission created in 1945 to formulate a long-range state health program.

Miscellaneous.—Missouri and New York approved multiple line legislation. A bill was enacted in New York authorizing the Superintendent of Insurance, in his discretion, to prescribe, by regulation, uniform classifications of accounts to be observed, and statistics to be reported by insurers and other organizations.

FEDERAL LEGISLATION

Among the measures which the 79th Congress enacted in 1946 was a law amending the Social Security Act by freezing the present tax rate of 1 per cent payable by employees and employers, and a law relating to claims against the United States (Federal Tort Claims Act). The President's Reorganization Plan No. 2 which, among other things, transferred the functions of the U. S. Employees' Compensation Commission to the Federal Security Agency, became effective July 16, 1946, upon the failure by Congress to disapprove the Plan. The U. S. Employees' Compensation Commission formerly administered the District of Columbia and Longshoremen's and Harbor Workers' Compensation Laws.

WORKMEN'S COMPENSATION INSURANCE

The *Workmen's Compensation and Employers' Liability Insurance Manual* was revised effective Oct. 1, 1946 to permit the elimination, for premium computation purposes, of the remuneration of individual employees in excess of an average of $100 per week for the total time employed during the policy period. Concurrently, the manual rates were increased for a few classifications where it was decided that a sufficient amount of remuneration would be eliminated to be measurable. The rates for other classifications where the effect is minor and thus not readily measurable were not changed, although it was recognized that this payroll limitation will affect all classifications in some degree.

Recognizing that the present payroll basis of exposure has certain disadvantages which are accentuated in periods of abnormal industrial activity or periods of depressions, study is being given to either a modification of the present payroll basis or the adoption of an entirely different basis of exposure. In order to obtain factual information on the practical problems involved, actual audits on various bases are being made of representative risks. The exposure bases which are being analyzed are various payroll limitations, man hours, man days, and man weeks. This study will disclose just what basic records are kept by employers generally, what checks or controls are available for the verification of original records, and the amount of time spent by the auditor in obtaining the various data. This information will be extremely valuable in determining whether there is a satisfactory substitute for the present payroll basis of exposure.

The National Council on Compensation Insurance has prepared consolidated reports of the information reported by 167 carriers in the Casualty Insurance Expense Exhibit covering the calendar year 1945. The National Association of Insurance Commissioners has authorized the appointment of a committee of departmental experts to cooperate with the industry in the preparation of supplementary instructions designed to produce up-to-date information on the gradation of workmen's compensation expenses by size of risk. It is believed that such additional information can be obtained as a supplement to the Casualty Insurance Expense Exhibit for calendar year 1946, thus becoming available for rate-making purposes in 1947.

There has been no change in the basic rate-making procedure that has been in effect in recent years. The two most recent policy years for which experience data are available are used for rate-making purposes. The 1946 rate revisions produced a further decrease in rates in some states, but in many others an increase in rates was necessary. This means that the favorable trend in loss experience has leveled off and that hereafter more rate increases may be indicated.

MISCELLANEOUS LIABILITY INSURANCE

Of the many changes in the miscellaneous liability field during 1946, the most extensive and perhaps the most important was the second revision of the comprehensive personal liability policy. The policy, first brought out in 1943, is a broad-coverage, single-limit policy insuring individuals for liability for personal as distinguished from business acts and omissions, and also affording medical payments coverage for injuries, regardless of liability, arising out of the premises or caused by activities of the insured. The revision resulted in considerably more coverage at no increase in premium charge, a simplification of the policy language and the introduction of several new features of coverage available on an optional basis. Some of the important changes were: (1) broadening of medical payments coverage to include, without additional premium charges, coverage for accidents away from the premises caused by activities of an insured, by the activities of a residence employee while engaged in the employment of an insured, or by an animal in the care of an insured; (2) broadening of the definition of insured to include as insured, persons under the age of 21 not related to but in the care of an insured; (3) broadening the definition of premises covered by the policy; (4) providing for coverage on a non-caused-by-accident basis (except as to medical payments) so that any occurrence involving liability for sickness, disease, death, or destruction is covered except if caused intentionally by or at the direction of the insured.

The substantive revision of the comprehensive personal liability program was accompanied by other changes relating to premium charges for this coverage. In this connection, the factors for increased limits of liability were reduced, an amendment to the basis-of-premium rule was introduced to provide that no charge applies for residence employees whose time of employment is not more than one-half of the customary full time, and manual rates for business pursuits and for watercraft were adopted. Simultaneously, other amendments were made in the several liability manuals and significant was the revision of the farm employers' liability rates, the adoption for contractual liability insurance of several new classifications and rates, and revisions in existing rates and classifications.

Many other developments of consequence and general interest took place in 1946. The employers' liability rates in Mississippi were revised resulting in an average reduction of 22.4 per cent. A payroll limitation rule was adopted for manufacturers' and contractors' liability, workmen's compensation and employers' liability insurance, providing for the elimination, for premium computation purposes, of wages of any individual employee in excess of an average of $100 per week. New classifications and revised rates and minimum premiums for butane and propane dealers for manufacturers' and contractors' and product liability insurance were announced. The 1 per cent surcharge for comprehensive liability insurance was eliminated. A rating program was promulgated for completed-operations coverage for the State of New York in connection with proposed extensive highway construction. Rules, rates, and a standard coverage for residence water damage and explosion insurance and aircraft and other vehicle damage under combination residence policies were also promulgated.

Any review of miscellaneous liability insurance would be incomplete without brief mention of developments directly relatable to the termination of the war. A new wrecking classification and rates for manufacturers' and contractors' liability insurance were established covering the dismantling in sections or panels of dwellings not exceeding three stories in height, for re-erection in connection with the Federal emergency housing program for veterans. The underwriting rules, classifications, rates and minimum premiums previously established for the Defense Plant Corporation were made applicable to the United States in connection with surplus properties owned by the Government and leased through the War Assets Administrator. Finally, the amount represented by the retroactive wage increases for stevedoring operations in certain ports retroactive in most cases to Oct. 1. 1945, to the date on which such increases were approved, were excluded in computing manufacturers' and contractors' liability, workmen's compensation and employers' liability premiums.

AUTOMOBILE LIABILITY INSURANCE

The most outstanding development during 1946 in the field of automobile liability insurance was the steadily mounting cost of settling claims, especially those involving property damage. Near the close of 1945, the private passenger automobile bodily injury rates had been increased to a level somewhat below that existing prior to the war and, similarly, the property damage rates were increased to a point slightly above the pre-war level. Before the end of the first six months of 1946, however, the increasing claim costs and accident frequency made it necessary that additional rate increases of a substantial nature be established. The average claim cost for the first six months of 1946 for bodily injury was 27 per cent above the 1941 cost, and for property damage it was 83 per cent above the 1941 level. It seems apparent that the rate increases announced during 1946 for private passenger automobiles will not be sufficient to make it possible for companies to meet the mounting loss costs and greater accident frequency which have prevailed since the termination of gasoline rationing. The appalling record of highway accidents and fatalities throughout the nation in 1946 has caused real concern to Federal authorities and to state motor vehicle departments.

In April, 1946, the automobile medical payments insurance applicable to private passenger automobiles and school buses was extended to apply to commercial automobiles, funeral cars, private livery, public livery, taxicabs, and buses. Under this form of coverage the insurance company agrees, without any regard for liability, to pay medical expenses, including funeral expenses, resulting from bodily injury caused by accident. Simultaneously with this improvement, an entirely new and improved method for rating commercial automobiles was established, recognizing the present day conditions in the automobile industry and state registration requirements for commercial automobiles. Also, a decided improvement in the procedure for rating automobile dealer and repair shop risks was made available.

The final steps in the development of the fourth revision of the standard provisions for the basic automobile liability policy were taken near the close of 1946. This revision. which accomplishes a simplification and clarification of policy language. is soon to be made available for use.

BOILER AND MACHINERY INSURANCE

Losses in 1946 were of grave concern to the companies. During the recent war years, when industry was producing at peak capacities, it was not always possible to make the necessary inspections or to replace worn equipment. This condition is now being reflected not only in an increased loss ratio but also in the occurrence of large losses. To cite an instance, one recent loss far exceeded any previous catastrophe loss in the history of boiler and machinery insurance. A new edition of the *Manual of Boiler and Machinery Insurance* was prepared for introduction throughout the country, becoming effective Jan. 1, 1947. This manual represents essentially a rearrangement and clarification of the material in the previous manual.

BURGLARY, THEFT, AND ROBBERY INSURANCE

The success of the Money and Securities Broad Form Policy, which provides all-risk coverage on money and securities for commercial firms. has been largely responsible for the introduction of additional broad form policies this year. Two new policies were introduced and a third developed to facilitate a form of coverage previously made available by endorsement to an existing policy. The first, the Paymaster Broad Form Policy, covers the actual destruction, disappearance, and wrongful abstraction of money and checks intended solely for the payroll of the assured. The premium is based on the rates for the regular paymaster robbery coverage plus a nominal loading for the so-called all-risk feature. The other new policy was placed on the market in December and is known as the Excess Securities Coverage for Banks Policy. This form was designed to meet the needs of banking institutions for additional coverage on securities in excess of the blanket bond normally carried. The rates for this coverage have been designed to produce a somewhat higher premium than that produced by the usual Bank Burglary and Robbery policies, because the new form is on an all-risk basis but lower than cost of a blanket bond for such excess amounts since the policy does not cover infidelity of employees as is the case under the blanket bond. It is believed that these forms will prove as popular as the other broad form policies now available. The Securities Insurance Policy was developed to facilitate the handling of insurance on securities deposited for safekeeping with a bank or trust company. This coverage was formerly made available through the Public Officials Policy, but the rates and coverage are the same as heretofore.

Since the Residence and Outside Theft Policy was substantially broadened in 1943, the loss ratio has steadily increased and is still a point of major interest. Present indications point to a possibility that the present rate scale will not be sufficient to carry the policy in spite of increases effected during the year. The premium volume for burglary lines has been increasing steadily over the past few years and has now reached an all-time high. There is good possibility that the volume will not show any decline during the coming year, because such factors as the scarcity of most materials and finished articles, the increased values of all property, and the sharp rise in criminal activity throughout the nation act as a constant reminder to the public of the need for burglary insurance.

GLASS INSURANCE

The major point of interest in 1946 was the steadily increasing loss ratio which had risen sharply over previous years. Owing largely to the strikes in the glass manufacturing industries, a serious shortage was created throughout the country which brought about some unusual conditions directly affecting the cost of settling losses. The insurance companies found many instances where a plate size had to be cut from a much larger size resulting in considerable waste, or because the glass was not available at all, the opening had to be boarded up until the replacement could be made. Replacement costs were further affected by price adjustments during the period of Federal price control, and since the removal of controls additional increases have been recorded with indications pointing to still further rises in the near future. It would appear that the present rate scale is not sufficient to carry the policy, and further rate increases will be necessary.

ACCIDENT AND HEALTH INSURANCE

In the field of accident and health insurance the most important development was the effort on the part of the industry to develop more complete regulatory legislation, the purpose of which would be at once to eliminate from the business publicly harmful practices and to meet the demands of the Federal Government as expressed in Public Law 15. The casualty and surety rate regulatory bill. not being applicable to accident and health insurance principally because that branch of the business is personal insurance, much of it being written by life insurance companies. accident and health interests gave consideration to a revision of the existing Standard Provision Law, in order to modernize that law and appreciably to increase the amount of regulatory authority contained therein.

Of equal importance were efforts on the part of the industry to satisfy public demands, expressed in part by legislation being introduced into many state legislatures and the Congress, for health insurance coverage spread over a larger segment of the population. Studies were made, the purpose of which was to give a clearer and more accurate picture of the degree of coverage already in force. Studies were also made of the problems surrounding the granting of coverage to a larger portion of the rural population. Insurers also established points of cooperation with the medical profession with a view to writing minimum medical, surgical, and hospital costs coverages—all to the end of supplying basic protection to a larger proportion of the population.

In the latter part of 1946 the task of revising the occupational classifications manual was begun. Such revision has been made necessary by changes in the hazards of industry, brought about principally by improved industrial methods developed during the war. New occupations will be classified, many now classified will have to be reclassified, occupations now obsolete will be omitted. The task is expected to be completed by the end of 1947 and in such a manner that thereafter the manual will always be up-to-date.

BROADENING OF AIR ACCIDENT POLICIES

Despite predictions of greatly increased air travel in the years immediately ahead, accident policies were again broadened, so far as aviation hazards are concerned, to Jan. 1, 1949 to cover passenger airline travel anywhere in the world and to cover passenger travel in private planes within the bounds of North America, all without additional cost to the policyholder. Coverage was further extended to include ground coverage for insured engaged in the aviation industry. The extension of individual accident and health policies to members of the Armed Forces within the continental United States, without additional premium and despite policy exclusions to the contrary, was continued on the same basis as it has been since the outbreak of the war.

GROWTH OF ACCIDENT AND HEALTH INSURANCE

The remarkable growth of this branch of insurance, so noticeable during the past few years, continued, particularly in the field of group insurance, although the rate of growth declined somewhat in 1946 with the falling off in the rate of increase of employment. Public interest in accident and health insurance, however continued its unprecedented increase and insurers increasingly tried to meet the demands with desired coverages. Medical, surgical, and hospital expense coverages appeared to increase in popularity, as did the franchise or wholesale method of underwriting. Accident and health premium volume for all types of carriers including life insurance companies reached a new high of $600,000,000 in 1946 with an estimated 50,000,000 persons insured by insurance companies and Blue Cross plans. Loss ratios favorably affected the past several years by wartime full employment and greatly restricted use of the automobile, now threaten to climb appreciably with the full scale and increased use of the automobile, increased medical, surgical, and hospital costs arising out of the generally increased cost of living, rapid development of and increase in air travel and expected fluctuations in the economic cycle.

SURETY BONDS

The deceptive nature of the increase in fidelity premiums during 1945 will be clearly evident from the premium volume in 1946. It will be recalled that during 1945 many surety companies changed their underwriting practice to permit the writing of fidelity and blanket bonds on a three-year basis at two and one-half times the annual premium. When this change took place, many assureds availed themselves of the opportunity to effect a savings in premium. As a natural consequence, the fidelity premium for 1945 showed a marked increase and the same reasons account for the decrease that they showed in 1946. Despite the change, many companies have indicated success in holding a good fidelity premium volume. During 1946, substantial numbers of new sales were made, and, in addition, increased values caused many prudent insurers to increase their coverage correspondingly.

Surety volume in 1946 fell below expectations. The rigid restrictions imposed by the Government on commercial and public building necessitated the postponement of many undertakings which the surety companies would normally guarantee.

Fidelity losses were substantially increased during 1946. Both the number of claims and the amount of the claims increased. It is difficult to attribute the increase to any one particular factor. No doubt the prevalent crime wave had its effect upon the surety companies. Many losses, however, were of long standing but recently brought to light. During the war, manpower shortages had, in many instances, caused careless practices and inadequate checks and audits. Commerce is now becoming more nearly in balance again, and the renewal of regular and frequent auditing has resulted in the discovery of many speculations which had continued over several years in the past.

One of the outstanding events in the year was the announcement by the surety companies of new forms of Performance Bond and Labor and Material Payment Bond for use in private construction. The old forms used in private work were the same as those used in public work, and, in many instances, were not entirely satisfactory. The new bonds imposed a direct liability upon the surety rather than the ultimate loss guarantee, which was the condition of the old forms. The new forms have created a lively interest in the market, but because of the severe restrictions on building few of them have been used. A substantial demand is anticipated when restrictions on building materials are lifted.

AVIATION LIABILITY INSURANCE

The year 1946 was probably the most difficult as well as exciting in the entire history of world aviation insurance. Large numbers of war surplus aircraft were disposed of to private owners. As the aircraft manufacturing industry was converted to a peacetime status, new makes and models of aircraft were placed on the market, which created for underwriters new and serious problems until the flight characteristics of such aircraft became well known. The year 1946 also saw the advent of the first of the post-war super airliners, which underwriters were called upon to cover, involving extraordinarily high values, limits of liability, and peak potential catastrophe risks.

The aviation insurance market in the United States and elsewhere was materially expanded, new-comers having been attracted to this field by the profitable underwriting experience of previous years. Premium income increased but competition forced rates to a low level. Competition from non-admitted carriers was an important factor in aviation insurance throughout the United States.

The year saw in the United States, and throughout the world generally, a series of airline and charter operation losses that in the aggregate assumed catastrophic proportions. Many of the losses suffered arose out of problems that were to be anticipated in conversion of aviation from military or semi-military character to peacetime conditions. As new and larger equipment incorporating many new features are placed in operation, fresh problems will arise which underwriters realize will require the exercise of the greatest caution and the application of all available knowledge and experience. While loss frequency may decrease, when accidents do occur the amounts involved in losses will continue to rise as has been the case over a period of years.

NET PREMIUMS WRITTEN

(By kind or type of insurance, by all U. S. casualty companies, including state funds, in the calendar years 1942–45).

Kind of Insurance	Net Premiums Written in Calendar Years			
	1942	1943	1944	1945
1. Workmen's Compensation	$590,984,782	$650,417,182	$641,518,082	$614,732,517
2. Automobile Bodily Injury	350,267,017	284,627,763	320,079,518	366,044,029
3. Automobile Property Damage Liability	114,338,583	111,296.922	122,135,971	138,639,024

DIVISION XI

AGRICULTURE AND ALLIED INDUSTRIES

CONDITIONS IN AGRICULTURE

By Arthur P. Chew
Office of Information, Department of Agriculture

GENERAL

After the war ended, the world food crisis faced this and other food-surplus countries with new demands upon their food supplies. Famine threatened whole continents; it was vital to halt the peril, not only for reasons of humanity, but as a means of building peace. This country responded energetically with an export contribution during the 12 months ended June 30. 1946, which was practically double the first estimate of requirements. Most Americans had hoped that the termination of the war would diminish the drain upon the American food supply and put an end to shortages of some items. Instead, the demand changed suddenly from livestock products to grain and for a short time bread became comparatively scarce. Farm operators thought they could restore their normal crop rotation, diminish their acreage of soil-depleting crops. and prepare in other ways for ordinary peacetime conditions. Actually they faced another season of all-out production fully as exacting in its demands as those of the war years.

As the largest source of exportable foods, the United States became the largest supplier of relief foods. This responsibility imposed on farmers many changes in their crop and livestock balance, on processors many changes in their operations, and on consumers many adjustments in the composition of their diets. It involved acceptance of irksome food orders, of food priorities in transportation, of scarcities in items that previously had not been scarce, but the compensation in substantial relief of the world food crisis was adequate. Mass hunger continued throughout vast areas but did not develop into the threatened mass starvation. Huge food exports, principally from the United States, tided the hungry millions over until 1946 crops came in.

FOOD EXPORTS

In the year ended June 30, 1946, the United States exported more than 16,500,000 long tons of foodstuff, chiefly to war-devastated countries where starvation threatened. It accepted a bread-grain commitment for this period of 400,000,000 bushels which was met in full. Specifically, exports of wheat and flour (10,333,000 tons), plus corn and corn products (407,000 tons), reached 402.000,000 bushels. Approximately 5,549,000 tons of bread grains moved out from Jan. 1 through June 30, 1946. Enough more was then on hand at ports to ensure fulfilment, with only a few days of grace, of the six-month goal of 6,000,000 tons. This brought the total to 417.000,000 bushels, an excess of 17,000,000 bushels above commitments.

Estimates in December 1945, when the Department of Agriculture accepted the 400,000,000 bushel commitment, indicated our wheat and flour exports in the second half of 1945 had totaled 175,000.000 bushels. Accordingly, the remaining 225,000.000 bushels (6,000,000 long tons) became the January-June goal. Subsequently, complete records revealed that July-December exports had totaled 192,000,000 bushels. Nevertheless, the Department allowed the goal of 225,000,000 bushels to stand.

In addition to the above-mentioned bread grains, the United States exported rice, oats, rye, and barley. Total grain exports amounted to 11,792,000 long tons in the year ended June 30, 1946. Exports of dairy products in the same period totaled 760,000 tons, of meats 582,000 tons, and of fats and oils 356,000 tons. Other exports included dry peas and beans, potatoes and sweet potatoes, fruits and vegetables, sugar, eggs, and dried fish. Shipments in this category made a total of more than 3,200,000 tons. Out of all the food distributed from United States supplies in 1945-46, one pound in every eight went overseas to foreign countries. More than 40 per cent of the wheat distributed as food was exported, more than 35 per cent of the rice, more than 20 per cent of the cheese, more than 10 per cent of the fats and oils, and about 6 per cent of the meat.

FOOD NEED OUTLOOK

Nevertheless millions were still hungry after this contribution had been made. The relief shipments. plus the 1946 harvests, gave only a breathing spell. Some areas had to stand further ration cuts in 1946. down to bare subsistence levels. Food-production conditions were better than in 1945 over most of the world, but food-crop acreage was still below pre-war average, and shortages of fertilizer and other essentials tended to restrict the yields. If the harvests, not yet fully in at this writing, fulfill the promise of the summer, the world's food output will exceed the low production of 1945, yet it will not be equal to the pre-war average, particularly on a per capita basis. Moreover, preharvest stocks will be extremely low. Total world supplies of food products for the 1946-47 crop year can not much surpass those of the previous year and can not warrant much decline in total world relief shipments.

THE PRESIDENT'S WARNING

A nationwide warning regarding prospective world food shortages came from the President on his return from Potsdam in August 1945. In October the Department of Agriculture reported that the 1945-46 world output of food on a per capita basis would be as much as 10 per cent below the pre-war average, and that shortages would be very unequally distributed by countries. Later reports, reflecting greater drought damage, placed the estimated world reduction on a per capita basis at 12 per cent below the pre-war average, with the reduction running to 50 per cent in North Africa and 25 per cent in Europe. Even in normally food-surplus countries such as Argentina and Australia, food supplies were drastically reduced. It was evident in 1945 that liberated and ex-enemy countries would require substantial food imports, though the great extent of the need was not then fully apparent. In February the President announced a nine-point program. This program, the announcement stated, would inconvenience consumers, food trades and industries, and transportation systems, but the inconvenience would be a small price to pay for saving lives, mitigating suffering, and helping to establish peace.

NINE-POINT PROGRAM

Following were the nine points: (1) campaign to conserve food, especially bread; (2) disuse of wheat and restricted use of other grains for alcohol and beer; (3) extraction of more flour from wheat, and restriction of flour distribution; (4) control over inventories of wheat and flour; (5) rail priorities for wheat, corn, meat, and other essential foods; (6) control over exports of wheat and flour; (7) exports of 365,000 tons of fats and oils, 1,600,000,000 pounds of meat, and increased exports of dairy products particularly cheese and evaporated milk during 1946; (8) provision of more ships to move food exports and bring in Philippine copra for cocoanut oil; (9) conservation of grain in the feeding of livestock.

The President appointed a Famine Emergency Committee, with former President Herbert C. Hoover the honorary chairman, and Chester C. Davis chairman. On this Committee's recommendation he also appointed a National Famine Emergency Council of about 125 members. Administrative responsibility for carrying out this program devolved upon the Department of Agriculture, which appointed state managers and county managers throughout the country, and in Washington established an Office of Emergency Food Programs.

Simultaneously, the Department reexamined its procurement and distribution programs. It issued various orders which reinstated protein meal set-asides, limited the use of grain for industrial and beverage alcohol, increased the wheat extraction rate for flour, restricted mixed-feed production and inventories, and restricted the sale and use of wheat mill feeds. Set-asides on beef, veal, and mutton, which had been suspended Sept. 2, 1945, and reinstituted Oct. 14, helped the meat-export movement. The Department reinstituted and increased the pork set-aside. Also, by broadening the set-aside coverage to include non-federally inspected plants certified as sanitary and by decreasing the number of exempt states it increased the other meat set-asides. In line with the policy of conserving feed, the Department announced that on June 30 the subsidy of 50 cents per pound to cattle feeders would be terminated. This subsidy had encouraged the feeding of grain to cattle and the feeding of cattle to heavier market weights. In the famine-emergency situation the opposite policy became desirable.

U. S. EMERGENCY SERVICE

Thus 1946 did not find the United States unprepared. Organization, science, and effort on farms had placed us in a strong food position domestically, with power to boost our exports quickly. This was evident at once. Exports of agricultural commodities in the January-March quarter exceeded $846,000,000 in value, and were 69 per cent greater than in the first quarter of 1945. Meantime, farmers were ready for another high-production drive, through cooperatively planned crop adjustments and acreage increases, state by state and farm by farm. Federal agencies were ready for emergency service. Using machinery created or developed during the war years, they effectively encouraged continued maximum production, ascertained world food needs, and procured and allocated food supplies.

WHEAT IN FAMINE RELIEF

As a famine-relief food, wheat was especially important. Wheat was not the only food this and other surplus-food countries were sending abroad; the shipments also included coarse grains, fats, beans and peas, rice, dried fruit, sugar, meats, eggs, and dairy products. Nevertheless, wheat was the principal requirement. This was because wheat could be shipped, stored, and rationed more readily and in larger quantities than any other food that would support life. Moreover, wheat was central in the famine-relief situation for another reason. With other foods also very short of meeting the demand, it was convenient to express the deficient calorie requirement in terms of wheat equivalent. Consequently, the estimated wheat requirements reflected not only the demand for wheat as such, but also the demand for unobtainable other foods.

Large wheat exports from the United States took place in the last half of 1945. In that period about 200,000,000 bushels, or nearly five times the average export in the 1932-41 pre-war years, were exported. This total for the second half of 1945 was the export volume for all purposes to all parts of the world. In 1946 the requirements came more predominantly from the relief countries. Because our wheat stocks, mostly located far from the seaboard, were declining rapidly and because the other wheat-surplus countries were likewise approaching the end of their wheat reserves, the relief demand presented an extremely difficult problem. There was no possibility of meeting it in full. So great, in fact, was the spread between the world wheat supplies and the world wheat requirements, that the differential provided a sort of famine barometer, on which attention centered throughout the world. Every available bushel was in demand, and the pressure of the emergency necessitated extreme measures to conserve, collect, and ship this vital bread grain.

EARLY ESTIMATES OF FOOD NEED

About the turn of the year, surveys had assembled a mass of information about the war damage suffered by agriculture in many countries, about the drought losses that took place in 1945 in Europe, Africa, Australia, and parts of Latin America, and about the mounting food deficits of many Oriental countries. Also available at that time were more precise indications about available world food supplies. These included facts with regard to shortages of seed, machinery, fertilizer, and draft power, light on grain collections, and information about other distribution problems. It appeared that minimum world wheat-import requirements for the 12 months—July 1, 1945 to June 30, 1945—would approximate 1,200,000,000 bushels.

The requirement for the July-December period had been largely met; this totaled about 470,000,000 bushels. It was evident, however, that meeting the estimated requirement for the January-June period would be far more difficult. Estimated at 725,000,000 bushels, the total for this period seemed likely to be not more than 60 per cent filled. In fact, even this percentage of fulfillment was sure to put a strain on the wheat resources of the surplus countries. Only the most strenuous conservation and collection program could give any hope at all of coming appreciably nearer to the estimated 725,000,000 requirement. In looking beyond the 12-month period above-mentioned, it seemed probable the world's wheat-import requirements would continue to be high during the rest of 1946.

REDUCTION IN THE COTTON CROP

The 1946 cotton crop was exceptionally small, yet it was bringing farmers the largest gross farm income, from lint and seed together, since 1925 and possibly since 1919. On the basis of the October crop estimate and the average prices received by farmers to that date, gross farm returns from cotton will approximate $1,750,000,000. This would be about 2 1/3 times the 1935-39 average returns, though the crop is 30 per cent smaller than the average for those years. Domestic production costs have increased greatly but not nearly as much as cotton prices. Prices near those now prevailing will encourage farmers to increase their plantings in 1947. Moreover, improvement in the farm-labor situation and in machinery supplies would facilitate increased production.

Stocks of cotton in the United States Aug. 1, 1946, totaled 7,500,000 bales. These stocks, together with the small 1946 domestic crop, indicate a United States supply for the current season (exclusive of imports) about 3,000,000 bales smaller than that of 1945-46, and almost 8,000,000 bales less than at the outbreak of the war in Europe. World stocks of cotton totaled about 21,000,000 bales on Aug. 1, 1946, and were some 4,000,000 bales smaller than a year earlier, though about 3,500,000 bales larger than the 1935-39 average. The reduction in stocks more than offset an indicated increase over 1945 in the 1946 world crop.

CONTINUED DEMAND FOR MEAT

The end of the war brought no letup in the strong domestic demand for meats. Consumer expenditures for commodities and services during 1946 were above the record of 1945. In addition, a pressing need developed for meat to feed people in European countries. Actions by the Department of Agriculture to speed meat shipments to starving people overseas included increases in the first half year in the meat set-asides, and cooperation with the Office of Price Administration in a slaughter-control program to prevent diversion of livestock to the black markets. Military purchases of meat dropped sharply below those of 1943-45, but this reduction was partly offset by an increased domestic demand as military personnel returned.

Meat production continued at near record levels in 1946. Moderately below the 1945 production of 23,000,000,000 pounds, it was around 40 per cent greater than the annual average production of 16,000,000,000 pounds in the period 1935-39. Pork production was up moderately from the 10,000,000,000 pounds produced a year earlier. Beef and veal production, while still large, fell below the record of 11,800,000,000 pounds in 1945. After the pronounced wartime decline in sheep numbers, lamb and mutton production in 1946 was the lowest since 1941, yet it was above that for any pre-war year.

Exports of meat in 1946 were above the 1,200,000,000 pounds shipped in 1945 though below the record of 2,500,000,000 pounds in 1943, in which year the trade was largely on lend-lease account. Meat exports in 1946 were distributed in large part by UNRRA. Other large recipients were France, Belgium, Netherlands East Indies, and United Kingdom. In prewar years these countries, with the exception of the United Kingdom, were not important markets for our meat.

TOBACCO CONDITIONS

Conditions in 1946 were favorable for tobacco. Despite cutbacks in military requirements and the termination of lend lease, total use of leaf in domestic factories was near the wartime peak, whereas exports exceeded pre-war levels. The year's crop was bumper, and early sales by growers were at record prices.

Cigarette consumption in this country has recently been at an all-time high. Cigarette production, about 80 per cent of all tobacco products, has been near the peak reached during early 1945, though overseas shipments have taken only about 10 per cent of the total as compared with more than 30 per cent at the height of the war. With larger supplies available, cigar consumption has increased.

Smoking tobacco consumption, however, has fallen sharply, primarily because more cigarettes have been available. During periods of high income, consumers show a preference for cigarettes. After the closing of war plants, where smoking was generally prohibited, the consumption of chewing tobacco products declined, and is again on the down grade.

Tobacco stands high among agricultural commodities in international trade. The United States is the most important tobacco-exporting country. Stocks of tobacco in many foreign countries during the war became very low and in some instances disappeared. Hence keen competition resulted this year for exportable supplies, and as mentioned, the movement from the United States exceeded pre-war levels. It reflected requirements both for immediate consumption and for rebuilding stocks.

RECONVERSION IN THE WOOL INDUSTRY

Reconversion was effected quickly in the domestic wool manufacturing industry, and use of wool in civilian manufacture in 1946 was at a record peacetime high, some 70 per cent above the 1935-39 average. Nevertheless, through much of the year, supplies of finished products fell short of demand. In the early months of the year there was a serious shortage of men's clothing, owing largely to the return of several million servicemen to civilian life over a space of only a few months. Various problems faced by clothing manufacturers in expanding their output of civilian clothing also contributed to the shortage. In 1947 supplies are expected to be more in line with demand, but a high general level of consumer incomes and the need for replenishing inventories can be expected to maintain wool consumption at levels not greatly below that of 1946 for the next year at least.

To maintain growers' incomes, the Commodity Credit Corporation in 1946 again purchased the domestic clip at ceiling prices. Prices to growers averaged about 42 cents a pound. This average, converted to a mill-point clean-content basis, was materially higher than the equivalent duty-paid price of imported wool on a comparable basis. In order to make domestic wool available to manufacturers at prices more or less competitive with foreign wool, the CCC sold domestic wool through most of 1946 at prices which averaged about 8 cents, grease basis, less than purchase prices. Although large supplies of domestic wool were available from government stocks, mills continued to use imported wool for a large part of their requirements, and government stocks continued large.

SHORTAGE OF FATS AND OILS

The world shortage of fats and oils continued. Liberated Europe wanted at least its pre-war volume of imports, but production in many sources of supply was below the pre-war level. Consumption in several European countries was less than 50 per cent of the pre-war consumption. Even the United States could have consumed in 1946 an additional million tons of fats and oils had the supply permitted. World import requirements for 1946 were from 5,000,000 to 6,000,000 short tons. Supplies available for export from all sources were estimated at less than 3,000,000 tons.

World production of 21 major fats and oils during the period 1935-39 averaged about 21,500,000 short tons in terms of oil. This total included all of the important vegetable oils such as soybean, cottonseed, peanut, sunflower, flaxseed, coconut, and palm oils; the animal fats—lard, tallow, butter; and the whale and fish oils, and is an estimate in terms of oil available for consumption after deductions for seed and feed, and consumption of commodities other than fats and oils. World production of these same fats and oils in 1946 may be 17,500,000 tons—80 per cent of the pre-war level. The decline is the result of wartime blockades, enemy occupation of producing areas, and inadequate shipping. Production of the coconut and palm oils declined most, and the output of marine oils declined sharply.

FRUITS AND VEGETABLES

As during the war years, farmers in 1946 produced bountiful crops of fruits and vegetables. Aggregate production set a new record, slightly above the tonnage of 1945. Numerous individual crops set new records, including grapefruit, peaches, pears, plums, almonds, onions, lettuce, tomatoes, melons, and processing green peas. Various others were near record and well above average. The large potato crop was exceeded only by the 1943 crop. The apple crop was near average and well above the short 1945 crop.

Supplies of most fruits and vegetables available for domestic consumption in 1946 were the largest in several years. This resulted mainly from the large commercial production, increased imports of bananas, and sharp reductions in military takings. Production in farm and home gardens and orchards again was large, and canning and preserving of fruits and vegetables again was encouraged.

Demand for the 1946 crops of fruits and vegetables continued strong, and prices received by farmers for fruit averaged near those of 1945, but for potatoes and fresh vegetables, they averaged somewhat below. The combination of large crops and high prices resulted in cash incomes to farmers comparable with the high incomes of recent years.

POULTRY

Varying circumstances substantially affected the poultry industry. Supplies of all poultry products were short of demand in the early part of the fiscal year until the close of the war. Egg production was relatively high, but the shortage of meat created an extremely high civilian demand for eggs. Coupled with military demands and continued lend-lease requirements, civilian demand provided ample outlets at good prices.

War Food Orders controlled the marketing of chickens from commercial broiler areas and in the midwestern states. These orders were necessary to help meet military requirements. There was a record production of turkeys, yet a War Food Order was necessary to obtain turkeys to meet military needs. The situation changed quickly, however, when the war ended. Egg prices in the midwestern areas fell to low levels. Heavy production continued with questionable outlets, and the market was uncertain. This condition lasted through September 1945; thereafter egg prices increased.

MILK CONSUMPTION

The wartime increase in fluid-milk consumption continued into 1946. When the year began, numerous fluid-milk markets, particularly along the east and west coasts and in the south, had not enough milk to meet demands for fluid-milk consumption at ceiling prices. To help meet this demand, milk was being shipped from Minnesota and Wisconsin to eastern and southern points.

The shortage was attributable less to a reduction in production than to an increase in the demand, enhanced in effectiveness by the fact that prices of fluid milk were held relatively low by price ceilings accompanied by substantial dairy production payments to milk producers.

Milk production during 1946 was somewhat below the record production of over 122,000,000,000 pounds produced on farms during 1945, but it was well above the pre-war average. The number of milk cows on farms Jan. 1, 1946, was about 3 per cent below that of Jan. 1, 1945. Replacement stock was less than a year earlier—7 per cent in heifers one to two years old and 6 per cent in heifers over one year old.

WORLD SUGAR SITUATION

Twelve months after the capitulation of Germany and Japan, effects of the war were still evident in depleted sugar supplies. Beet-sugar production in Europe from the 1945 crop was only a little over half the pre-war level. Java and the Philippine Islands, the great exporters of the South Pacific, were practically out of sugar production; Formosa was producing only about 15 per cent of its pre-war output. Production in Cuba increased greatly during the war period, but the increase there was not sufficient to offset great declines in Europe and the Orient. World production of beet and cane sugar in 1945-46 was only 27,200,000 short tons (raw value), compared with a pre-war (1935-39) average of 34,500,000 tons.

With world sugar production down nearly 7,500,000 tons from the pre-war level, it was necessary to continue international programs for allocating world supplies among consuming countries, and to continue sugar consumption and price controls in the United States and other sugar importing countries. Total imports of sugar into the United States in 1946 were below the pre-war level, partly because of the lack of available supplies from the Philippines, and partly because of the necessity to share the reduced world output with other countries.

For the calendar year 1945, the limited supply of sugar available to the United States and some of its allies was divided among certain neutrals, liberated areas, the United States, United Kingdom, and Canada on the basis of a parity formula developed by the Interagency Committee on Foreign Shipments in 1945. The recommended allocations provided that the available supplies should be so divided as to provide an identical per capita consumption of cane and beet sugar for the United States, United Kingdom, and Canada. Smaller amounts were allocated to other areas on the basis mainly of their pre-war consumption.

It was not possible during 1946 to increase sugar rations as much as was anticipated just after V-J Day. The Cuban 1946 crop of 4,450,000 tons, although nearly 500,000 tons greater than the 1945 crop, was materially below early expectations, and the Puerto Rican crop yielded only 910,000 tons of sugar compared with the initial estimate of 1,100,000 tons. Rationing during the 1945-46 fiscal year, however, was more efficient than in the previous year. This country was able, while contributing to world food needs, to increase the rationing of industrial users to 60 per cent of the 1941 base by April 1, 1946 (as compared with the 50 per cent level in effect during the preceding nine months for most industrial users). Out of the total Cuban exportable surplus of 4,150,000 tons in 1946, about 2,000,000 tons were earmarked for other countries, principally the United States, Canada, France, and Holland.

FARMERS' EARNINGS

It seemed from indications in August that the net income of farm operators in 1946 might be as much as 8 per cent greater than that of 1945. Net income is what the farmers have left after deducting their expenses of production from their gross income, that is, the amount available for farm family living, savings, etc. Production expenses for 1946 ran about 11 per cent above those of 1945. Some of the items involved may be noticed.

Expenditures for purchased feed, for example, were higher, partly because feed prices had risen and partly because the farmers in the first half of the year fed their livestock more liberally. Expenditures for hired labor were greater than in the previous year, reflecting a slight increase in the number of hired workers employed at higher wage rates.

Costs or charges for farm maintenance and depreciation averaged higher, in part because farmers were able to obtain larger supplies of farm machinery and motor vehicles. Total costs of operating farm motor vehicles rose during 1946. Expenditures for fertilizer and lime also were above those of 1945, since both the amounts used and the prices had increased.

In addition, farmers in some parts of the country paid higher taxes for local government, the expenses of which had increased. On the other hand, interest payments on farm mortgages declined slightly, in line with reductions by farmers in their mortgage debt.

Because of these changes in production costs, the net income to farm operators increased slightly less than the gross farm income. Cash receipts from marketing, which constitute the greater part of the gross farm income, ran as much as 9 or 10 per cent over 1945. The same percentage gain appeared in early estimates of the 1946 value of farm products consumed in farm households, so that American farmers over-all gross farm income—from sales, home consumption, and government payments—was expected to show an increase of about 10 per cent in 1946 as compared with 1945.

In dollars the cash receipts from farm marketings ran $2,000,000,000 above last year's $20,800,000,000. Considerably more of the increase came from marketings of crops than from marketings of livestock and livestock products.

Cash from marketings of crops exceeded those of 1945 by as much as 16 per cent, largely as a result of increased returns from wheat, feed crops, and cotton. Some increase took place in the receipts from livestock and livestock products. In this branch of agricultural marketings, meat animals and dairy products were chiefly responsible for the betterment. Government payments to farmers were slightly higher than those of 1945. In physical volume the marketings were about the same as those of 1945. A higher volume of crop marketings was offset by a smaller volume in livestock and livestock products. Volume increases were notable in wheat and vegetables, while marketings of cattle and calves, of poultry and eggs, and of tobacco decreased.

THE PRICE-CONTROL CRISIS

The price-control legislation, under which the wartime price stabilization program operated, extended only to June 30, 1946. It was evident inflationary pressures would not subside by that time. Accordingly, the President early in 1946 requested Congress to extend price-control legislation and also the authorization to pay subsidies for a full year beyond June 30. Congress, however was not willing to do so without substantial amendments. An amended bill was not agreed upon by the respective branches of the Congress until late June. A drastically revised price-control bill was then sent to the President who returned it with a veto message which again urged the continuation of effective price-stabilization legislation for a full year.

The bill, stated the veto message, continued the Government's responsibility to stabilize the economy but destroyed the Government's power to do so. The message objected especially to a provision which made it mandatory in establishing price ceilings for manufactured articles to allow the same profit per unit of sale which the industry had received for the particular product in 1941. Inflationary consequences would have resulted from such a requirement because 1941 was a year of abnormally high unit profits for most manufacturers and because in the year ahead output in most lines could be expected to exceed that of 1941.

After receiving the President's veto message the Congress took no further action by July 1. Consequently, on that date the country was without price-control legislation. The President asked all groups to keep prices in line pending clarification of the price-control issue.

The response was mixed. In general, prices of food products on which subsidies had formerly been paid moved upward. During the first two weeks of July the Bureau of Labor Statistics weekly index of wholesale prices advanced 7 per cent. Food rose 18 per cent and farm interest and taxes, advanced to 199 on July 15—11 points over a month earlier. The index of prices received by farmers advanced 12 per cent from 218 on June 15 (1909-13 = 100) to 244 on July 15. In July this index was nine points higher than the previous record established in May 1920. Prices received by farmers averaged 123 per cent of parity, equal to the previous all-time high established in April 1943.

Action proceeded in Congress with a revised bill, and on July 25 Congress passed and the President approved the Price Control Extension Act of 1946. The President indicated that, though the measure provided no absolute assurance that inflation could be avoided, it offered a sufficient prospect of success to warrant wholehearted effort. Price ceilings were restored under the amended Price Control Act at June 30 levels, except in the case of certain exempt items.

On Oct. 15, 1946, the Secretary of Agriculture approved an order submitted by the Price Administrator which removed price ceilings from all livestock and all food or feed products processed or manufactured in whole or in part from livestock. This decontrol action followed conferences with the President. The announcement stated that liberal marketings of cattle for slaughter were necessary to prevent over grazing, and yet could not happen while there was considerable agitation for the removal of price ceilings.

TRANSACTIONS BY COMMODITY CREDIT CORPORATION

Total purchases made by the Commodity Credit Corporation during the fiscal year 1946 amounted to $2,100,000,000. Sales during this period amounted to $3,000,000,000. These figures compare with purchases of $2,600,000,000 and sales of $3,100,000,000 in the 1945 fiscal year. Collateral acquired from producers in satisfaction of loans amounted to $64,000,000 in the fiscal year 1946, compared with $205,000,000 in the preceding fiscal year. Before valuation reserves are taken into account, the book value of commodities owned by the Corporation on June 30, 1946, was $651,000,000. This amount is $541,000,000 less than the comparable book value of inventory held on June 30, 1945.

During the fiscal year the net loss of the Corporation was $830,400,000 or $4,400,000 less than during the prior 12-month period. The total cost of subsidy programs was $845,000,000 an increase of $102,000,000 over the previous year. The principal offset to losses incurred during the year was a profit on sales of cotton amounting to $91,500,000. Not included in the subsidy losses mentioned above is a loss of $32,000,000 representing the cost of the export differential absorbed by the Commodity Credit Corporation under the cotton and wheat export program.

SCHOOL LUNCHES

The National School Lunch Act. approved June 4, 1946, established a permanent basis for a program which the Department of Agriculture has administered since August 1935. Participation in the school-lunch program during the school year 1946-47 will probably include some 8,600,000 children in 48,000 schools. School lunches in the 1945-46 school year benefited 7,000,000 children in 44,000 schools.

The new act authorized appropriations to the Department of Agriculture to assist states in "the establishment, maintenance, operation, and expansion of nonprofit school lunch programs." The money will be given as grant-in-aid to states to reimburse schools for food and equipment purchases.

Funds authorized for equipment are limited to $10,000,000 annually; funds for school-lunch food, however. will vary from year to year with requirements. Apportionment among the states will be in line with numbers of school children between 5 to 17 and with per capita state incomes

Federal funds, if accepted, must be matched, dollar for dollar, by state funds until 1951. Thereafter, until 1955, the state contribution must be increased to $1.50 for every Federal dollar. After 1955 the state must provide three times the Federal contribution. In a state whose per capita income is less than the average for the United States, however, the matching required for a fiscal year may be decreased by the percentage of difference between the state's per capita income and that for the United States.

Assistance may be given to nonprofit private schools that meet eligibility requirements, as well as to public schools. In most cases, Federal funds for both types of school will flow through state educational agencies. In states not legally authorized to disburse contributions to private schools, the state offices of the Production and Marketing Administration will handle the contracts.

INDUSTRIES FOR RURAL AREAS

Growth of local industries offers advantages to many rural communities. These advantages include increased employment, better incomes, and higher levels of living. Urban and rural people may share the benefits, which take form in expanded markets for both industrial and agricultural products. Particularly important to rural people is the chance such growth provides for farm youth not needed on the farm to get nearby nonfarm jobs.

Necessarily, the industrial opportunity varies greatly among states and regions, in line with comparative advantages; some regional specialization develops naturally in industry, just as it does in farming. Frequently, however, opportunities for local industrial growth remain undeveloped, with bad effects on the local economic balance. It is a general rule that states and regions which have little industry to complement their agriculture have comparatively low average per capita incomes. As the degree of industrialization rises, the income level rises also.

The Department of Agriculture recently compared income figures for 12 scattered, random-selected rural counties of relatively high industrialization with the corresponding figures for neighboring predominantly agricultural counties. In the most industrialized counties the trade and income figures for 1939 indicated that the per capita income averaged $304. The corresponding figure for the farming counties was only $187. Annual retail sales averaged $312 in the industrialized counties and $233 in the farming counties. Farm home values, a good index of farm prosperity, averaged $1,511 in the industrialized counties and $1,231 in the predominantly farming counties.

FARM PRODUCTION

Major contributions to the largest aggregate volume of crops ever produced, on the basis of preliminary estimates, were made in 1946 by record crops of corn, wheat, potatoes, tobacco, peaches, pears, plums, citrus fruits and truck crops; near-record crops of oats, rice, peanuts, grapes, cherries, and sugarcane; and average or better crops of hay, flaxseed, sorghum grain, soybeans, buckwheat, sweet potatoes, dry beans, apples, prunes, apricots, hops, and sugar beets. Production of broomcorn, dry beans, pecans, and particularly rye and cotton were below average.

Farmers harvested their third successive wheat crop of over 1,000,000,000 bushels and their second successive 1,500,000,000-bushel oats crop. The fifth successive corn crop of over 3,000,000,000 bushels was in prospect, with the aid of mostly favorable planting and growing conditions. About 67.5 per cent of the acreage was planted with the higher yielding hybrids, with seven-eighths of the hybrid acreage in the high-yielding Corn Belt. The first tobacco crop in excess of 2,000,000,000 pounds appeared certain.

Even as the citrus crop from the 1945 bloom exceeded any previous crop, that from the 1946 bloom promised to top the previous year. Production of deciduous crops was large although the apple crop was a little below average. Production of commercial truck crops for the fresh market set new records of more than 9,000,000 tons from over 2,000,000 acres. The second largest supply of processing vegetables in history was available. The cotton crop of less than 9,000,000 bales was one of the smallest in the century, owing to both a small acreage and a low yield per acre.

Total food-grain production was over 37,000,000 tons, 1,000,000 tons more than in 1945, when the previous high mark was set. Total feed-grain production of 128,000,000 tons was 4 per cent larger than in 1942, the previous record year. With a larger than average hay supply and a larger tonnage of other roughages, feed supplies were abundant. This was true, despite the relatively small carry-over stocks of feed grains. Since the number of livestock and poultry on farms had decreased during 1946, the supply of feed grains per animal unit was the largest in the 21 years of record.

Livestock and livestock products were produced in an aggregate quantity about 6 per cent below that of 1944 and 1945, and 10 per cent below the high mark of 1943. In each of the categories—meat animals, wool, mohair, dairy and poultry products—production was less than in 1945. It was estimated that nearly 43,000,000,000 pounds liveweight of cattle, hogs, sheep, and poultry would be produced in 1946, about 2,000,000,000 pounds less than in 1945 and 8,000,000,000 pounds less than in 1943. However, this would be more than in any year prior to 1942.

COTTON, GRAIN, AND OTHER FIELD CROPS

By Paul L. Koenig
Vice Chairman, Crop Reporting Board, Department of Agriculture

---

GENERAL

The total crop output in 1946 was the greatest in the history of this country. High yields which resulted from the favorable growing season were a major factor in this achievement, although the harvested acreage was fairly large. The aggregate volume of all crops was 26 per cent above the 1923-32 (pre-drought) averages, 2 per cent more than the previous record production in 1942, and seven points above the 1945 total. The total acreage of 52 crops harvested in 1946 was 345,800,000 acres, less than in any of the preceding three years.

Production of the eight food and feed grains was the largest of record, amounting to 162,503,000 tons. The previous record total was 155,017,000 tons produced in 1942. Corn, wheat, and rice established new production records in 1946, whereas oats contributed the second consecutive crop exceeding 1,500,000,000 bushels. The four food grains—wheat, rye, rice, and buckwheat—totaled 36,974,000 tons. The four feed grains—corn, oats, barley, and sorghum grain—totaled 125,529,000 tons. The total of each group exceeds that of any previous year. Expressed in bushels, the food grains totaled 1,253,025,000 bushels, 4 per cent more than in 1945, and 32 per cent above the 10-year (1935-44) average. Feed grains totaled 5,167,881,000 bushels, 8 per cent more than in 1945 and 26 per cent above average.

Production of hay, which is exceeded in dollar value only by corn and wheat, was 7 per cent below the large 1945 crop, but 10 per cent above average. The 196,725,000 bushels of soybeans harvested for beans set a new production record for that crop.

COTTON ACREAGE

The 18,179,000 acres of cotton in cultivation on July 1, 1946 was 617,000 acres or 3.5 per cent more than the acreage planted in 1945. This was the first upturn in acreage since 1942. Some increase occurred in all major cotton states except South Carolina, Georgia, and Oklahoma. More than half of the net upturn, however, was in Texas, with Alabama, Mississippi, and Arkansas accounting for the major portion of the additional increase.

A persistent downward trend in cotton acreage has prevailed since the mid-twenties, dropping from a peak of 45,968,000 acres in 1925 to a low of 17,562,000 acres in 1945. With only a slight increase in the 1946 plantings, the acreage remained at a very low level and was nearly 7,500,000 acres less than the 10-year average and at a level about equal to that planted in the middle 1880's.

At planting time the price of middling spot cotton was around 27 cents per pound, the highest since 1924. With the general belief prevalent that labor would be somewhat more plentiful than during the war, the cotton trade anticipated a considerably larger acreage in 1946 than was actually planted. The increase was limited mostly by (1) unfavorable weather during the planting period, (2) a scarcity of viable seed, (3) a shortage of labor, and (4) the general uncertainty with respect to the availability of machinery, repair parts, and fertilizer. In addition to these deterrents, farmers, especially in the central Belt, had to plow under in the spring of 1946 a record proportion of the 1945 crop which could not be harvested because of unfavorable weather and a shortage of harvest hands. There was very little incentive in plowing under what should have been the previous year's profit and then planting the same crop again. During the spring of 1946, it was quite common for delta cotton farmers to have a crew of hands picking, tractors turning under unharvested cotton, and planting equipment in operation in different portions of the same field.

In Texas the planting season was one of extremes. Central and eastern Texas were much too wet and some loss of acreage resulted from washing and floods. In northwest Texas, extreme drought prevailed throughout the normal planting season, with only partial relief in late June, and farmers there were prevented from planting their full intended acreage for the second consecutive season. In Arkansas and Oklahoma, excessive rains limited planting. In many other areas of the Belt, wet soils resulted in extensive replanting which exhausted the small supply of viable planting seed and held the acreage in check.

Abandonment of acreage in cultivation on July 1, 1946 amounted to 3 per cent, leaving 17,639,000 acres for harvest as compared with 17,059,000 acres in 1945. Abandonment was above average for the second consecutive year. Weather and severe weevil damage caused heavy abandonment of acreage in Mississippi and Louisiana and above-average abandonment in Texas, Oklahoma, Missouri, and Alabama. In other states, abandonment was mostly below average.

American-Egyptian cotton in cultivation on July 1, 1946 was estimated at 2,800 acres, less than half of the 1945 acreage and only 1.5 per cent of the peak of 193,000 acres grown in 1942. This drastic reduction was owing largely to the fact that premiums for American-Egyptian cotton have placed the production of this type of cotton at a disadvantage relative to the American upland varieties. Production of American-Egyptian cotton is more expensive and hazardous than is production of upland cotton. It is difficult to pick and yields less per acre.

COTTON YIELD

The 1946 lint yield of 230.7 pounds per harvested acre was lower than any year since 1936. It was 23 pounds less than the preceding year's yield and 13 pounds below the 1935-44 average but more than 50 pounds above the average for the 10-year period (1925-34). Yields in Mississippi and Louisiana were very poor, the Louisiana yield being only two pounds more than that of 1941 which was the smallest since 1923. On the other hand, the New Mexico yield of 584 pounds was larger by eight pounds than the previous record high of 1940. The Arkansas yield has been exceeded only once while that for South Carolina is the third highest on record.

COTTON PRODUCTION AND VALUE

Production of cotton in 1946 of 8,482,000 bales of 500 pounds gross weight was 533,000 bales, or 5.9 per cent less than the small crop of 1945, and about one-third smaller than the 1935-44 average. It was only 537,000 bales larger than the 1921 crop, and with this exception was the smallest crop since 1895. The 10-year average production was exceeded in two states; *i.e.*, California which was only 5,000 bales higher and New Mexico which produced a crop second in size to the bumper crop of 1937. About half of the states produced more cotton than in 1945 but the decreases in the remaining states more than offset the increases. Decreases in Mississippi and Louisiana were equal to about one-third of the 1945 production in those states.

The small crop was the result primarily of low level of acreage and unfavorable weather during the growing and fruiting seasons. Excessive rain and relatively low temperature stepped up the boll-weevil population, and damage was considerably above average, especially in Mississippi and Louisiana. Drought caused some damage in Oklahoma and Texas. Weather during the harvest season was mostly favorable except in Texas. In that state, October rains delayed harvest and caused some field losses. Although the crop was late in some areas, the percentage ginned to Dec. 1 was estimated at 88.5 per cent as compared with 83.8 per cent to this date a year ago and the 10-year average of 92.1 per cent.

Though the 1946 crop was much

[2] Included in state and United States totals. Grown principally in Arizona, New Mexico, and Texas.

smaller than in any recent year, the combined value of cotton and cottonseed of $1,685,103,000 was greater than for any crop since 1925, and 40 per cent higher than for the 1945 crop. This combined value is comprised of $1,438,569,000 for lint and $246,534,000 for cottonseed as computed at preliminary prices. The average price to Dec. 1, 1946 of lint of 33.9 cents per pound is 11.4 cents higher than in 1945 and is above the average received for any crop since 1919. The preliminary price of cottonseed at $71.40 per ton compares with $51.10 in 1945 and is well above the average for any of the 38 years of record. The value of cotton lint placed under government loan and unredeemed at the end of the crop marketing season is included in the above values at average prices. For the 1945 crop, 216,000 bales were placed under loan, of which about 170,000 bales had been redeemed by Aug. 1, 1946. Loans had been made on only 52,000 bales of the 1946 crop up to Dec. 1.

WHEAT

The third consecutive billion bushel wheat crop and the third consecutive record-breaking crop was harvested in 1946. Production totaled 1,155,715,000 bushels, 4 per cent more than in 1945. The spring wheat crop was larger than average but the smallest crop since 1942. The winter wheat crop, on the other hand, was the largest of record, resulting from a large acreage sown, low winter losses, remarkable recovery from the early season moisture shortage in the Great Plains, and an outstandingly good season in the Pacific Northwest.

Wheat supplies in the 1946-47 season are lower than in any of the previous five seasons, for the carry-over stocks were only about 101,000,000 bushels, smallest since the drought years. The supply, however, is still one-fourth larger than the 10-year pre-war average. In the 1945-46 season disappearance of wheat was the largest of record. Civilian and military food uses accounted for about 495,000,000 bushels, seed 82,000,000, alcohol 21,000,000, feed 320,000,000, and exports 382,000,000 bushels. In the current season, July 1, 1946 to June 30, 1947, requirements are estimated at 510,000,000 bushels for food, 82,000,000 for seed, none for alcohol, 180,000,000 for feed, 267,000,000 for export, which would leave carry-over stocks of about 218,000,000 bushels or more, depending upon imports.

Responding to the world need for food, growers planted 71,510,000 acres to wheat, the largest acreage since 1938. Of this, 67,201,000 acres were harvested, so that only 6 per cent of the seeded acreage was not harvested for grain. This compares with 69,130,000 acres seeded for the 1945 crop, 65,120,000 acres harvested and 5.8 per cent not harvested for grain. The huge wheat crop began to move to market fairly early from the Southwest. Storage facilities were nearly empty, and railroad equipment was mostly ample to move the grain so that at first there was little difficulty in handling the crop. As harvest progressed northward, however, transportation facilities became a limiting factor and quantities of grain had to be stored temporarily on the ground.

The leading states in all-wheat production in 1946 rank as follows: Kansas, North Dakota, Nebraska, Oklahoma, Washington, Texas, Montana, South Dakota, Ohio, and Colorado. These 10 states account for more than three-fourths of the total.

Wheat ranks second in value among United States crops. Valued at $2,134,019,000, the 1946 crop far exceeds in value the 1945 crop at $1,661,649,000. Value is computed at the preliminary season average price of $1.85 per bushel for the 1946 crop and at $1.50 for the 1945 crop. These season average prices are prices received by farmers for the portion of the wheat crop sold, usually 75 to 85 per cent of the total produced. Such prices are applied to the total production, to afford a measure of the relative importance of each crop in the agricultural economy.

WINTER WHEAT

The 1946 record production of 873,893,000 bushels of winter wheat cli-

[1] Yield of dry beans and peas is expressed as pounds per acre and production as thousand bags of 100 pounds each, uncleaned.
[2] The unit of yield and production of hay is tons.
[3] The unit of yield and production of popcorn is pounds of ear corn.

maxes three consecutive years of bumper winter-wheat crops. The 52,206,000 acres sown in the fall of 1945 were exceeded only by seedings in the falls of 1936 and 1937. Of this, 48,510,000 acres were harvested, an acreage exceeded only in 1919 and 1938. Abandonment was only 7.1 per cent of the planted acreage, compared with 6.8 per cent in 1945 and 6.9 per cent in 1942, but otherwise lower than in any other year since 1931 The yield per harvested acre was 18 bushels as compared with 17.4 in 1945 and the average of 15.9 bushels.

Winter wheat acreage was reduced from early intentions in the eastern Corn Belt and the Southeast because of delay in harvesting 1945 crops and wet fields at seeding time. An increased acreage was seeded under generally favorable soil-moisture conditions in the main winter wheat belt of the Great Plains and the Western states. In the Pacific Northwest, a favorable soil-moisture situation resulted in a marked shift to winter wheat from spring wheat. Winterkilling was light, and wheat came out of the dormant period in good condition. Light precipitation in the western Great Plains area, together with depletion of soil moisture by early spring growth, caused sharp deterioration of the crop in Texas, Oklahoma Kansas, and Nebraska before rains came in late May. Conditions from mid-May to harvest were favorable for developing and maturing the crop, so that, though a considerable acreage had headed short, the heads filled well with grain of high-test weight Harvest was completed a week or more earlier than usual.

More than three-fifths of the total winter wheat was planted and harvested in Kansas, Oklahoma, Texas, and Nebraska. Kansas alone accounted for more than one-fourth of the total acreage and nearly one-fourth of the total production. The 12 leading states in winter wheat production ranked as follows in 1946: Kansas, Nebraska, Oklahoma, Washington, Texas, Ohio, Colorado, Montana, Indiana, Michigan, Idaho, Oregon, ranging from 217,000,000 down to 20,000,000 bushels.

SPRING WHEAT

Production of 281,822,000 bushels of spring wheat in 1946, the smallest since 1942, includes 35,836,000 bushels of durum and 245,986,000 bushels of other spring wheat. Durum wheat was harvested from 2,453,000 acres, an increase of 22 per cent over the 1945 acreage. A large part of this acreage was in an area that was too dry during the early part of the growing season, but the crop rallied well when needed moisture fell. The yield of 14.6 bushels per acre was 1.8 bushels below that of 1945, but 1.7 bushels above average. Other spring wheat acreage was less severely affected by the dry spring, as it is more widely dispersed than the durum acreage. The yield of 15.1 bushels was 0.9 bushel below that of 1945, but 1.1 bushels above average. Even though the acreage was slightly larger than that of 1945, production was lower than in 1945, but considerably above average. The harvesting season was mostly favorable, so that harvesting loss was at a minimum, and the grain was of high quality.

RYE

Rye production in 1946, at 18,685,000 bushels, reached the lowest point since 1875, with the exception of the drought year 1934. It was less than half of the 1935-44 average. Both the acreage harvested and the yield per acre were relatively low. Freezing weather during May and dry weather during most of June adversely affected development of heads in some areas, especially in Nebraska, North Dakota, and South Dakota.

Of the 3.390.000 acres sown in the fall of 1946, about 47 per cent, or 1,598,000 acres, was harvested for grain. In 1945, about 45 per cent, or 1,856,000 acres, was harvested for grain. A considerable acreage is ordinarily sown for pasture, for hay, and for soil-conserving purposes. With relatively small acreage and production in North Dakota, South Dakota, and Minnesota, formerly leaders in rye production, Nebraska retained the position attained in 1945 as the leading rye-producing state. At the preliminary season average price of $1.90 per bushel, the value of 1946 production was $35,421,000, exceeding the much larger crop of 1945 valued at $1.35 per bushel and a total of $32,380,000.

Rye stocks in all positions on July 1, 1946 were only 2,387,000 bushels, an extremely low level. These, with the new crop, provide a supply for the 1946-47 season of only 21,072,000 bushels, slightly more than half the supply for the 1945-46 crop year and the smallest in 65 years. With such small supplies, all domestic uses other than seed will be greatly curtailed and exports kept very small, despite demand from abroad for food. Last year about 6,700,000 bushels of rye were used for food, 11,600,000 bushels for feed, 4,900,000 for seed, 8,300,000 for alcohol and spirits, and 7,200,000 bushels exported. A 5 per cent increase in seedings in the fall of 1946, for 1947 harvest, with large increases in states which harvest a large percentage for grain, marks the first time in four years that the acreage has been increased over the previous year.

RICE

Rice production continues to expand, with that of 1946 setting a new record of 71,520,000 bushels. This is 5 per cent more than in 1945 and 29 per cent above average. This increased production resulted entirely from the largest acreage ever harvested, as the average yield per acre was the same as a year ago and two bushels below average.

Plantings in 1946 reached the record total of 1,584,000 acres, despite extremely unfavorable weather throughout the rice area of the South. Of this, 1,567,000 acres were harvested, with an average yield of 45.6 bushels. The southern area produced 54,792,000 bushels in 1946, slightly more than in 1945, even though spring rains hindered seeding operations and much of the acreage was later than usual Though the growing season was generally favorable, some of these late plantings failed to overcome this handicap, resulting in below-average yields. The early part of the harvest season was favorable, and this, coupled with increased use of combines, resulted in completing harvest earlier than usual. California produced 16,728,000 bushels, by far its largest crop. Fall weather was nearly ideal for harvest, so that the work proceeded rapidly and with negligible loss. Yields averaged 7.5 bushels per acre more than in 1945. At the preliminary season-average price of $2.14 per bushel, the 1946 crop is valued at $153,257,000, compared with $1.79 and $122,190,000 in 1945.

BUCKWHEAT

A crop of 7,105,000 bushels of buckwheat, only slightly below average and 7 per cent larger than in 1945, was harvested in 1946. The planted acreage was the smallest since 1942, as the season was favorable for planting other grains, holding down the seeding of buckwheat, which is used as a catch-crop in many areas. Abandonment was about average, with acreage losses heaviest in New York, Pennsylvania, Michigan, and Minnesota. Of the 415,000 acres seeded, 390,000 were harvested, compared with an average of 424,000 acres harvested. Yields averaged 18.2 bushels per acre as the result of a favorable season, two bushels more than in 1945 and 1.4 bushels above average. At the preliminary season-average price of $1.46 per bushel, the value of the 1946 buckwheat crop is $10,395,000, well above the $1.19 per bushel and total of $7,875,000 for the 1945 production.

FEED GRAINS

The largest tonnage in history of the four feed grains—corn, oats, barley, and sorghum grain—was produced in 1946. The total of 125,529,000 tons exceeds by about 2½ per cent the previous record of 122,566,000 tons produced in 1942 and by 10 per cent the 1945 total. It is about a quarter larger than the average for the predrought period, despite the larger acreages of those earlier years. Contributing the major part to this tonnage was the largest corn crop ever produced, along with the second largest oats crop, an above-average crop of sorghum grain, but a smaller than average crop of barley.

Commercial users of feed grains require only a relatively small proportion of total production. The quantity of corn used on farms where grown may be three to four times as large as the quantity sold from the farms, and even then much of that sold goes to other farmers and livestock feeders. Thus by far the greater proportion of the total feed-grain supply is fed on farms. Farmers derive the greater part of their income from their feed-grain production by way of the livestock to which they feed these grains, in their sales of dairy and poultry products, meat animals, wool, and other byproducts. Current production, plus the relatively small carry-over of all grains except oats, assures the most liberal supply in history of feed grains per animal unit. The 1946 production was generally of such excellent quality that it will be much more efficient in feeding value than the supply of the preceding season when much of the corn was "soft."

Carry-over stocks of corn on Oct. 1, 1946 were by far the lowest in the four years for which such information is available. Stocks of oats were by far the largest for any July 1 of record, more than offsetting the very light stocks of barley. The large supply of feed grains (production plus carry-over) will undoubtedly reduce the quantities of wheat and rye fed this season.

CORN

The nation's largest corn crop and one of the best from the standpoint of quality resulted from the favorable 1946 season. The total of 3,287,927,000 bushels was harvested from 88,718,000 acres, at a record yield of 37.1 bushels per acre. This total exceeds the previous high mark set in 1944 by about 85,000,000 bushels and is more than one-fourth larger than the average crop. More than the usual proportion, 2,989,887,000 bushels, or 91 per cent of all corn, was harvested as grain, the remainder being the allowance for corn utilized as silage and fodder or hogged and grazed.

In only five of the last 50 years, 1898, 1939, 1940, 1941, and 1945, has the harvested acreage of corn been smaller than in 1946. The 90,027,000 acres planted was also relatively small, and abandonment at 1.5 per cent was relatively low, but the average yield per acre was nearly two bushels above the previous high point of 1942 and 8.6 bushels above average. Hybrids, planted on 67.5 per cent of the total acreage and on 91 per cent of the high-yielding Corn Belt acreage, were a major factor influencing the higher yields. The long and favorable growing season resulted in excellent quality and steadily improving yield prospects.

Overcoming most of the early obstacles by July 1, the corn crop gave promise of breaking all production records. Planting had been delayed by frequent rains during the latter part of May in the Ohio River Valley and most of the country outside the main Corn Belt. In most of the Corn Belt, especially in the western part, planting conditions were nearly ideal, although the excellent conditions for seeding spring grains and the light abandonment of winter wheat had left a smaller acreage available for corn than farmers had originally planned. Favorable weather in late June and most of July improved prospects, but dry weather in late July and August affected yield prospects in the Great Plains, the northern Lake States and scattered parts of the West. By Oct. 1, it was apparent that the crop would be of excellent quality, as September growing conditions were mostly favorable and frosts had done but little damage. Yields per acre were above average in all states except Maine, Michigan, Louisiana, Montana, Idaho, and California. New production records were set in Iowa, Illinois, Indiana, and North Carolina, with numerous other states at near-record levels.

Corn continues to be the leading crop of this country. Measuring the value of all corn by the price received by farmers for the quantity they sold, the value of 1946 production was $4,462,512,000 at the season-average price of $1.36 per bushel. In 1945, the crop was worth $3,670,557,000 at $1.27 per bushel.

Stocks of corn in all positions Oct. 1, 1946 were about 178,000,000 bushels, which, with the new production of grain corn, adds to a supply of about 3,168,000,000 bushels. A year earlier stocks were about 325,000,000 bushels and the supply 2,919,000,000 bushels. On Oct. 1, 1944, stocks were 235,000,000 bushels and the total supply 3,116,000,000 bushels of grain corn.

OATS

The second consecutive 1,500,000,000-bushel oats crop was harvested in 1946. The production of 1,509,867,000 bushels is only about 26,000,000 bushels or 1.7 per cent below the record 1945 crop. It was harvested from 43,648,000 acres, with an average yield of 34.6 bushels per acre. The acreage was 4 per cent more than in 1945 and nearly one-fifth above average, but the yield was about two bushels below that of 1945, though far above average.

An early spring season was favorable for seeding increased acreages in north Central States where three-fourths of the acreage is located in north Atlantic States. The tight feed situation, upward trends in yields in recent years, and relatively light labor requirements for producing oats were other factors in the increase, but in the South, where oats are mostly fall-sown, the wet fall of 1945 was unfavorable for seeding. The growing season was highly favorable for oats generally, and harvesting losses were light. Relatively good yields and test weights resulted, although disease appearing in some of the new high-yielding varieties tended to limit yields. Abandonment, including diversion to uses other than as grain, was only 7.2 per cent of the planted acreage, compared with 8.6 per cent in 1945.

The 1946 oats crop has a value of $1,195,011,000 at the preliminary season average price of 79.1 cents per bushel. The 1945 crop, at 66.7 cents per bushel, was valued at $1,024,799,000. Oats thus rank fifth in value among the 1946 crops.

Carry-over stocks of oats on July 1, 1946 amounted to about 295,000,000 bushels, which, added to the new crop, makes the supply for the 1946-47 season about 1,805,000,000 bushels. Supplies for the 1945-46 season amounted to about 1,772,000,000 bushels, including about 236,000,000 bushels of carry-over stocks. In no other year had supplies ever reached such high levels.

BARLEY

Production of barley declined in 1946 for the fourth consecutive year, to 263,350,000 bushels. This is only 1 per cent below the 1945 crop, but 9 per cent below average. The downward trend in barley acreage, which began after the 1942 peak, largely accounts for the recent small crops. The yield of 25.1 bushels per acre was satisfactory, only slightly below 1945, but 2.3 bushels above average.

The 11,594,000 acres planted to barley in 1946 was only three-fifths of that planted in the first year of the war. Of this, 10,477,000 acres were harvested. In some of the major producing states, however, the downward trend in acreage was reversed this season. The north Central States, which grow well over half of the barley acreage, harvested 5 per cent more acres than in 1945. The north Atlantic States harvested 9 per cent more acres than in 1945, but in most other parts of the country, particularly the South and with Montana excepted, acreage of barley continued to decline with the increase in oats. At the preliminary season-average price of $1.34 per bushel, the 1946 barley crop is worth $353,645,000, compared with $1.02 and $271,460,000 for the 1945 crop.

Stocks of barley in all positions on July 1, 1946 were less than 59,000,000 bushels, which, with the new crop, made the supply for the 1946-47 season about 322,000,000 bushels. A year earlier the stocks were 96,000,000 bushels and the supply 363,000,000 bushels, while on July 1, 1944 the supply was 354,000,000 bushels, and on July 1, 1943 it was 445,000,000 bushels.

SORGHUM GRAIN

About 106,737,000 bushels of sorghum grain were produced in 1946, 10 per cent more than in 1945 and substantially above average. This total is not greatly different from the fairly large crops of 1941, 1942, and 1943, but is 41 per cent below the record crop of 1944.

Sorghums were planted later than usual because of unfavorable moisture conditions during the usual planting season. Growth was retarded by drought conditions and high temperatures during July and August, until rains in late August and early September brought significant improvement. Favorable fall growing conditions and later than usual frosts permitted grain to mature on much of the late planted acreage, which otherwise would have produced only forage. The 6,765,000 acres harvested for grain were 6 per cent more than in 1945 and constituted 49 per cent of the acreage harvested for all purposes, compared with 43 per cent in 1945.

Sorghum grain production is heavily concentrated in the southern and central Great Plains states, with Texas producing in 1946 about 69 per cent of the total, Kansas 11 per cent, and Oklahoma 7 per cent. In addition to the grain, about 8,619,000 tons of forage and 3,701,000 tons of silage were produced on the acreage not harvested for grain. About 13,838,000 acres of sorghum were harvested for all purposes, including grain, silage, forage, and 179,000 acres for syrup.

Using the preliminary season average price received by farmers to evaluate the crop, the 1946 production of sorghum grain at $1.39 per bushel is worth $148,239,000, compared with $1.19 and $115,816,000 in 1945.

HAY

The importance of hay among the country's field crops may be gauged by its value, which is usually exceeded only by corn and wheat. In 1944, hay ranked second in value. The 1946 hay crop amounted to 100,860,000 tons, about 7 per cent less than in 1945. This was harvested from 74,352,000 acres. The season was favorable for hay, although May freezes in northern Great Plains states and a dry summer in the Lake states limited yields. Quality is generally good. Making up the total production were about 34,000,000 tons of clover-timothy hay, 32,000.000 of alfalfa, 12,000,000 of wild hay, 7,000,000 of lespedeza, 4,000.000 of soybean, cowpea, and peanut hay, 3,000.000 of grain hay, and 9,000,000 tons of miscellaneous hays. Hay is grown in all sections, but the kinds vary according to those best suited to the section.

At the preliminary season average price of $17.30 per ton, the 1946 hay crop is valued at $1,748,748.000, compared with $15.20 and $1,650.132,000 in 1945. The total hay supply, including carry-over from previous crops, was about 117,000,000 tons, slightly less than for the 1945-46 season but one-seventh more than average. With reduced livestock numbers the supply per animal unit is the most liberal on record.

DRY BEANS

Nearly an average crop of dry beans was produced in 1946, about 15,797,000 bags uncleaned, equivalent to about 14,750,000 bags cleaned. Although this is about 5,000,000 bags below the wartime peak of 1943, it is one-fifth more than the small crop of 1945. About 1,698,000 acres of beans were planted, the loss in acreage was relatively light, and 1,617.000 acres were harvested. The yield of 977 pounds per acre is well above average. The season was nearly ideal in New York, a very dry season in Michigan limited yields, but a late fall enabled growers to harvest beans with a minimum of loss. The season was generally good elsewhere. At $11.30 per 100-pound bag the 1946 crop of dry beans is valued at $166,100.000 compared with $6.55 and $78,348,000 in 1945.

SOYBEANS

The wartime expansion of the soybean crop continued so that in 1946 a new production record was set at 196,725,000 bushels harvested for beans. This is nearly double the average. In 1941, production was only a little over 105,500,000 bushels. The 1946 acreage harvested for beans is the smallest since 1941, but the yield of 20.5 bushels per acre was exceeded only in 1939, and is 2.5 bushels above average.

The season from planting time through harvest was favorable for soybeans. Planting was accomplished with but little delay. The growing season was dry in the area adjacent to Lakes Michigan and Erie, but was exceptionally good in most other areas. Killing frosts held off long beyond the usual date, enabling plants to reach full maturity, and harvest was completed quickly with slight losses. Beans are of high quality and low moisture content.

The 1946 soybean crop, at the preliminary season average price of $2.63 per bushel, is valued at $516,917,000. In 1945 the value was $399,698,000 at $2.08 per bushel.

Stocks of soybeans on Oct. 1, 1946 were only about 4,345,000 bushels, as processors drew heavily on the supply with the new crop large, of good quality, becoming available at an early date. This made the supply for the 1946-47 season about 201,000.000 bushels, compared with about 200,000,000 bushels, including stocks of 7,741,000 bushels, on Oct. 1, 1945. Of that supply about 159,000,000 bushels were processed for oil.

OTHER OILSEEDS

Oilseeds totaling over 11,000,000 tons were produced in 1946, only 3 per cent less than in 1945 and one-eighth more than average. Smaller than usual tonnages of cottonseed and flaxseed, but a record tonnage of soybeans and near-record crop of peanuts, make up the total. The cotton and cottonseed crop, except for that of 1921, is the smallest since 1895. Flax was harvested from only about two-thirds as large an acreage as in 1945. The dry planting season in the main flax area of the northern Great Plains and competition by wheat for use of the land reduced seedings. Yields averaged 9.4 bushels per acre, better than in 1945 and average. The peanut crop of 2,075,880,000 pounds was the fifth consecutive crop to top 2,000,000,000 pounds and is nearly double the average before 1941.

Flaxseed valued at $4.24 per bushel and total of $97,360,000 nearly equals in value the much larger 1945 crop at $2.89 per bushel and total of $99,912,000. Cottonseed at $71.40 per ton and total of $246,534,000 in 1946 is worth more than the slightly larger 1945 crop at $51.10 per ton and total of $187,155,000. Peanuts were valued at 9.32 cents per pound and total of $193,413,000 in 1946, compared with 8.27 cents and $168,878,000 in 1945. The four oilseeds, including soybeans, totaled $1,054,224,000 in value in 1946 and $855,643,000 in 1945.

SEED CROPS

Record or near-record production was achieved in 1946 for nine out of 26 kinds of seed crops—alfalfa, red clover, lespedeza, white clover, orchard grass, blue lupine, purple vetch, common ryegrass, and perennial ryegrass. Production of 14 kinds exceeded that of 1945. In the hay seed group, the large crops were particularly timely in the cases of alfalfa and red clover because these are the leading hay crops used in the northern half of the country. Acreage and poundage payments for producing seed, offered to growers by the Government, were chiefly responsible for harvesting record acreages of alfalfa and red clover. Weather conditions for harvesting the majority of seed in 1946 were more favorable than in 1945, with the result that yields were larger and quality of seed was better. Harvesting of seed crops began earlier in 1946 than in 1945, and was interrupted very little by unsettled weather. Movement of seed from farms was faster in 1946 than usual and at prices well above average.

The aggregate production in 1946 of the 26 kinds of legume, grass, and winter cover crop seeds was 761,500,000 pounds of clean seed, with a farm value of $146,500,000. This compares with 670,700,000 pounds produced in 1945, and a value of $114,100,000.

The 1946 production of alfalfa seed

SEED CROPS—UNITED STATES

Kind of Seed	Acreage Harvested			Yield per Acre			Production		
	Average 1935–44	1945	1946	Average 1935–44	1945	1946	Average 1935–44	1945	1946

---

[1] Yield in pounds and production in thousand pounds.
[2] Short-time average.
[3] Acres and yield not estimated because most of production cleaned out of other crops.
[4] Sudan grass is on a thresher-run basis.

(thresher-run) was 9 per cent larger than the previous record established in 1939, 40 per cent larger than the 1945 production, and 41 per cent above the 1935-44 average. A record acreage was harvested in 1946.

Production of red clover seed in 1946 was about equal to the record of 2,113,600 bushels in 1929. Production in 12 out of 18 states was larger in 1946 than in 1945. The 1946 acreage is the largest ever harvested and twice the 10-year average of 1,291,950 acres.

An increase of 11 per cent over 1945 and 28 per cent over the average is indicated for the 1946 crop of alsike clover seed. The increase over 1945 was owing to larger yields. Production in seven of 11 states exceeded that of 1945.

A crop of sweetclover seed 2 per cent above 1945 is attributed entirely to a slightly larger yield per acre which more than offset the small reduction in acreage harvested.

Increases of 6 per cent in acreage and 8 per cent in yield per acre accounted for the 14 per cent larger production of lespedeza seed in 1946 than in 1945. With minor exceptions, production in the northern producing states was larger than in 1945, whereas the 1946 production was smaller in the southern producing states.

Production of timothy seed 5 per cent larger than in 1945 is attributed to small increases in acreage and yield. Production in five out of eight states was larger than in 1945, with increases largest in Indiana and Ohio.

Production of redtop seed in Illinois and Missouri in 1946 was 28 per cent below the 1945 production. Heavy rains just before and during harvest in Illinois decreased yields and caused some reduction in the acreage harvested for seed.

On the smallest acreage of record (since 1929), production of Sudangrass seed in 1946 fell 21 per cent below the very small crop of 1945. Smaller crops than in 1945 were harvested in six out of the eight producing states.

THE DAIRY INDUSTRY

By Herbert C. Kriesel
Bureau of Agricultural Economics, Department of Agriculture

GENERAL

The year 1946 saw the dairy industry undergo substantial adjustments toward a peacetime basis. Price controls were in effect through the first half of 1946, and some supply controls were invoked during the first six months of the year in order to fill urgent foreign relief requirements, but, by the year-end, the dairy industry had reverted almost completely to a pre-war status, as far as pricing and distributing were concerned. Dairy prices did not rise sufficiently to offset immediately the suspension of subsidies following the suspension of price controls in mid-year, but production on farms apparently was little affected by the failure of prices to advance at once.

Under the influence of favorable unit returns, including government payments and pasture conditions well above average, milk production per cow reached a new high record. This higher rate partly offset a reduction in cow numbers. Total milk output was the highest on record except for 1945. With record consumption of fluid milk and cream and ice cream through much of 1946 and with a slightly smaller total milk supply, output of other manufactured products using butterfat declined sharply from the 1945 levels. Supplies of many manufactured dairy products were considerably short of demand through the first half of 1946, but such market shortages disappeared with the suspension of price controls and the resumption of free pricing in the dairy industry.

MILK PRODUCTION

The number of milk cows in the United States has been increasing generally with the population, but the number of people has increased somewhat more rapidly. In the late 1800's the United States had one cow for every four people, but with increased output of milk per cow, demands for milk have been met in recent years with one cow for every five or more persons. Production of milk per cow has climbed, and the increase in total output of milk has been closely in line with increases in population. Since 1940, however, the increase in milk production has been greater than the population increase.

Only two previous major downturns in milk cow numbers have occurred since 1867. These reductions followed the peaks of 1925 and 1934. The reduction in 1934 was much the greater of the two previous declines and was associated with the drought of the middle 1930's. Following the low point in cow numbers in 1938, numbers increased fairly rapidly. Expanded output of milk was made possible by greater supplies of feed concentrates, improved pastures, and increased roughage supplies. Widespread soil conservation, other improved practices, and ample moisture aided in these increases. By the time the United States entered the Second World War, the number of cows on farms had almost regained the losses suffered during 1934-38. The number continued to increase until the middle or latter part of 1944, but since then, the net removal of cows from dairy herds has been at a faster rate than at any previous time. This decline occurred despite comparatively large feed supplies per unit and unit returns (prices plus subsidies) for dairy products above average in relation to feed prices, particularly in 1945. It appears that farm labor shortages and favorable returns from alternative enterprises have been more influential than usual in causing dairymen to reduce the size of their herds.

The effects on milk production of the reduction in cow numbers during 1946 as compared with 1945 was partly offset by a further increase in rate of output per cow. The 1946 average rate was around 4,875 pounds, 2 per cent above the previous record reached in 1945 and 11 per cent above the pre-war average. Some short-term factors which contributed to the high rate per cow during 1946 were: (1) in the reduction of cow numbers in the year the poorer cows were taken out of production; (2) pastures were well above average during the 1946 season; (3) liberal quantities of concentrates were fed dairy cows; (4) the proportion of milk cows actually milked averaged higher in 1946 than in 1945. There is some evidence that this proportion will increase further with the improvement in the farm labor supply. Besides the effects of the short-time influences, milk production per cow in 1946 no doubt was affected by continuation of some long-time developments. These consist of improvements in (1) methods of feeding, (2) in breeding through use of artificial insemination methods and dairy herd improvement associations, and (3) in management of dairy cows.

Total milk production in 1946 was about 119,500,000,000 pounds compared with the previous record of 122,200,000.000 pounds reached in 1945 and the 1935-39 average of 103,000,000,000 pounds.

PRICES OF DAIRY PRODUCTS

The demand for dairy products at prevailing ceiling prices exceeded available supplies by a considerable margin through June 1946. Consequently, when price ceilings lapsed at the end of June, prices of dairy products increased more sharply than at any previous time and soon more than offset the suspension of subsidy payments. The strong consumer demand for dairy products was supplemented during the third and fourth quarters of 1946 by demands from manufacturers and distributors to replenish and maintain stocks of manufactured products. Retail prices of dairy products in October were 37 per cent higher than in June 1946, 48 per cent higher than in January, and 52 per cent higher than in October 1945. Retail prices of butter, cheese, and fresh milk by the end of 1946 exceeded the highest levels reached in the period of the First World War, but prices of evaporated milk had not reached previous record levels. Prices received by farmers for dairy products in October, allowing for seasonal variation, were 9 per cent higher than unit returns (prices plus subsidies) in June and 22 per cent higher than in January. The index of prices received by farmers for all dairy items sold in 1946 averaged about 235 per cent of the 1910-14 average compared with 197 per cent in 1945 and the 1935-39 average of 119 per cent.

FARM INCOME FROM DAIRY PRODUCTS

Increases in unit returns to farmers for dairy products sold in 1946 more than offset the slight decline in volume, and cash income from dairy products increased to a new record level. Cash receipts for marketings during 1946 totaled $3,600.000,000. In addition, farmers received about $280,000,000 in production payments, making total cash receipts for 1946 nearly $3,900,000,000. This was 2¾ times the 1935-39 average cash receipt and compares with $3.600,000,000 received in 1945. The value of milk, cream, and butter consumed on farms during 1946 was around $700,000,000. Thus, gross farm income from the dairy enterprise was about $4,500,000,000 in 1946. As has been the case, every year since 1919, except 1941 and 1942, milk and milk products provided the largest single source of cash for farm receipts.

A substantial part of the increase in cash receipts from dairy products in 1946 over pre-war was accounted for by a shifting of the method of sale of milk from cream to whole milk. The latter provides cash outlet for the non-fat solids of milk and in almost all instances affords higher unit returns per unit of butterfat sold. In 1946, sales of whole milk constituted about 75 per cent of the milk equivalent of milk and cream delivered at wholesale. The 1935-39 average was only 57 per cent. In 1946 farmers received nearly $250,000,000 more for their milk and cream sold in the proportions which prevailed than they would have received if the 1935-39 ratios had continued. This increase is an average of around $50 for all dairy farms of the nation, and for the dairy farmers who actually made most of the shift it probably was equivalent to several hundred dollars per farm.

For 1946, specific price supports on dairy products were not announced as they had been in some previous years. The only support commitment in effect was that of the Steagall Amendment to the Price Stabilization Act which provides that if funds are available the price of whole milk and butterfat received by farmers shall be supported at not less than 90 per cent of parity for two years following the Jan. 1 after hostilities have been declared at an end. Unit returns for both items during 1946 exceeded parity by 25 per cent or more.

REINSTATEMENT OF WARTIME GOVERNMENT SUPPLY CONTROLS

During the war, milk was channeled to the most desired use by application of government limitation, reservation, allocation, and rationing orders. Reservation orders required the setting aside of a part of the output or stocks for sale to government agencies. Limitation orders restricted production and sales of certain products. Allocation orders required users to apply for permission to use a specified quantity of products. Rationing was a form of allocation applied to a large number of individual consumers, and for dairy products was not renewed in 1946 after being suspended in late 1945. To obtain sufficient quantities for export demand, reservation orders were reinstated during the first half of 1946 for cheese, butter, non-fat dry milk solids, and, for the first time in the war emergency, were instituted for evaporated milk. By the end of June, when price controls were suspended, adequate supplies of most dairy products had been contracted for delivery to the

Government. In July and August all allocation orders were suspended. On July 1, however, an order limiting the fat content of cream for fluid distribution was invoked, and continued in effect until Nov. 20. By the end of 1946, the dairy industry was free of all supply controls except as it was affected by sugar allocations and export-import licensing.

RECORD FLUID MILK CONSUMPTION

Price ceilings on fluid milk and cream during the war permitted consumers to increase greatly their consumption of this product without raising their expenditures much above average in relation to their incomes. Wartime controls on distributors' volume of fluid milk and on the fat content of fluid cream prevented an even more rapid increase in expeditures`for these items. Thus, with the suspension of these supply controls in September 1945, continuation of price ceilings and high consumer incomes, a further increase in consumption occurred. Per capita consumption of fluid milk and cream from mid-1945 to mid-1946 apparently was around 455 pounds per person compared with the 1935-39 average of 340 pounds.

Following the reimposition on July 1, 1946 of a government order, limiting to 19 per cent the fat content of cream for fluid distribution, and the price increases after July 1, 1946, consumption of fluid milk and cream apparently declined, but for 1946 as a whole, consumption was close to the previous record of 438 pounds reached in 1945. Total consumption of fluid milk and cream in the United States during 1946 was 60,000,000,000 pounds or approximately 52 per cent of the total production. In 1935-39 only 43 per cent of total milk production was consumed in fluid form. Ice cream consumption increased sharply after the lifting of the limitation order in September 1945, and in the first half of 1946 averaged 85 per cent greater than in the comparable period of 1945.

The high level of consumption of fluid milk, cream, and ice cream during 1946, and slightly smaller production of milk on farms, resulted in a substantial reduction in the quantity of milk available for other manufactured products containing butterfat. The whole milk equivalent (fats solids basis) of milk used in manufactured products other than ice cream in 1946 was 42,000,000,000 pounds compared with 49,000,000,000 pounds in 1945, and the 1935-39 average of 46,000,000,000 pounds.

CREAMERY BUTTER PRODUCTION

The decline in output of butter accounted for much of the reduction in total output of manufactured dairy products during 1946. Butter production declined during and since the Second World War much as it did during and after the First World War. In both instances, this reflected a less rapid increase in supply of than in demand for fluid milk and some other milk products. Production of butter, the residual claimant on available supplies of butterfat, inevitably declined. In the four years 1917-20, consumption of butter averaged 14.9 pounds per person compared with the 1910-14 average of 17.4 pounds. From 1919 to 1920, the second year following the end of the First World War, butter consumption declined a half pound per person. Beginning with the slackening of consumer demands in 1921-22, more butterfat went into butter, and in subsequent years consumption increased substantially over the 1920 level. However, from the middle 1920's to the outbreak of the Second World War, butter consumption fell off slowly. The average in 1935-39 was 16.7 pounds compared with 18.1 pounds in 1923-27 when the average was the highest for any five consecutive years on record.

Sharply increased demands for whole milk items containing butterfat resulted in decreasing butter production before price controls were established in 1942, despite increasing milk production. With the imposition of price controls on butter and other products in late 1942, and with continued strong demands for milk in other forms, butter production was reduced further, reaching a record low in 1946. In the second half of 1946, reflecting a decrease in consumption of fluid milk and cream, the annual rate of butter production increased. Output of creamery butter for 1946 totaled less than 1,150,000,000 pounds compared with 1,361,000,000 pounds in 1945 and the pre-war 1935-39 average of 1,691,000,000 pounds.

Production of American Cheddar cheese in 1946 was 1,050,000,000 pounds compared with 1,115,000,000 pounds in 1945 and the pre-war average of 669,000,000, pounds. Production of condensed and evaporated milk in 1946 was around 3,300,000,000 pounds, a decline of 23 per cent from the record high in 1945 but 50 per cent above the pre-war average. Dry whole milk production in 1946 was approximately 175,000,000 pounds, somewhat less than the record of 219,000,000 pounds in 1945, but nearly 10 times the 1935-39 average of 19,000,000 pounds. The output of non-fat dry milk solids for human consumption in 1946 about equaled the previous record of 632,000,000 pounds reached in 1945 and was more than twice the 243,000,000 pounds in 1935-39.

EXPORTS OF DAIRY PRODUCTS

The proportion of domestic production that was exported during and since the Second World War varied considerably among manufactured dairy products. The largest proportion of domestic output was exported in the case of dry milks, both non-fat dry solids and whole milk. Condensed and evaporated milk and cheese were next in importance and a very small amount of butter was exported. The total quantity of dairy products exported during 1946 was 5,600,000,000 pounds, whole milk equivalent, about 4 per cent of production, compared with the pre-war average of a little over one-third of a billion pounds. Between the two wars the United States was a net importer of dairy products, largely because of relatively heavy imports of cheese.

DOMESTIC CONSUMPTION OF TOTAL DAIRY PRODUCTS

Although total foreign shipments of dairy products during 1946 were at near record levels, purchases from current production during the year were smaller than in 1945 and some previous years, since large quantities of several items were transferred from the armed forces late in 1945 and early in 1946. Thus, civilian per capita consumption in the United States equaled or exceeded previous years for all major dairy items except butter. Per capita consumption of butter in 1946 was 10 pounds compared with 16.7 pounds in 1935-39. The decrease in consumption of butterfat in the form of butter was about offset by the increase in consumption of butterfat in fluid milk, cream, and ice cream. Consumption per person of all milk products during 1946, measured on a fats solids basis, was about equal to the 1935-39 average, but because of increased human consumption of non-fat milk solids, consumption of all milk products per person, measured on a non-fat solids basis, was nearly 30 per cent larger than the 1935-39 average.

INSECT PESTS AND PLANT QUARANTINES

By P. N. Annand

Chief, Bureau of Entomology and Plant Quarantine,
Department of Agriculture

GENERAL

The further development of new insecticidal materials and improvements in equipment and methods for their application have continued to receive major emphasis. Extensive experimentation has been carried on to determine the usefulness of new materials that show promise for the control of agricultural pests, as well as those affecting the health of man and animals and those injurious to stored products and in the home. Advancements have also been made in methods and equipment for applying insecticides and fumigants. Many of the developments resulting from research have been applied to large-scale insect control projects carried on in cooperation with state and other agencies. Some have also aided in simplifying and improving methods used in certifying materials and products that require treatment in order to move under plant quarantine regulations. The constant increase of air transportation continues to create problems in protecting the country from importations of new insect pests and plant diseases and in preventing the spread of those already established in limited areas.

INSECTICIDE DEVELOPMENTS AND METHODS OF APPLICATION

Extensive experimentation has been continued to determine practical and safe uses of various formulations containing DDT. Except against household insects and direct pests of man and animals, such as flies and mosquitoes, few definite recommendations for its use have been made. Further tests with benzene hexachloride disclose that it has shown special promise for use against cotton insects, and encouraging results against many other insects. Preliminary tests of the new insecticide designated as "1068" (a chlorinated hydrocarbon) showed it to be more toxic than DDT to some insects and less toxic to others. Chlorinated bicyclic terpene was found to equal DDT in toxicity to some household and crop insects, showing sufficient promise to warrant recommendation for field testing.

Marked progress has been made in the development of mist blowers for applying concentrated sprays from the ground. Many practical tests of the dispersion of sprays from aircraft have also been undertaken, involving the use of various types of equipment, spray formulas, and dosages against insect pests of cotton, forests, and field crops.

Cooperative work on the use of aerosols in the control of insects on vegetable crops was continued. DDT was used with various solvents and propellents. Mixtures that do not injure plants were developed for field and greenhouse use, and apparatus for applying such aerosols were tested against thrips, aphids, and leafhoppers. Methyl chloride as the propellent is being replaced by mixtures of Freon-11 and Freon-12 because of their lower toxicity to man. Work on the development of aerosol formulas and equipment for use on aircraft is in progress in cooperation with the United States Public Health Service. The use of lower pressure aerosols is also being studied.

FUMIGATION METHODS

The study of factors governing tolerance of nursery plants to methyl bromide fumigation was continued in connection with treatments for products regulated under the white-fringed beetle quarantine. A new project to develop treatments for bulk cottonseed and other products regulated by the pink bollworm quarantine was begun. Continued work on hydrocyanic acid fumigation of the California red scale on citrus confirmed previous conclusions that the gastight tent requires only about one third as much fumigant to achieve effective controls as does the standard duck tent. The design of the blower applicator developed by the Bureau of Entomology and Plant Quarantine has been modified to facilitate handling in the field.

INSECT REPELLENTS

Screening tests of more than 7,500 chemicals as mosquito repellents for skin applications were completed during the year, and eight chemicals have been found to give over five hours' protection against the bites of yellow-fever mosquitoes. These materials are now being tested for their toxicity to man before they are recommended for use. Screening tests of chemicals for use as miticides were also completed and 229 were shown to be equal or superior to benzyl benzoate in toxicity to mite larvae. Two of these materials, when impregnated in clothing, remained effective after seven to 11 washings, whereas benzyl benzoate failed after two to four washings.

SCREWWORMS

The screwworm survey, which has served well to determine the needs of critical ingredients for Smear 62 and to acquaint the livestock industry with the superiority of this remedy for the control of screwworms, was continued. With the cooperation of state personnel, Smear 62 has been introduced in all the affected states, and livestock owners have saved many valuable animals and prevented many local outbreaks and further spread of the screwworm. Research has been continued to develop substitutes for diphenylamine and turkey red oil.

OTHER LIVESTOCK PESTS

Water suspensions containing DDT were found to be more desirable than solutions and emulsions in spraying dairy barns for the control of houseflies. The suspensions, when applied to animals, have also been found effective against horn flies. DDT and benzene hexachloride have shown more promise than any materials heretofore used for the control of all species of cattle lice. Both materials appear to be capable of eradicating cattle lice with one treatment, which has not been possible with the older remedies. Preliminary tests show that fleeces of animals dipped in DDT preparations for louse and tick control and sheared a few days later are rendered moth-proof. Fleeces sheared from animals dipped in solutions containing DDT were still as moth resistant in the spring of 1946 as when they were first tested after shearing in 1944.

CODLING MOTH

DDT has continued to give outstanding control of the codling moth wherever tested. A 50-per cent wettable powder containing DDT appears to be the most practical spray formulation for this purpose. Used with oil, DDT in excess of six ounces per 100 gallons in six applications during the season usually resulted in residues greater than the tolerance of 7 p.p.m. Evidence shows that outbreaks of red spiders and other mites result from the use of DDT because of its high toxicity to their predators. This group of problems is now receiving special attention. Because of the mite problem, and uncertainties about the status of residues, DDT has not been given unqualified recommendation for codling moth control despite its effectiveness. In small-scale laboratory tests at Beltsville, Md., benzene hexachloride showed promise for control of the insect, but in field tests at Vincennes, Ind., it was less effective than DDT.

ORIENTAL FRUIT MOTH

In tests in Ohio one application of DDT to peach trees 20 days before harvest effected a significant reduction in late-season injury by this insect, and the residues at harvest time were well under 7 p.p.m. Unfortunately, DDT is highly toxic to the important parasite of this moth, *Macrocentrus ancylivorus* Roh. Propagation of this parasite on the potato tuber worm continued to be highly successful although the breeding rate fell below expectations in the spring of 1946, owing to adverse weather conditions.

JAPANESE BEETLE

The program for distributing the milky disease of Japanese beetle grubs was continued in cooperation with state agencies in nine states and the Army Service Forces in the First, Second, and Third Service Commands. Spores of the milky disease organism, stored in dried-blood smears on glass slides, have now remained alive and effective for 10 years and the standard spore dust mixture has lost little or none of its infectiousness after storage for 6½ years. A cooperative nationwide precautionary Japanese beetle trapping program was inaugurated at 107 airports in 28 states outside the infested area to check on the possible accidental spread of adult beetles by plane. From one to three beetles were caught in traps at airports of six of the localities. Authority was granted on March 21, 1946 for the use of DDT for treating soil in nursery plots and potting soil as a means of obtaining certification for movement under Japanese beetle quarantine regulations of plants grown in such soil. Ethylene dibromide has been found generally to be much more effective than ethylene dichloride in various formulations as dips for eggs, larvae, and pupae of the Japanese beetle in soil masses and plant balls, and for surface applications to soil plots containing larvae and pupae. However, more information on plant tolerance is needed before this material can be generally recommended for quarantine treatments. Ethylene dibromide also showed promise as a fumigant for adult beetles.

WHITE-FRINGED BEETLE

By the end of 1945 this insect was known to occur on a total of 153,000 acres in Alabama, Florida, Louisiana, Mississippi, and North Carolina. During 1946, white-fringed beetle infestations were found in 41 Georgia counties, mainly across the central part of the state and at a small heel yard at Columbia, S. C. Most of these infestations were traced through shipments of nursery stock from Fort Valley and Macon, Ga. Nursery shipping record examination for the past decade revealed shipments to 26 states. Inspection of the planting sites of these shipments failed to reveal infestation in any additional states. Quarantine and control measures designed to prevent further spread from infested states included supervision of more than 260,000 shipments of nursery, farm, mill, and timber products, also soil, implements, and numerous other materials. Equipment has been devised to increase the efficiency and reduce costs of insecticide applications at critical points to keep down beetle populations and so also reduce the spread hazard. Treatment of soil with DDT has shown promise of becoming a practical means of controlling this insect. In preliminary tests, benzene hexachloride has been very effective against eggs, larvae, and adults of this pest.

EUROPEAN CORN BORER

This insect spread into relatively little new territory in 1945. However, populations were higher than during 1944 over the greater portion of the Corn Belt and losses due to the borer totaled about $37,000,000 in 1945. Experiments showed that this insect can be controlled with from two to four applications of DDT sprays or dusts, distributed with either ground or airplane equipment. It is possible that insecticidal control of the borer on canning and field corn may thus become practical.

GRASSHOPPERS

Weather during the early spring of 1946 was favorable to early hatching and rapid development. In May, however, unfavorable weather retarded hatching and development over the northern Great Plains. Infestations increased rapidly in June. Cooperative control operations were conducted in 23 central, midwestern, and western states, affording protection to 5,580,000 acres of crops worth more than $29,550,000. Specifications are now available for bait mixers of a size appropriate for counties or communities to build and maintain.

MORMON CRICKETS

Large numbers of crickets developed during the spring of 1946 in several areas in Idaho, Nevada, Oregon, and Washington. Approximately 1,120 tons of bait had been spread by the end of June on 151,000 acres of land by airplanes, by power spreaders, and by hand.

CHINCH BUGS

During the spring and early summer of 1945 cool weather, extremely heavy precipitation, and fungus disease reduced the potential chinch bug damage in most areas.

STORED-GRAIN INSECTS

In tests of new grain fumigants, ethylene dibromide in various combinations with carbon tetrachloride, ethylene dichloride, and carbon disulfide gave good protection from insect infestation to wheat stored in steel bins and wooden farm granaries. A mixture of acrylonitrile and carbon tetrachloride gave excellent results in wheat stored in wooden farm granaries, and mixtures of several nitriles in carbon tetrachloride gave excellent control of insects in wheat stored in steel bins.

DDT applied as a solution, an oil emulsion, or a water suspension was found to be the most effective material for treating interior walls of wooden farm granaries to reduce insect infestations. Experimental treatments of flour and grain sacks and food package wrappings in various ways with DDT and a related compound gave excellent protection of the contents and considerable promise that a safe and commercially practical way of applying such insecticides to food packaging materials may be found.

VEGETABLE INSECTS

In cooperative experiments with the Maine Agricultural Experiment Station, the addition of DDT to fungicide dusts and sprays applied to potato plots appeared to have no visible adverse effect upon the plants controlled infestations of the Colorado potato beetle and potato flea beetles, substantially reduced infestations of aphids, and appreciably increased yields of potatoes. In large-scale field tests, DDT applied as an aerosol gave satisfactory control of the pea aphid and resulted in substantial increases in yield of peas. The DDT aerosol also gave outstanding control of the onion thrips on cucumbers in commercial greenhouses, being more effective than any methods formerly employed. Encouraging preliminary results were obtained in tests with benzene hexachloride against the Mexican bean beetle.

PINK BOLLWORM AND OTHER COTTON INSECTS

In 1945, initial infestations of the pink bollworm were found in Brown and Medina counties, Tex., and reinfestations in Chambers, Harris, and Liberty counties after more than 20 years' freedom. A program was inaugurated in June 1946 to control this insect by applying DDT to the most heavily infested areas of the lower Rio Grande Valley of Texas and Mexico. Continued progress has been made in the cooperative work in Mexico and control practices in the two countries are constantly becoming more uniform.

The boll weevil caused more damage to cotton in 1945 than during any year since 1929, with the exceptions of 1932 and 1941. Serious losses were also caused by the bollworm, cotton flea hopper, and other cotton pests. Extensive tests were carried on in 1945 in cooperation with State Agricultural Experiment Stations and other agencies to obtain further information on the effectiveness of DDT against various cotton insects. These showed that a 10-per cent DDT dust was more effective against hemipterous insects of cotton than any other insecticide tested; that dusts containing from 2.5 to 10 per cent DDT were more effective against the tarnished plant bug than calcium arsenate or sulfur; and that DDT was not nearly so effective as calcium arsenate against the boll weevil. In preliminary tests high concentrations of benzene hexachloride killed the boll weevil more quickly than did calcium arsenate, and it also killed more cotton leafworms, plant bugs, cotton flea hoppers, and cotton aphids, than the standard insecticides. It is the first insecticide ever found that gives promise of destroying the boll weevil, cotton aphid, and other sucking insect pests of cotton at the same time.

GYPSY MOTH

Aerial application of DDT proved to be extremely effective against this insect, and in 1946 more than 60,000 acres of infested woodland were sprayed as part of the control program. The DDT was applied by aircraft, a new type of blower apparatus, and knapsack sprayers on more than 125 square miles of territory in Pennsylvania, eastern New York, and western New England. Preliminary results indicate complete control in areas treated by blowers and aircraft, and from drastic reduction to complete control where knapsack sprayers were used. A major revision of the area regulated because of gypsy moth became effective on Oct. 10, 1945, adding 9,100 square miles to the area.

FOREST INSECTS

The destructive outbreak of the Engelmann spruce beetle in Colorado continued, more than 1,000,000,000 board feet of Engelmann spruce being killed in 1945. Results of large-scale tests conducted in 1945 to determine what effect the widespread use of DDT over forested areas would have on beneficial insects, fish, and wildlife show that where only one pound of DDT per acre was applied, there was no apparent effect on the bird population, generally only slight injury to fish and other aquatic life, and only a temporary reduction in the general insect populations. In the spring of 1946 several large test plots were sprayed with DDT from an airplane for control of the white pine weevil, in cooperation with the New York State Department of Conservation. Preliminary observations indicate that reasonable control was obtained. The spruce budworm infestations covering several hundred thousand acres in Colorado suddenly decreased during 1945. A study of the entomophagous parasites showed a very high population of a number of species, but conclusions regarding the total contribution of parasites to the decline can not be drawn until other control factors are studied.

BEE CULTURE

An antibiotic associated with spores of *Bacillus larvae,* the causative organism of American foulbrood, has been found effective in laboratory cultures against various organisms, including those causing undulant fever, and human and bovine tuberculosis. The first preparations of this antibiotic, however, were exceedingly toxic to test animals. Methods for lowering this toxicity have been developed but, as yet, not to the point where the antibiotic may be safely administered to animals other than mice. A milk test for American foulbrood, based on the production by *B. larvae* of an enzyme that hydrolyzes milk, has been simplified so that it can be used in the field. This test should result in better control of this disease, since it enables apiary inspectors to make definite, on-the-spot determination. Extensive observations have indicated that DDT, when properly applied for insect control, appears not to have lasting effect on honeybee colonies in or near fields treated with this insecticide. Benzene hexachloride proved exceedingly toxic to bees under laboratory conditions.

FOREIGN PARASITE INTRODUCTION

Importations of parasites of the vegetable weevil, the cotton boll weevil, armyworm, and the sugarcane borer were continued. An extensive survey of the principal lime-growing district of the state of Colima, Mexico, disclosed that the parasite *Eretmocerus serius* Silv., which was introduced in 1943, has not effected control of the citrus blackfly. The importation from Australia of insect enemies of the Klamath weed was continued, and feeding tests were made on a series of crop plants.

Completed tests showed no feeding or reproduction by the imported leaf-feeders *Chrysolina hyperici* Foerst. and *C. gemellata* Rossi. The first releases of *C. hyperici* were made in northern California early in 1945, and releases of both species, totaling 19,000 adults, were made late in the summer of that year and in the spring of 1946.

DUTCH ELM DISEASE

There was some extension of the known limits of infection. Spread into Vermont and Kentucky constituted first records for these states. The finding of this disease in Ohio and West Virginia territory already invaded by phloem necrosis has further complicated enforcement of the quarantine. In small-scale tests, bark beetles that transmit the Dutch elm disease fungus and sucking insects that may transmit the virus causing the phloem necrosis disease of elm were controlled by the use of DDT Several large experimental plots were sprayed with power machines, using various formulas and dosages. Tests are under way to determine how many applications per season will be necessary for practical protection.

WHITE PINE BLISTER RUST

There was some extension of this disease in northern California and in the north central region during 1945. Nearly 19,000,000 ribes bushes were removed from 1,018,882 acres, of which 420,628 acres were initial eradication and 598,254 acres were rework.

BLACK STEM RUST

Stem rust on wheat caused very little damage in 1945 but was somewhat more prevalent on oats. Field operations resulted in the eradication of barberries on areas totaling 7,815 square miles, 10,066,871 bushes having been destroyed on 785 new and 1,647 reinfested properties. Ammonium sulfamate and 2,4-D were tested as herbicides. Preliminary readings show ammonium sulfamate to be extremely toxic but 2,4-D does not appear to be so promising.

FOREIGN PLANT QUARANTINES

The discontinuance of wartime restrictions on shipping and the resumption of world commerce materially affected foreign plant quarantine enforcement at maritime ports. Improved procedures for obtaining advance information on expected arrivals have been adopted, thus making possible a more effective utilization of personnel. Work loads were augmented by the arrival of increasing numbers of civilians by boat, as well as by the return of large numbers of troops from theaters of war. Inspection of 47,299 ships during the fiscal year ended June 30, 1946 represents an increase of 33 per cent over the previous 12-month period. Inspection of 58,631 airplanes at 45 ports of entry represents an increase of 28 per cent. Prohibited plant material was taken from 12,156 airplanes, representing an increase of 66 per cent over the previous fiscal year, while the number of arrivals increased only 28 per cent.

A total of 3,368 interceptions of insects and plant diseases were made from airplanes. Many of these pests, including mosquitoes, were stowaways that might menace public health, and plant pests of economic importance were found in plant material. These included a whitefly, the olive fruitfly, pink bollworm, the Mediterranean fruitfly, and others. This emphasizes the growing importance of the airplane as a rapid disseminator of pests between countries and even continents. More than 9,000 freight cars were fumigated as a condition of entry from Mexico. A total of 5,789,244 other vehicles and 1,282,566 pieces of baggage was examined upon arrival from Mexico, in cooperation with United States Customs. These figures represent increases of 22 and 38 per cent, respectively, over inspections made during the previous fiscal year. Greatly expanded air traffic and a revival in shipment of fruits and vegetables from Puerto Rico to the mainland also had a marked effect on plant quarantine activities.

FISHERIES

By Albert M. Day
Director, Fish and Wildlife Service, Department of the Interior

VOLUME OF PRODUCTION

In the first full year of post-war operation, the fisheries of the United States achieved a volume of production only slightly less than the average maintained before the war. The total yield of all fisheries in 1946 was some 4,200,000,000 pounds; during the five years from 1937 to 1941, production averaged about 4,400,000,000 pounds.

Although the 1946 production was not far below average in volume, the year was marked by extremes of success or failure almost without parallel in the history of the fisheries. Rosefish and tuna, for example, exceeded all previous production records; the salmon pack was the smallest since 1927; the menhaden catch was the largest on record; the pilchard fishery experienced the worst season in its history.

The Pacific pilchard or sardine had supported the nation's largest fishery for the past 12 years, but in 1946 the little known menhaden replaced it as the major item in the United States fish catch. In terms of pounds landed, the leading fisheries were menhaden, pilchard, salmon, tuna, Alaska herring, and rosefish, in the order named. These six accounted for more than half of the total production by all fisheries.

MENHADEN

The catch of menhaden was approximately 900,000,000 pounds, compared with 756,000,000 pounds in 1945 and 686,000,000 in 1944. The menhaden, which has supported a fishery since colonial times, now is the basis of a large industry for the manufacture of fish meal and oil. Centers of the menhaden industry in 1946 were Lewes, Del., Reedville, Va., Port Monmouth, N. J., Beaufort and Morehead City, N. C., and Fernandina, Fla.

PILCHARDS

After maintaining a production averaging close to 1,000,000,000 pounds in the past decade, the pilchard fishery landed only 491,000,000 pounds in 1946, or about one-half the quantity taken the previous year. The canned pack amounted to 3,050,100 cases. Pilchards were notably scarce in the waters of northern and central California, ordinarily the center of a busy fishery. Most of the pilchard boats that usually fish out of San Francisco and Monterey either turned to other types of fishing or moved to other ports, almost the entire 1946 catch of pilchards being made off southern California.

SALMON AND TUNA

Salmon was another Pacific Coast fishery that declined far below normal yields. The pack of 4,396,684 cases by canneries in the United States and Alaska was the smallest since 1927. In 1945, also a poor year, 4,900,471 cases of salmon were packed.

Tuna landings by the California fleet were so large that this industry set a new production record in 1946—4,760,000 standard cases as compared with a 1945 pack of 4,237,000 cases. The California tuna clippers again operated in distant waters below the Equator which had been closed to fishing during the war. In contrast to the success of the southern tuna fishery, the runs of albacore off the coasts of Oregon and Washington were so sparse that this fishery was almost a complete failure.

ALASKA HERRING

Alaska herring, which along with menhaden and pilchard supplies the raw materials for the fish meal and fish oil industries, continued the increase in productivity begun several years ago. From 113,000,000 pounds in 1944 and 120,000,000 in 1945, the catch of herring in the territory rose to approximately 190,000,000 pounds in 1946. Practically the entire catch of this fishery was converted into oil and meal.

THE NEW ENGLAND FISHERIES

Although the New England fisheries as a whole were slightly less productive in 1946 than in 1945, the major species in the catch—rosefish—made a gain of 38 per cent compared with the previous year. Although rosefish was a little used and almost unknown species only a little more than a decade ago, landings in 1946 totaled 180,000,000 pounds, or about a quarter of the total New England fish catch. Landings of all species at the principal New England ports amounted to 640,000,000 pounds, compared with 670,000,000 in 1945.

As in 1945, Gloucester received a larger poundage than any other Atlantic Coast port. Vessels fishing the North Atlantic banks landed at Gloucester 218,000,000 pounds, of which about 60 per cent was rosefish. Although Boston's landings—159,000,000 pounds—were smaller than Gloucester's, their total value was greater: $13,200,000 compared with $11,200,000. This difference was owing to the fact that haddock and cod, the chief items in the landings at Boston, bring a higher price than the leading Gloucester species, rosefish.

PACIFIC COAST FISHERIES

On the Pacific Coast, landings of salmon, halibut, flounders, and miscellaneous species at Seattle totaled about 55,000,000 pounds in 1946, a decline of some 5,000,000 pounds from the 1945 figure.

The pack of canned mackerel in 1946 was 910,200 standard cases. The Pacific halibut quota for 1946, established by the International Fisheries Commission in accordance with a treaty with Canada, was 52,500,000 pounds, the same as in 1945. The season was closed on August 19, 1946, after United States vessels had taken 39,300,000 pounds and Canadian vessels 17,900,000 pounds.

San Pedro was not only the most active port on the Pacific Coast but ranked first among all ports in the United States with landings of approximately 575,000,000 pounds having an estimated value of $17,000,000. This port received most of the pilchards and mackerel landed on the Pacific Coast and nearly half of the tuna.

Because of the failure of the 1946 pilchard fishery in northern and central California, the ports of Monterey and San Francisco, which normally handle enormous tonnages, declined to less important positions among United States fishing ports than they had held for several years.

FISH MEAL AND OIL

Production of fish meal in 1946 totaled 174,703 tons, compared with 185,399 tons in 1945. Fish oil likewise declined from 23,697,564 gallons in 1945 to 18,905,506 gallons in 1946. These reduced yields were the direct result of the failure of the pilchard fishery, normally the largest supplier of raw material for the fish oil and fish meal industries. The effects of the disastrously poor pilchard season were offset to some extent by the enormous catches of menhaden, which comprised somewhat more than half the production of both meal and oil. Both of these products are used extensively in animal feeding as sources of proteins and vitamins; fish oil also has a variety of industrial uses.

FUR SEALS

The fur-seal herd of Alaska's Pribilof Islands, a resource managed by the Fish and Wildlife Service, numbered 3,386,008 animals when the annual census was taken in August. This represents an increase of 7.31 per cent over the 1945 census. When the Government assumed management of the fur-seals in 1910, the herd contained only about 132,000 animals.

Government-administered sealing operations on the Islands during the 1946 season resulted in a take of 64,523 skins. Because of the late arrival of the seal herd at the Islands, probably occasioned by the unusually severe winter the previous year, the 1946 take was smaller than the 1945 by 12,441 skins.

At the public auctions held in St. Louis during the year, 54,064 fur-seal skins and 971 fox skins were sold for the account of the Government for a total of $3,861,410.

FISHING FLEETS

Although the number of fishing vessels, especially those of large size and wide cruising radius, had been greatly reduced during the war period by the requisitioning of such vessels for military use, the fleets on both coasts were restored in 1946 to a productive capacity greater than before the war. More than 1,000 fishing vessels were documented during the year, compared with 739 in 1945. Of the boats documented in 1946, about 85 per cent had been newly constructed in that or the preceding year. In an average year, only about 275 boats are added to the fleets to replace those lost by obsolescence or disaster.

INLAND FISHERIES

On the whole, the inland game fisheries of the United States were not adversely effected by the war. To a great extent the moderate drain on fresh water fisheries was linked with the rationing of gasoline and tires, which prevented anglers from traveling any great distance to fish. Waters near metropolitan areas were heavily fished, and in some sections the stock of fish was reduced to a certain extent. In other waters where the fishing pressure was less the stock was rebuilt somewhat.

Federal fish hatcheries, 108 in number, produced a total of 5,454,557,885 eggs, fry, and larger fishes during the calendar year 1945, the most recent for which a complete tabulation is available.

The stocking of multiple-purpose farm ponds with fish from Federal hatcheries reached a new peak during the calendar year 1945. During this period 7,600,000 fish were supplied to stock farm ponds, an increase over 1944 of more than 90 per cent. Farm ponds created under the auspices of the Soil Conservation Service received 4,900,000 fish. Many of the remaining fish were planted in ponds sponsored by the Agricultural Extension Service and the Agricultural Adjustment Agency. In connection with the stocking of farm ponds, the Fish and Wildlife Service made 13,276 individual plantings during the year. These represented only a portion of the total ponds stocked since many areas were planted with fish from state hatcheries. Most of the fish planted in farm ponds were warm-water species, with large-mouth black bass and bluegill sunfish the most popular forms.

During recent years the economic value of farm ponds has been thoroughly proved. It has been found that these small ponds, usually one to five acres in area, will produce 200 to 300 pounds of edible fish per acre annually, especially in the South, if they are properly fertilized and fished.

CONSERVATION OF FISHERY RESOURCES

One of the most important and far-reaching events of the year in conservation was the amended Coordination Act of 1946, known as the Act of Aug. 14, 1946, Public Law 732. It provides that Federal and state wildlife agencies acting through the Fish and Wildlife Service shall be given opportunity to participate in planning when any major construction development affecting fish and wildlife in rivers, streams, or other waterways is undertaken by the Federal Government.

On April 2, 1946, the United States and Canada signed a treaty to provide for the development, protection, and conservation of the fishery resources of the Great Lakes.

During November an international conference on the whale fisheries of the world was held in Washington to provide more effective means of conserving this resource.

FORESTRY

By Charles E. Randall
U. S. Forest Service, Department of Agriculture

GENERAL

The supply of timber products, which was short of demand throughout the war period, continued inadequate in the first full post-war year 1946. Pulp and paper were short. Lumber and plywood shortages greatly retarded progress in the Government's program to expedite housing construction. Distribution controls on lumber, which had been removed soon after the war ended, were restored early in 1946 to give priorities assistance to residential construction.

SAWTIMBER

A reappraisal of the forest situation in the United States, completed by the U. S. Forest Service in 1946, clearly indicated that the current shortage of timber products was not a temporary one. Under prevailing forest management practices, the trend in the forests was definitely toward scarcity.

A government estimate in 1909 placed the total volume of standing sawtimber in the United States at 2,826,000,000,000 board feet. The Forest Service reappraisal estimate, as of 1945, was 1,601,000,000,000 board feet, an indicated decrease of 44 per cent in 36 years. The actual decrease was probably even greater, since many kinds of trees which were formerly considered of no value are now being used and are included in the 1945 estimate, as well as trees of smaller size. Sawtimber, in the reappraisal estimate, means trees large enough to saw into lumber, whether or not so used.

The reappraisal showed a drop of 9 per cent in the nation's sawtimber stand as compared with estimates made by the Forest Service for the Joint Congressional Committee on Forestry in 1938. More than half of the present sawtimber stand is in what is left of the virgin forests, practically all of which are in the western states. Approximately a third of the remaining virgin timber, however, is of relatively low value species. In the states east of the Great Plains, which contain three-fourths of the country's total commercial forest land area, large areas have been taken over by inferior species or scrub growth, and there has been a general downward trend in tree sizes. Readily accessible, merchantable standing timber has become increasingly scarce in all regions.

The annual drain of sawtimber from the nation's forests was reported to be 53,900,000,000 board feet, while the amount of wood added to the timber stands each year by growth was only 35,300,000,000 board feet. Sawtimber drain thus exceeds growth by 18,600,000,000 board feet a year, or more than 50 per cent. The drain figure included losses from fire, wind-storms, insects, and diseases, but 90 per cent of it was from cutting timber for use. Much of the drain is of high quality material, whereas the growth is generally of poorer quality.

TIMBER-CUTTING SURVEY

The Forest Service reappraisal included a field survey of prevailing methods of timber cutting. It showed that prevailing cutting practice is still of the type that has resulted in progressive deterioration of large areas of forest. For the commercial forest lands of the United States as a whole, 23 per cent of all cutting was classed as good or better, 25 per cent as fair, and 52 per cent as poor or worse, from the standpoint of keeping the land continuously productive.

Cutting practices on public forest lands were notably superior to those on private lands. On the national forests, 80 per cent of all cutting was rated good or better. On private lands, only 8 per cent was good; 64 per cent was poor to destructive. Three-fourths of the nation's commercial forest acreage, including most of the land of highest potential timber-producing capacity, is in private ownership. The problem of assuring the country an adequate future supply of timber, therefore, is largely one of improving practice on private lands.

FOREST POLICY RESPECTING TIMBER SUPPLY

Heretofore, virgin timber and natural second-growth has provided almost the entire supply of wood in the United States. Man has taken only a very minor hand in growing the trees. In presenting the results of its reappraisal, the Forest Service pointed out that the United States was becoming increasingly dependent for its timber supplies on what it could grow. A forest growing stock must be built up and maintained large enough so that, as one year's crop is harvested, enough trees will be coming of age to provide the next year's crop. For a strong, expanding national economy, the Forest Service stated, sound forest policy should look to a growing stock that will yield an annual crop twice as great as present sawtimber growth.

"Whether we are in for a permanent timber shortage or whether we shall once again achieve timber abundance depends largely on what we do now," said Lyle F. Watts, Chief of the U. S. Forest Service, in his annual report for 1946. "A crop of wood cannot be grown in a single year like a crop of corn. Tomorrow's wood supply is in the trees growing in the forests today. We have the forest land. The challenge is to grow the timber."

PROPOSED FOREST PROGRAM

The program recommended by the Forest Service to build up the nation's growing stock of timber and keep its forest lands permanently productive included:

1. Increased public aids and services to help achieve good forestry practice on private lands. Among the proposed aids to private owners would be expanded research in forest management and wood utilization; technical advice and assistance on timber management, harvesting, and marketing problems; increased public cooperation in fire control; aid in protection against forest insects and diseases; aid in development of cooperative associations of small forest owners; and provision for long-term loans at reasonable rates to private forest operators to facilitate the conversion of their operations to a sustained-yield basis.

2. Public control of cutting and other practices sufficient to prevent destructive practices and require forest lands to be maintained in reasonably productive condition. The Forest Service proposed a Federal-state plan of regulation, under which the basic standards of practice would be set up by national legislation, but the actual regulatory work would be carried out by the individual states.

3. Expansion and development of public forests. Acquisition and management by Federal, state, and local governments, it was stated, is the only practicable way to assure stable ownership and satisfactory management for a large acreage obviously not suited to or destined for permanent private development. This would include substantial areas of depleted lands that are unlikely to be restored to productive condition by private owners, areas of such low productivity or inaccessibility as to be unattractive to private enterprise, and key areas for watershed protection or other public purposes.

4. An expanded public program of reforestation, forest rehabilitation, and timber stand improvement.

AMERICAN FOREST CONGRESS

The American Forestry Association, an organization of citizens devoted to the advancement of forest conservation, also completed a two-year appraisal of forest resources. Findings of this independent survey were in general agreement with those of the more comprehensive reappraisal made by the Federal Forest Service. To present these findings and provide an opportunity for public discussion of the problems involved, the Association called an American Forest Congress, which met in Washington, D. C. Oct. 9-11, 1946. Representatives of Federal and state forestry agencies, forest industries, labor unions, and various civic groups participated in the discussions.

All groups agreed on the need for positive nationwide action to stop the downward trend of the country's forest resources and bring about better management of forest lands, but opinions varied as to methods. The chief point of controversy was the question of regulation of timber cutting, although the consensus was that some degree of public regulation was necessary. Representatives of the forest industries generally favored regulation by the individual states without Federal participation. Other groups favored either direct Federal regulation or a cooperative Federal-state plan such as that proposed by the Forest Service. In the light of the discussions, the American Forestry Association planned to draft a comprehensive forest conservation program which it hoped would win unanimous support.

THE NATIONAL FORESTS

The total cut of timber from the national forests in the fiscal year ended June 30, 1946 was 2,700,000,000 board feet, a little under 10 per cent of the country's total output. The importance of the timber resources of the national forests continues to increase as timber supplies of the nation as a whole decline. Any further increase in output from the national forests, however, will depend largely upon construction of new roads to open up stands now inaccessible.

A program of access road building was started in 1946. The congressional appropriation of $7,000,000 for this purpose was supplemented by funds made available by the National Housing Agency. The road program will make additional timber available under Forest Service management policies which provide for utilization of mature or over-mature timber, improvement of forest growth, and continuous production. Eventually, the Forest Service believes the annual sustained yield of timber from the National Forests can be more than doubled.

WORLD FORESTRY ORGANIZATION

Organization of a Branch of Forestry and Forest Products in the United Nations Food and Agriculture Organization was accomplished in 1946. In 1944, a temporary forestry committee was set up under FAO which laid the groundwork for the permanent international forestry organization. Henry S. Graves, dean emeritus of the Yale School of Forestry, was chairman of the interim committee. A report issued by this committee in 1945 called attention to the fact that forest resources were declining on a worldwide scale.

Appointment of Marcel LeLoup of France as Director of the new international Branch of Forestry and Forest Products was announced in June, 1946. LeLoup is a forester and administrator of wide experience. Born in Brittany in 1897, a veteran of the First World War and graduate of the forestry school at Nancy, France, he served in the French Colonial Forest Service in Africa and in varied forest work in France. He was named Director General of the French Department of Forests and Waters in 1944.

Stuart Bevier Show, an American forester, was named deputy director and chief silviculturist of the international forestry branch. Show for the past 20 years was regional forester for the U. S. Forest Service, in charge of the national forests of California.

The world forestry organization established headquarters in Washington, D. C., and prepared to set up worldwide forestry statistical services, assist governments with advice on forest policy, send out missions to make scientific studies, promote research and circulate findings among nations, and facilitate exchange of scientific personnel.

AWARD OF THE SCHLICH MEDAL

The Society of American Foresters, professional organization of foresters in the United States, held its annual meeting in Salt Lake City in September, 1946. At this meeting, the Schlich memorial medal, highest international honor in forestry, was awarded to William B. Greeley, chairman of trustees of the American Forest Products Industries, Inc. Greeley was Chief of the U. S. Forest Service from 1920 to 1928. As executive secretary of the West Coast Lumberman's Association during the following 18 years, he made outstanding contributions to the advancement of industrial forestry.

The Schlich medal is named in honor of the late Sir William Schlich. British forester, who was inspector general of forestry in India, professor of forestry at Oxford, and author of technical works used by foresters throughout the world. The memorial medal was established in his honor by British and American foresters following his death in 1925. In the United States, the award is administered by the Society of American Foresters. Three previous awards have been made to Americans: Franklin D. Roosevelt (1935), Gifford Pinchot (1940), and Henry S. Graves (1944).

GIFFORD PINCHOT

Foresters and conservationists throughout the United States mourned the death of Gifford Pinchot (Oct. 4, 1946). Pinchot gave the first great impetus to the conservation movement in America. He was the first Chief of the U. S. Forest Service (1905-1910), founder of the Society of American Foresters, and a leader in the development of the profession of forestry and of technical forestry education in the United States. He was active in many fields and served two terms as Governor of Pennsylvania, but his outstanding contribution was his lifelong crusade for the conservation of national resources. His efforts were responsible, directly or indirectly, for much of the progress of the last half century in the advancement of scientific forestry practice in the United States.

DIVISION XII

MINERAL INDUSTRIES

GOLD, SILVER, AND PLATINUM

By Walter Renton Ingalls
Consulting Engineer, New York

GENERAL

Gold and silver are commonly described as the precious metals, included with them should be platinum, palladium, and the others of the platinum group. More accurately these should be described as the noble metals, for the advent of such new and useful metals as indium, germanium, etc., which in market value may be superior to silver, must now be considered.

GOLD

There is little to be added to the report on this subject for 1945. World's production, climaxing at 40,925,000 oz. in 1940, has been steadily diminishing since then, and having fallen to about 27,000,000 oz. in 1944, the American Bureau of Metal Statistics reckoned only 26,500,000 oz. for 1945. In 1946 the decline continued, for production in the great source of gold, *i.e.*, the Witwatersrand, which has continued to afford 12,000,000 oz. out of the annual total has been slightly unsteady, and elsewhere the contraction in copper and lead production has naturally been adverse to gold production. These remarks are based on the assumption that the gold production of Russia and Siberia has been about 4,000,000 oz. per annum; and that in Japan, Korea, and Manchuria it has been about 1,300,000 per annum; in respect of which parts of the world there is no information outside of them. In Moscow gold production has been a top-secret ever since about 1936. Consequently our current estimates of world's gold production are subject to correction when, as, and if the secrets be revealed.

The worldwide unrest of labor, the granting of demands for higher wages, and the increase in price level in general made conditions uncomfortable for producers of gold in South Africa and almost everywhere else, with the omen that there will be this economic restraint upon gold production. In Canada labor was enticed away from the gold mines by the higher wages offered in lumbering and otherwise.

ORANGE FREE STATE

Since 1936, prospecting by geophysical methods and by deep boreholes has been going on in an area around St. Helena in the Orange Free State, and during 1946 the indications became accepted that a goldfield of considerable size will be developed there. This is becoming known as the Odendaalrust field. The St. Helena discovery did not result from tracing the Witwatersrand beds and occurs in a different geological formation. In this sense it may be regarded as the only entirely new discovery in this region since the Rand bankets were first found in 1886. From St. Helena to the nearest point where payable values are known to exist in the Witwatersrand is 70 miles. During 1946 there was excitement from some boreholes giving rich samples.

GERMAN LOOTINGS

Not much has become known in respect of German lootings of gold, stocks, etc. beyond what was reported in this review a year ago. It was reported (May 27, 1946) that Switzerland had agreed to surrender to the Allies its hoard of Nazi looted gold, $58,140,000, or some 1 2/3 million ounces, looted chiefly from Belgium and France. There is no reason to revise the opinion of last year to the effect that the Germans in May, 1945, did not have much gold in their possession or to their credit.

It was reported in the newspapers, Aug. 28, that all the gold in Japan (about $200,000,000, equal to about 5,700,000 oz.) is to be claimed by the United States to defray the cost of occupation.

GOLD PRICE

Apart from the Witwatersrand (Transvaal) and Russia, the world's greatest gold-producing country from mines worked principally for gold is Canada, which possesses the important districts of the Yukon and Ontario-Quebec. On July 5, 1946, the Canadian Foreign Exchange Control Board raised the Canadian dollar to par with the American dollar for the first time since October, 1939, thus erasing the discount of 10 per cent. The Canadian price for gold was thus dropped from $38.50 per ounce to $35, extinguishing the prior advantage of gold mines. Late in 1946 the Canadian dollar fell to about 95 cents although the official rate of exchange continued at par. As in 1945 the London rate remained at £1 = $4.025.

MONETARY STOCK OF GOLD

According to the *Federal Reserve Bulletin,* the world's stock of gold at the end of 1928 was 486,454,000 oz., of which 181,180,000 were in the United States. At the end of September, 1944, it was 1,006,000,000 oz., of which 595,000,000 were in the United States. The increment from 1928 to 1944 includes 41,569,000 oz. from liquidation of hoards, chiefly in India. At the end of 1945 gold reserves were still difficult of computation owing to silences during the war, etc. The American reserve was about 589,000,000 oz. at the end of 1944 and 573,000,000 oz. at the end of 1945.

SILVER

The world's production of silver has been declining ever since 1940 in which year it was computed as 273,400,000 oz. The decline in production since then has been ascribable in part to the decline in the production of copper and lead from which a large part of the silver is obtained as a by-product, and in part to military interruption, including the loss of such a large production as that of Burma (about 7,000,000 oz. per annum). The American Bureau of Metal Statistics, reporting in May, 1946, was of the opinion that the world's production of silver in 1945, outside of the unknown Asiatic, was probably no more than 150,000,000 oz. The conditions diminishing silver production in the United States in 1946 were even more pronounced than in 1945.

Production of silver in the United States was only 6,000,000 oz. in the first half of 1946, having been curtailed by the less production of copper and lead ores from which most of our domestic silver is derived. The total for 1946 will be substantially less than the total for 1945 (29,332,000 oz.). Production in Mexico in the first half of 1946 was 20,000,000 oz., curtailed by strikes, and its total for 1946 will be less than the 60,000,000 oz. of 1945. In Australia, Canada, and Peru, production in 1946 was running at about the same rate as in 1945. The five countries hereinbefore mentioned accounted for about five-sixths of the world's silver in 1945 outside of the unknown Asiatic.

COMMERCIAL CONDITIONS

On the other hand the industrial use of silver has been increasing sharply, and in the United States it has attained a steady level of about 125,000,000 oz. per annum. As compared with five years ago, there has been an increase under most heads, but especially in sterlingware, nitrate (for photography), jewelry, and such new uses as brazing alloys and electrical contacts, each of which has been absorbing about 15,000,000 oz. per annum.

With this clear condition of unbalance between demand and supply it was natural that the market for silver became uneasy. Adjustments in the United States had been made in 1945 by OPA lifting the price to 71.11c. per ounce for both foreign and domestic silver. The Canadian Government, however, continued to hold its old ceiling price of 40c. per ounce, but on Feb. 1, 1946 it was rescinded. In the meantime the Green Act liberating Treasury silver for use in the arts expired with the end of 1945, and manufacturers were embarrassed by the absence of supply, legislation to ameliorate the situation having been proposed in Congress but becoming involved in the wrangle that always occurs when the price for silver is the subject.

As early as June, sales of foreign silver refined in the United States were reported as being made at 82-88c. for export for coinage abroad. With the expiration of OPA (June 30) Mexican silver began to move into American industry on the basis of 90-92c. per ounce. On July 12 Handy & Harman posted the official price at 90⅛c. This was withdrawn on July 26 upon the reestablishment of OPA, which restored the former ceiling price of 71.11c. Sellers being unwilling to offer silver at that price the result was cessation of transactions in the New York market. On July 31, Congress enacted a silver purchase and sales act, authorizing the Treasury to buy silver newly mined in the United States at 90.5c. per ounce, if mined subsequent to July 1, 1946 and offered within a year. The Treasury was further authorized to sell to industry unobligated silver at 91c., the differential of ½c. being to cover handling charges. On Aug. 6, silver advanced to 55½ pence London, equivalent to 93¼c. New York, the difference between the London price and the U. S. official being to cover shipping charges, etc. Silver in the United Kingdom continued to be controlled by the Treasury. During the last quarter of 1946 the New York official price was 90⅛c. until about the end of December when it fell to 83¾c.

GREAT BRITAIN, INDIA, AND MEXICO

The events in silver naturally had important repercussions in Mexico and India. On May 23, the Government of India announced the introduction of half and quarter rupee coins of pure nickel as a substitute for nickel-silver alloy, the purpose being to save silver and make it easier to return within five years of the end of the war the 226,000,000 oz. of silver borrowed from the United States between 1943 and 1945. Previous reduction of the silver content of the rupee had failed to offset the upward trend in the price for silver.

During September, it was reported that the British Government had decided to take silver out of its currency, substituting nickel, this being expected to release 250,000,000 oz. of silver needed to replace silver borrowed under lend-lease.

SILVER STOCK IN THE UNITED STATES

The stock of silver held by the U. S. Treasury at the end of 1945 was 2,005,120M ounces (68,746.2 tons of 2,000 lb. avoirdupois) compared with 80,406.2 tons at the end of 1944 and 92,111.6 tons at the end of 1943. Under the terms of the Green Act, effective July 12, 1943 and ending with 1945, sales to domestic industry aggregated 140,634,415 oz., and 26,745,826 oz. were sold to the Philippine Government for coinage. The Treasury stock of silver includes that which had been loaned for use in defense plants.

During October, 1946, arrangements were made for return to the U. S. Treasury of the silver thus loaned for use as busbars and otherwise in industrial plants. At the end of 1945 this loan aggregated 30,092.7 tons avoirdupois. Much of the silver was used in the aluminum and magnesium plants and a good deal in the atomic bomb plants. This silver will have to be recast into either Mint bars or commercial bars.

PLATINUM

Among the precious metals are those of the platinum group, especially platinum and palladium. World's production of platinum, so far as known, is about 300,000 oz. per annum, derived chiefly from Canada (162,000 oz. in 1945), Colombia (40,000), Transvaal, South Africa (58,000) and United States (40,000). There is also an unknown production in the Urals, which formerly was the world's chief source but which in recent years has been a secret of the USSR. Conjecturally it is of the order of 100,000 oz. per annum.

The production in Canada is entirely as a by-product from the nickel-copper ore refined by the International Nickel Co. The production of palladium is also a by-product of the International Nickel Co. and in 1945 amounted to about 140,000 oz.

Platinum is used especially in the chemical industry, in electrical manufacture, and in jewelry. Palladium is used in similar ways, but most largely for jewelry, it being a constituent of the alloy known as white gold.

During 1945 the price for platinum was $35 an ounce, and for palladium $24. Early in 1946 these metals were liberated from OPA control, whereupon the price for platinum quickly rose to $53 an ounce. Near the end of June it rose further to $67, advanced to $80 in August, and to $90 in September. Early in October it receded to $85 and then dropped rather quickly to $69, but recovered to $70 and then relapsed to $53. Throughout 1946 the London market kept step with New York. In the meantime the price for palladium remained at $24. The advance in the price for platinum is explained as reflecting increased demand for it in jewelry, but about the middle of 1946 there was certainly a speculative interest in it for the purpose of hoarding. Gold being unobtainable for that purpose, thoughts turned to platinum as another precious metal, highly useful and always of value, though unsteady.

IRON AND STEEL

By THOMAS C. CAMPBELL
NEWS-MARKETS EDITOR, *The Iron Age*

GENERAL

Whether or not they realize the full significance of it, steel labor and steel management have entered a period when the law of diminishing returns is definitely operating against both. The wage increase which the steel union will wring from steel firms in 1947 and the prices which must be raised partially to offset the resultant increase in steelmaking costs may set in motion a chain of events which will eventually cost both groups far more than they are expecting in lost wages and lost production.

Because users of steel have never been able to get enough material to set up a production schedule that would anywhere near satisfy demands made upon them, there has been a disposition to pay any price, submit to any conditions, or to take something other than what was wanted in order to keep plants in operation and skilled workmen on the payroll. This will not always be the case. The cost of steel is a universal gauge in pricing items into which steel goes. It has always been this way, and most firms utilizing steel use a formula to establish their prices the base of which is the net price paid for steel.

STEEL WAGES AND PRICE FACTORS

Steel wages have almost the same relationship to other wages as steel prices do to items made from steel.

This was well demonstrated when early in 1946 the increase in steel wages and in steel prices caused a breakthrough in the "hold the line" policy. This action formed a pattern for other industries, and the gains made by steel labor were shortlived. No single group can obtain wage advantages for long when other groups are well organized and can demand similar concessions. The same general condition applied to steel management. When the price of steel was increased, this set off a wave of prices in other fields with the result that the cost of making steel went up again because of higher material and equipment prices.

Steel industry and labor now seem ready to repeat the whole process which brought such little return to labor and management in 1946. The two groups stand a good chance of making a start at real collective bargaining, but the cards seemed stacked against both. Labor is afraid of rising prices. Management, seeing for the first time a chance to make bigger profits, is absorbed in figuring out how to do this and still meet labor's demands.

If conditions in 1947 follow the pattern of 1946, the long awaited and long debated period of four to five lush years may never come, or before it does show its tardy head, both labor and business will suffer at the hands of those who make or break prosperity for both—the public. Already many would-be consumers have given up buying that "treasured dream," either because they have found they can now get along without it or because when they pay their bills they have little or nothing left over.

Another year with from 14,000,000 to 16,000,000 tons of steel lost because of steel and coal strikes would so upset the system of distribution in the United States that a complete breakdown in the economy of the country might result. Most steel leaders know this, and so do intelligent labor leaders. Both, however, are so driven by the immediate demands of their respective groups that it is hardly likely that either will be able to do anything in 1947 except the obvious—the union holding out for higher wages with the threat of strikes and business heads raising prices to make up for wage increases which they will give only to keep the wheels of production going.

STRIKES AND PRODUCTION

Any attempt to indicate that labor relations are not again the major theme in 1947 is akin to burying one's head in the sand. The disastrous results of three major strikes—steel, coal and electrical equipment—in 1946 are still apparent. Not only has the country failed to keep up with demand on the homefront but a large segment of the population has suffered so long from strike-fear neurosis that a part of it is immuned to expressing shock or indignation. This state has so affected workers that productivity is far from what it should be, and the day when a man or woman did a good day's work seems to have been replaced by the feeling that if one reports for work the obligation has been fulfilled.

All efforts of economists and management to portray the fact that real wages are the ones which pay the bills failed of their purpose in 1946. No attempt to show that higher wages followed by higher prices meant static condition or even a loss in real wages was successful. The suspicion of the average workman towards his company and towards economists in general is as strong as it ever was. The workmen feel that to get an increase in actual money is better than taking a chance that if they do not get it prices will not go up.

The numerous strikes which occurred with monotonous regularity in 1946 have, in one way, contributed to inflation by cutting down the production of goods. The settlement of these strikes, which has always resulted in healthy wage increases and higher prices, has laid the groundwork for the inflation which all seem to fear but do little about. It may be, however, that prices in 1947 will go too high to support a normal high business cycle with the result that a severe testing of all prices, especially steel, is in store before the year is out.

STEEL PRODUCTION

Steel production in 1946 amounted to about 65,900,000 tons of ingots compared with 79,400,000 tons in 1945. Barring strikes and other slowdowns, the industry in 1947 will probably turn out close to 80,000,000 tons of steel ingots. However, should the inventory situation and the overpricing in the general economy have the effects which some quarters look for, steel ingot production in 1947 may not range more than 70,000,000 to 75,000,000 tons of steel ingots.

Alloy steel production in 1946 amounted to approximately 6,025,000 tons compared with 8,648,000 tons in 1945. Carbon steel output in 1946 amounted to 59,875,000 ingot tons compared to 70,743,000 in 1945.

Of the total alloy steel production in 1946, 73 per cent was made by the openhearth process and 27 per cent was made in electric furnaces. In 1945 the relationship was 67.6 per cent by the openhearth and 32.4 per cent by electric furnaces.

Total pig iron production in 1946 is estimated at 45,450,000 tons, compared with 54,919,000 tons in 1945. Blast furnaces throughout 1946 were shut down a number of times because of strike conditions.

Finished steel production in 1946 amounted to 46,868,000 tons compared with 56,946,000 tons in 1945. The pattern of distribution of finished steel in 1946 was almost identical with the pre-war year of 1939. The automotive industry in 1946 obtained almost 13 per cent of total finished steel production, but a substantial part of this still remains in manufacturers' plants as unbalanced inventories. There seems every reason to believe that the distribution of finished steel in 1947 will follow the same percentage figures as in 1939 and 1946. A rough presentation of these percentage figures are as follows: Agriculture, 3.5 per cent; automotive, 14 per cent; construction and maintenance, 16 per cent; containers, 9 per cent; machinery and tools, 6 per cent; oil, gas and mining, 4 per cent; pressing, forming and stamping, 6.5 per cent; railroads, 9 per cent; exports, 7.5 per cent; miscellaneous, 24.5 per cent.

EXCESS DEMAND FOR STEEL

Three or four good months of steel operations at close to 90 per cent of capacity, with some increase in worker productivity either by better management or by greater worker output, would clean up the excess demand which has been hanging over the steel market since the war ended. By that time it would be seen whether the industry can operate at high rates continuously and whether the consumer demand which has been on paper for some time actually exists in fact or in the minds of the market experts. This much needed test can not be made, however, if the steel industry in particular must go through a wage-demand-strike-wage-increase-price-increase cycle every year. For that reason alone it must yet be proved that "prosperity is just around the corner."

NON-FERROUS METALS

By Walter Renton Ingalls
Consulting Engineer, New York

GENERAL

At the end of the war with Japan it was expected that use of the non-ferrous metals would be diverted quickly to pre-war channels of consumption in which there was great need to restore the natural flow, such channels being the building of houses, manufacture of motor vehicles, resumption of suspended construction of electric light and power plant, telephone plant, rehabilitation of railways, and resumption of manufacture of numerous electrical apparatus for industrial and household use. For economic reasons these resumptions did not begin as expected, strikes of labor being an obstruction among other things, and such flow of the metals as began was largely to fill the pipelines of industrial manufacture. The year 1946 began with such obstructions, which spread widely through major industries, while OPA, in some persons' opinion, offered for political reasons interferences with the law of supply and demand. Not until June was there a settlement with labor, which followed the granting of an increase of 18½c. per hour in wages and an allowance of compensating increases in prices by OPA.

EFFECT OF STRIKES ON PRODUCTION

Numerous events of 1946 were common to the major non-ferrous metals, either in their occurrence or in their effect. Strikes curtailed production in the United States and also in Mexico, Chile, and Rhodesia, and led to serious shortage of supplies of copper and lead. Settlement of the strikes in the United States, by granting increase in wages, raised the cost of production, which was further increased by the higher cost of coal and railway carriage used in production. The advance in freight rates July 1 added $1 per ton to the price of lead and zinc in New York as compared with St. Louis, and similarly the rates on copper, lead, and zinc from the Far West. Production of copper, lead and zinc in the United States continued under subsidy, which ceased with the expiration of OPA, June 30, but was restored with the revival of OPA, July 26.

GOVERNMENTAL INTERFERENCES

When OPA expired, June 30, its ceiling prices were 14⅜c. for copper, delivered in Connecticut; 8.25c. for lead, New York; and 8.25c. for spelter, St. Louis. On July 2-3 American producers raised their prices for lead to 9½c., and for spelter to 9½c., these being in harmony with free prices ex U. S. A. On July 26 OPA, having been revived, "rolled back" the prices to those of June 30, and kept them there while prices ex U. S. A. continued to rise.

By presidential order, Nov. 10, controls of all prices, except in respect of rents, rice, and sugar, were abolished forthwith. On Nov. 11 the price for lead was raised to 10½c. New York (10.35c. East St. Louis) and the price for zinc to 10½c. East St. Louis. On Nov. 13 the price for copper was raised to 17½c., delivered Connecticut.

These advances brought domestic prices in harmony with world prices, each of these metals still coming into U. S. A., duty free, when imported by the Government, which in respect of copper and lead could legally be done up to March 31, 1947. Nov. 18-19 all restrictions on imports of lead and copper were removed, and the Government terminated its purchasing of foreign copper, effective immediately. This brought into effect the import duty of 1¹⁄₁₆c. per pound on lead and 4c. per pound on copper, which the Government had not been obliged to pay. While price controls were thus removed, various other controls remained, especially in respect of allocation of supplies by the Civilian Production Administration and otherwise.

ABSORPTION OF SURPLUS ACCUMULATIONS

Prior to the end of the war there were fears in respect of large quantities of military scrap overhanging the markets. During 1946, such fears were dispelled. Through diminished production by strikes and otherwise, it became necessary to draw heavily on governmental stocks. Up to the end of 1945, a grand total of about 305,000 tons of fired cartridge cases was returned into consumption in the United States. During 1946 this reflux practically ended. The British Government, in great need for copper, collected 165,000 tons of empty cartridge cases and contracted with American refiners (with a small Canadian participation) to beneficiate this material and return to Great Britain the refined copper obtained from it. Receipts of this material were to begin in November.

ALUMINUM

Before the end of 1945 most of the government-owned plants for the production of ingot aluminum had become idle, and many of them had already been dismantled. This industry thus passed into the hands of the Aluminum Company of America (Alcoa), Reynolds Metals Co., and Kaiser-Fraser Corporation, which acquired a government-built plant at Spokane, Wash. The plant at Jones Mill, Ark. was acquired by the Reynolds Metals Co., as was also the Hurricane Creek alumina plant, Alcoa having agreed to the use of its plant on a royalty basis. Some of the rolling mills were subsequently acquired by Alcoa. Efforts to liquidate the government-owned plant otherwise came to nothing, and the industry thus settled down on a commercial competitive basis among the three big companies.

According to George R. Gibbons, senior vice president of Alcoa, the economical capacity in the United States for the production of ingot aluminum is now about 600,000 tons per annum, which is about half of what was established during the war. Of the present economical capacity, Alcoa has about 235,000 tons, the remainder being divided between Reynolds and Kaiser, the latter holding only a minor part.

Of the fabricating plants operating for the Government by Alcoa during the war, several have been sold or leased to Reynolds and Kaiser. Alcoa has been able to obtain only the extrusion plant at Cressona, Pa., the Government having refused Alcoa bids for other plants.

The year 1945 began with a large stock of aluminum, MRC (Metals Reserve Corp.) alone having about 185,000 tons of primary ingot, a substantial part of which was in Canada, a portion of the RFC (Reconstruction Finance Corp.) purchase of 37,500 tons in 1945 having been allowed to remain there. However, no signs of weakness developed in the American market, and the producers entered courageously into campaigns for increasing the use of aluminum, especially in directions where the saving of weight would be attractive, *e.g.*, for the superstructures of railway cars, ships, motor vehicles, etc. A two-months strike at Alcoa, Tenn., surprisingly produced a shortage of immediate supply, and on May 20, 1946, MRC on recommendation of CPA allowed 35,000 tons of aluminum ingot to be withdrawn from stocks. On July 1 application for withdrawal of 25,000 tons additional was allowed. This reduced government holdings to about 125,000 tons of primary ingot as of June 30, 1946. By the end of September those holdings had been further reduced to about 92,000 tons.

Production in 1946 was about 420,000 tons, attaining about 50,000 tons per month, or capacity rate, toward the end of the year. Aluminum sheet was extensively introduced into housing construction, a rather new channel of consumption, at least on so large a scale. NHA (National Housing Agency) expects to require 200,000 tons of aluminum in its housing program for 1947.

The price for ingot aluminum, 99 per cent pure, was 15c. per pound during 1942-45, and this price continued unchanged during 1946. The price in Canada during 1945 was 15c. per pound f.o.b. Arvida, Quebec, which was equivalent to 16c. per pound delivered to domestic consumers. Aluminum Co. of Canada, May 1, 1946, reduced the price to 15c. delivered in Canada, bringing the Canadian price about in line with the American price after allowing for the discount of Canadian dollars and adding the import duty of 3c. per pound. The export price was reduced to 13¼c., Canadian, f.a.s. Atlantic ports, this being equal to the British price of £67, equal to 12.04c. American, which was made on April 10, 1946.

COPPER

Strikes began to close the copper mines in the United States in January 1946, and were not settled until nearly the end of June. In the meanwhile there were strikes in the smelteries, refineries, brass mills, and wire and cable mills. Settlement was eventually arranged by granting an increase of 18½c. per hour in wages, and OPA allowed an advance in the ceiling price for copper from 12c. to 14⅜c. but only to those who agreed to pay the wage increase. This limitation was abolished when OPA was revived.

The effect of the interruption by strikes was to reduce copper production of mines in the United States to 235,000 tons in the first semester of 1946 compared with an expectation of 500,000 at the beginning of the year.

In the meanwhile deliveries ex fabricating mills averaged about 90,000 tons per month, the deficit being supplied by drafts from OMR (Office of Metals Reserves) stocks and by importations from Chile. The total visible stock of copper in this country at the beginning of 1946 was 1,305,000 tons, not including substantial stocks at arsenals of the Army. Of the visible stock, OMR had 476,000 tons. The remainder was largely metal in process, which is substantially a constant for conduct of the industry. By the end of November, OMR stock had been reduced to 117,000 tons.

Deliveries ex mills, which will be about 1,250,000 tons in 1946, were largely to fill depleted channels leading to end-use, for the latter was curtailed by strikes in automobile manufacturing and in other copper consuming industries.

Copper production was curtailed substantially in Chile, where also there were labor troubles, but was well maintained in Africa although shortage of coal and of water power were retarding in both Katanga and Rhodesia. However, a crippling strike in Rhodesia in August and a new strike in Chile in September were further deprivations.

In the second quarter of 1946, MRC purchased a large tonnage of Chilean copper at 11⅞c. f.o.b. Chilean ports, equivalent to 12½c., New York, and of course this copper was duty free. For third quarter delivery 50,000 tons were bought at 15¾c. f.o.b. Chilean ports, and for fourth quarter delivery 35,000 tons at 15⅞c., equivalent to 16½c., New York, which was about in harmony with the world price. By the beginning of October, the world price, or the free price, for copper had become firmly established at 17¼c. f.a.s. New York. Upon termination of purchasing of foreign copper by the U. S. Government, American producers raised their price to 19½c., delivered in Connecticut, the price for foreign copper for export being then about 18c. The differential represented protection by the 4c. duty. At the end of December copper was firmly at 19¾c. f.a.s. New York.

LEAD

Production of lead in the United States in the first half of 1946 was handicapped by OPA price restrictions, by shortage of labor, and by a strike that closed all of the plants of the American Smelting and Refining Co. during the larger part of the semester. The production of refined lead was thus reduced from 51,000 tons in January to 18,500 in June. American lead consumption consequently had to be supplied by imports from Canada and Mexico and by drains from stocks of OMR; and also from invisible stocks in the yards and warehouses of consumers, *i.e.*, corroders, battery manufacturers, etc. In so doing, all stocks were dangerously reduced. The situation would have been much worse had it not been for the production of secondary smelters remaining steady at about 20,000 tons per month, their supply being chiefly battery scrap which is a run-around material, *i.e.*, about 300,000 tons of lead annually goes into storage batteries in this country and in less than two years 75 per cent of it, or more, returns normally as scrap for reproduction as refined lead.

At the beginning of 1946 stocks of refined lead at refineries and in warehouses for the account of MRC aggregated 103,400 tons. At the middle of 1946 these stocks had been reduced to 55,000 tons. At the end of September there were 61,000 tons.

Shortage of lead was also experienced outside the United States, especially in Great Britain, where the government prohibited exports in an order at about the middle of the year. Grave fears were expressed in respect of the outlook for this metal. However, it is to be observed that production in Mexico was curtailed by the strike in the early part of 1946 following which its production increased substantially. The production in Canada was maintained steadily at a little better than the rate of 1945. The Australian producers complained of labor troubles, governmental interference, shortage of labor, and the exigency of catching up with development work neglected during the war. Of course, that is a troublesome condition existing among all of the great lead producing countries, which are the United States, Canada, Mexico, and Australia. Also it is to be remarked that an annual production of 80,000 tons a year has been lost through the devastation of the Burma mine prior to the Japanese occupation. Moreover, the Trepca mines in Yugoslavia, with an annual pre-war production of 75,000 tons, have been nationalized and their present production, whatever it may be, has been diverted to Russia. Furthermore, the mines of Germany used to afford about 100,000 tons of lead a year, but some of them have now passed to Polish ownership and some are in the Russian occupation, and production of what remains plays no part in international economy either as to supply or demand. On the other hand, in the early part of 1946, lead production was resumed by Mt. Isa in Western Australia with expectation of quickly regaining its pre-war annual rate of 40,000 tons.

The ceiling price for lead established as 6.5c. New York and 6.35c. St. Louis in February 1942 remained unchanged during 1943-45. However, the shortage in lead supply began to become acute early in 1946 and on Jan. 16, the U. S. Commercial Co. (subsidiary of MRC) agreed to pay 7c. per pound for foreign refined lead delivered in U. S. A., the duty of 1$\frac{1}{16}$c. per pound to be absorbed by the Government, as also the added cost of ½c. per pound when this lead should be sold to domestic consumers at OPA ceiling price of 6.5c. The foreign market having thus started to move upward, OPA on May 29 raised the ceiling price for lead to 8.25c. New York. Thenceforward the world price, or free price, continued to advance and at the beginning of October the U. S. Government bought Mexican lead for fourth quarter delivery at 10¼c., Gulf ports.

Upon removal of restrictions on private imports of lead the price advanced to 11.8c. New York and 11.65c. St. Louis, and at the middle of December rose to 12.55 and 12.35 respectively.

TIN

At the beginning of 1946 there were 91,623 tons of tin in stock in the United States, including pig tin and the recoverable tin content of concentrate and government stock and private stocks. There were also 33,200 tons of tin in stock in the United Kingdom. A commission sent from Washington to survey the situation found that following V-J Day there was a total of about 41,000 tons in the Orient, distributed through Malaya, Siam, Banka, and Billiton, and including 10,000 tons of pig tin in Japan. The poor condition of the tin mines of the Orient was believed by John J. Croston, head of this commission, to limit production in 1947 to 80,000 tons, and it was thought that even in 1948-49 it might be under the rate of the pre-war basis. British authorities were more optimistic. The British companies operating the great smelteries at Singapore and Penang found that they had not been badly damaged, and Penang was returned into operation on Apr. 6, 1946.

American contracts with Bolivian producers having expired, negotiations continued during the first half of 1946, and it was finally agreed on Aug. 14 that RFC would settle for Bolivian ores on the basis of 62½c. per pound and that, if deliveries during the year should exceed 17,600 metric tons, a production bonus of 1c. plus a smelting bonus of 1½c. would be granted for the first half of the year retroactively to Jan. 1, and a bonus of 3c. plus 1½c. for the second half of 1946. This made the buying price come to 65c. for the first half of 1946 and 67c. for the second half, these being the prices for tin in ore, less charges for freight and smelting.

Production of tin by the Longhorn smeltery (Texas City) was 23,167 tons in the first half of 1946, and having subsequently continued at about the same rate the year's production will be about 46,000 tons against 40,591 tons in 1945. This production is derived largely from ore imported from Bolivia.

With some imports of pig tin, plus the production by smelting in this country, and with curtailed consumption for solder, foil, etc., and the saving effected by the introduction of electroplating, the situation of tin in the United States has not been troublesome. It is recognized, of course, that the situation is abnormal in that the smelting of tin ore in Texas is a subsidized production.

The foreign tin supply came under the control of what became known as the Combined Tin Committee (comprising representatives of the United States, United Kingdom, France, Belgium and Holland). Out of supplies becoming available in the Orient and elsewhere, this committee allocated 25,000 tons in the first half of 1946, of which 9,000 tons came to this country, and 18,000 in the second half, of which 6,400 tons came to the United States.

At the International Tin Conference in London, which ended Oct. 11, it was estimated that world's production of tin in 1946 would be 94,000 tons against consumption of 137,000. Production in 1947 is expected to be 142,000, but a rate of 200,000 will not be reached until sometime in 1949.

The price for tin of 99 to 99.75 per cent grade was held by the British Ministry of Supply at £300. On Sept. 26, this price was raised to £380½, equivalent to 68.37c. per pound. Tin of very high grade was allowed a premium of £4.

The price for tin in this country was kept at 52c. for high grade (99.8 per cent and higher) although in the course of 1946 this was exceeded in the free market, and in the fourth quarter was nearly 18c. per lb. below the established world value. When OPA price restrictions were abolished, Nov. 10, the price for tin in the United States became 70c. per lb.

ZINC

The production of zinc as spelter in this country attained a maximum of 942,000 tons, since when it has been waning, and at the beginning of 1946 the rate was about 63,000 tons per month. Besides the production as spelter, there is a large production—approximately 140,000 tons a year—in oxide, lithopone, etc. directly from ore which also has been waning, but not so much as the production of spelter. Production of the latter is derived extensively from imported ores. The supply of zinc for all purposes from domestic ore was 798,000 tons in 1941. In 1945, it was only 643,000 tons, and in 1946 the monthly rate dwindled further. In order to support production during the war, a large part of the domestic mining industry was subsidized, which continued during 1946.

The stock of slab zinc at metallurgical works, in transit to consumers and at the plants of consumers, was 351,000 tons at the beginning of 1946 and 366,000 tons at the middle of the year. Of the stock at the middle of 1946, about 222,000 tons belonged to OMR. Not until late in the year was any of this released for domestic consumption. At the end of October, the OMR stock was 182,000 tons.

At the beginning of 1946, MRC had about 350,000 tons of zinc in ore, estimated as recoverable, in stocks stored partly in the United States and partly abroad. During the first half of 1946 supplies, including some of this stock, were brought to this country on a large scale from Canada, Newfoundland, Mexico, Argentina, Bolivia, and Peru. There were also the stocks owned by American smelters, and also there were substantial stocks at originating mills in Argentina, Australia, Canada, Mexico, etc., but these were largely of the nature of normal reserves.

Of the production (715,800 tons) of spelter in the United States in 1944, there were 443,790 tons subsidized, making the cost of all U. S. spelter come to 11.04c. In the first half of 1945 the total cost was 11.12c. No later figures have been given officially, but the cost in 1946 was higher.

With the large stock of spelter on hand, and available in ore not yet smelted, the statistical position of zinc was apparently easy. However, there were unbalances among the several kinds of the metal which led to some discomfort.

XII. MINERAL INDUSTRIES

PETROLEUM

By Robert E. Allen
Director of Information, American Petroleum Institute

PETROLEUM IN PEACETIME

Freed from the insatiable demands of global war and from the restrictions of war, the American petroleum industry in 1946 staged a tremendous resurgence back to its peacetime role as a pre-eminent leader in the country's development. Estimates made at the beginning of the year appeared to indicate a considerably lessened national and world demand for petroleum products resulting from a greatly reduced military demand without a compensating increase in civilian demand. The fallacy of this view soon became apparent when the pent-up urge to travel by train, airplane, automobile, and ship began to manifest itself, and when the conversion and reconversion of homes and factories from other fuels to fuel oil and natural gas were limited only by the difficulty in obtaining new equipment. The end result was a new record of petroleum production and consumption, not only in the United States but in the world. More oil and gas were produced than ever before, and more were consumed. At the same time, a good start was made toward rebuilding the war-depleted working stocks of petroleum and its products.

Despite the prospect that atomic energy will become a source of power in future years, the current trend of petroleum demand indicates that requirements for this source of mobility, heat, and power will increase by 50 per cent in the first ten post-war years as it did in the decade before 1946. There is plenty of oil in the world to supply this demand for a long time, though the foreign sources of supply are increasing at a greater rate than are those within the United States. Also the rate of production is increasing more rapidly abroad than in the United States. Of the 96,000,000 barrels of oil produced in the world in 1946, only about 20,000,000 barrels were produced in the United States. Even so, the United States, with only about one-third of known petroleum reserves of the world, again produced 60 per cent of the world's oil.

U. S. PETROLEUM RESERVES

The known petroleum reserves of the United States continue to keep pace with the steadily increasing demand. Obviously, this can not be for-

[1] Natural Gasoline etc., includes related products such as liquified petroleum gases, naphthas and other liquid hydrocarbons, recovered from natural gas.

[2] Preliminary, subject to revision.

ever true, because oil discovered and produced depletes the future supply, despite the fact that petroleum is still originating and accumulating in the ocean-floor sediments of the seas. However, the oil that is now being used represents the slow accumulation of perhaps 200,000,000 years, compared with which our 87-year-old oil age is young indeed.

Petroleum, which includes the gaseous, liquid, and solid hydrocarbons of natural origin, is slowly but steadily changing in aspect. As the wells of the United States become deeper, their production trends more toward the lighter hydrocarbons such as natural gas and the crude oils rich in distillates and gasoline. Though such deep oilfields cost more to find and produce, their product is more valuable; a higher percentage of recovery may be obtained by proper practice, and greater efficiency of operation may be attained.

During 1946, much of the technological progress of petroleum was in the general direction of lighter hydrocarbon utilization. As the secrets of the scientists of oil-starved Germany became available they were combined with the knowledge of our own petroleum technologists, and improved methods of converting gaseous petroleum into heavier products such as gasoline were perfected. These methods, applied to part of our great natural gas reserves, will add billions of barrels to the supply of liquid petroleums in greatest demand.

RESEARCH IN PRODUCTS AND METHODS

At the same time, the U. S. Bureau of Mines continued its active research into the production of synthetic liquid petroleum from our great deposits of coal and oil shale, and research into the further conversion of heavy oils into lighter petroleum products by various catalytic cracking methods went on unabated in the laboratories of most of the larger oil companies.

All this research is directed at maintaining far into the future the supply of the legion petroleum products which are now required in daily life. About 5,400 different direct products of petroleum are now used as such, and the number of consumer products containing petroleum products is virtually beyond estimate. The petroleum industry is unceasing in its research into new and better products and methods. When atomic energy becomes a commercial reality, it will

TABLE III

QUARTER CENTURY OF U. S. PETROLEUM PROGRESS

	1921	1946[1]	Per Cent Increase
Oil Producing States	19	26	368

doubtless be used by the petroleum industry in new processes for making new products. For example, products such as cyclohexane, hexamethyl ethane, benzene hexachloride, and spiropentane, which have been laboratory specimens for some time, are now coming into their own as uses are found for them.

SEARCH FOR OIL AND GAS

Despite the research into other sources of liquid petroleum, the search for oil and gas in the United States continues vigorously. A slight increase in the price of crude oil during 1946 and the greater availability of materials and equipment stimulated broadened exploratory activities with the net result that the nominal reserves estimated from new discoveries, plus the reserves from older fields proved by development, again amounted to more than the record quantity of oil produced, and the nation again had more known oil in its natural reservoirs than it had at the beginning of the year. Known reserves are inventoried each year by the Reserves Committee of the American Petroleum Institute.

PETROLEUM TRENDS

Petroleum maintains a relatively unchanged pattern of organization and operation. This pattern has been determined through the years by public requirements and by unceasing competition. The petroleum industry was long ago forced into its familiar integrated structure by the competitive forces that have forced every possible economy and have resulted in steadily declining prices for better petroleum products and greater service.

Small companies have found that the integration of their producing, transporting, processing, and distributing functions is as necessary for them as it is for larger companies. Size is not an index of integration, or *vice versa,* for integrated companies range from the very small to the very large. The most notable case of integration in 1946 was that of a midwest cooperative which first acquired refining facilities to assure its patrons of a dependable supply of petroleum products and then found it wise to acquire oil wells and transportation facilities in sufficient number to assure its refineries of a supply of crude oil. The process continues and the result is better service to petroleum consumers.

In 1946, the Senate special committee investigating petroleum resources, made a thorough study of the American petroleum industry. Concerned

1946[3]	1,845,384	135,269	158,081	515,000	1,768,973

[1] Includes production of all raw materials, that is, crude petroleum, natural gasoline, liquefied petroleum gases, and benzol.
[2] New basis for comparison with succeeding year.
[3] Preliminary, subject to revision.

principally with petroleum reserves and petroleum trends, the report of the committee contained the following pertinent excerpts: "It was United States oil that made this country the industrial leader of the world." "The best evidence available would indicate that the land area of Russia is a greater potential source of petroleum than continental United States." "This discovery, production, refining and distribution of petroleum and its products are operations too complex and costly to be feasible for individual enterprise, but may be conducted efficiently and profitably only by corporation organizations." "It should not be assumed that all future warfare will occur beyond our boundaries. If invaded we would naturally rely first upon local reserves." "Nothing should be done to weaken the capacity of domestic reserves and every possible step should be taken both to increase these reserves and continuously to develop them to such a degree as would occasion no regret in the event of war."

INTERNATIONAL ASPECTS

The steady and irresistible entrance of petroleum in world affairs has been on such a vast scale as to be understood only by an observer of near-infinite perspective. The dominance of the United States petroleum-wise is best illustrated by pointing out that our use of petroleum products amounts to 367 gallons per person annually, while the corresponding figure for the entire world is only 37 gallons. For Europe, the consumption averages 31 gallons per person per year, but in Asia it is only four gallons.

This outstanding petroleum dominance of the United States is at once a credit and a challenge to the petroleum industry. It is a story of far-flung exploration, of tremendous expense and effort, of constant adjustment to meet ever-changing conditions, and of vision, initiative, and willingness to venture that our nation and the world may not want for oil.

American oil men and American oil-field equipment operated in widely remote parts of the world in 1946. Next to the United States and Canada, the greatest concentration of American skill and tools was in Colombia and Venezuela. The fabulous oil countries of Iran, Iraq, Saudi Arabia, and Kuwait were other centers of great activity and development as new production records were established in 1946 though producing only a fraction of the oil there available.

The petroleum reserves of Saudi Arabia are known to be so great that two more of the great oil companies of America felt impelled to acquire substantial interests in the Arabian American Petroleum Co. which holds a concession on most of the probable oil territory in that country. This will give five large American companies the bulk of the production there, and plans are already far advanced to build two great pipelines from the oil fields to Mediterranean ports. When these pipelines and all auxiliary installations are completed it is probable that production from the Persian Gulf region will soar to more than 1,000,000 barrels daily. This production will supply Europe, Africa, Australia, and Asia with more oil than they have ever had before and, to the extent that it supplants Venezuelan oil on the European market, will make more oil available for the United States if our own wells can not produce oil at a rate sufficient to meet demand.

This subject of efficient production rates recalls the fact that had it not been for the practice of improved production techniques and sound measures of conservation during pre-war years we would not have had the 500,000 barrels daily of reserve capacity that we needed to win the war. Without this reserve capacity, either the war would have been prolonged or rationing of unbelievable severity on civilian consumption would have been imposed. The value and importance of conservation as an essential part of petroleum economy is obvious.

Many of the men who aided in producing the flood of oil that made victory certain are now working far from the scenes of wartime activities. Some are in northern Alaska searching for the oil deposits of the Fourth Naval Petroleum Reserve; some are working in bleak Tierra del Fuego where they have found the first Chilean oil field; others are in southern France helping to develop what promises to be a large gas-distillate field; still others are in New Guinea, Nigeria, Egypt, Mozambique, Brazil, and China. All are searching for the oil of tomorrow.

HIGHLIGHTS IN U. S. OIL

Nearly 3,000 more wells were drilled in 1946 than in 1945. Although 29,228 wells of all kinds were drilled, the number falls far short of the record 33,075 wells of 1937, but represents a gain of nearly 10,000 wells over the war low of 19,431 in 1943 when every ton of steel had to yield the utmost possible oil.

The number of dry, unproductive wells drilled in 1946 soared to 8,050, a new record which is indicative of the vigor with which the search for oil is being conducted and the risks which attend it.

The 15,851 oil wells completed in 1946 fell far below the average of pre-war years, but the 3,090 gas wells completed were a new record, indicating the growing importance of natural gas in the petroleum economy of the country.

TABLE V

WELLS COMPLETED IN THE UNITED STATES

Year	Oil	Gas	Dry	Service	Total

[1] Preliminary, subject to revision.

At the end of the year, the 226,000,000 barrels of crude oil in storage constituted approximately 46 days of supply, as compared with 48 days at the end of 1944 and 95 days at the end of 1937. In terms of days supply of crude oil in storage, these figures indicate what the war did to the relative supply of crude oil in surface storage.

During the closing years of the war a variable subsidy was paid to the marginal crude oil producers of the country. This subsidy was designed to maintain the production and prevent the abandonment of high-cost wells whose production was necessary to hold U. S. production at the required levels. With the general abandonment of wartime controls, all crude oil prices gradually reached the competitive levels necessary to maintain the production required to meet unprecedented peacetime demands.

While the capacity of U. S. refineries remained virtually unchanged during the war years, their effective capacity for higher quality products increased many times. Thus, the refinery capacity of the country today can be measured in terms of 100 octane gasoline, finer lubricants, and better fuels than could be produced in only experimental quantities before the war. With a current capacity of approximately 5,300,000 barrels daily, the refineries of the country continue to maintain the bare working margin over demand that practical operating procedure requires.

Although the production of motor fuel declined slightly during the year as did the production of residual fuel oil, this drop was nearly compensated by the increased production of gas oil and distillates which continued to enjoy a sensational increase in demand. Whereas gasoline and heavy fuel oil are essentially single-purpose products, the demand for the middle dis-

[1] Preliminary, subject to revision.

During the year, U. S. imports of petroleum increased to 135,000,000 barrels, while exports decreased to 158,000,000 barrels, thus narrowing the margin in our favorable balance of trade.

In a year marked by strikes and industrial unrest, the petroleum industry remained relatively unaffected because of its high wage standards and good working conditions. Approximately 1,250,000 persons were employed by the industry as the year ended.

SCOPE OF THE OIL INDUSTRY'S OPERATIONS

Although a group of 21 so-called "major" companies continued to be responsible for more than half of the petroleum produced and sold in this country, the total number of companies engaged in the petroleum industry remained firm at about 35,000 which includes some 13,500 producers, 500 transporters, 400 refiners, 20,000 distributors and marketers, and 600 supply and service units. With this

1946[1]	809	118.84	49.19	168.03

[1] Preliminary, subject to revision.

number of competitive enterprises, it is not surprising that intense rivalry prevails. Such competition, with the resulting economies and continual progress, is responsible for petroleum prices being the least inflated of all major commodity prices. According to the U. S. Bureau of Labor Statistics, the index of petroleum prices is now only 73.1 compared with the basic 1926, while the index figure of all commodities is 134.1 or more than twice that of petroleum. This index does not include gasoline taxes, which since 1926 have more than trebled to the average motorist. Despite old cars and war-worn highways, the 1946 consumption of gasoline set a new record average of 809 gallons per car, costing $118.84 plus $49.19 in taxes, a rate of more than 40 per cent.

1944[1]	1,811,658,000
1945	1,902,037,000

[1] Revised.

As the year drew to a close, public interest was claimed by the prospects of converting the idle "Big Inch" pipe lines to gas carriers. These two great arteries of petroleum, which performed such outstanding war service in carrying Texas oil to the submarine-menaced Atlantic Seaboard, have been offered by the War Assets Administrator to the highest bidder, and indications are that the lines will be put into service to bring gas from Texas to New York's millions. With the installation of the necessary compressor stations, as much as 400,000,000 feet daily may be delivered to the New York area. This amount of gas is equivalent to about 16,000 tons of coal or about 70,000 barrels of oil and would provide another choice of fuels for thousands of homes and industries.

With the advent of 1947, the American petroleum industry faces a continuation of the trends that have brought great opportunities of service and great responsibilities for the continuance of that service.

DIVISION XIII

MANUFACTURES AND TRANSPORTATION

CONDITIONS IN MANUFACTURING

By L. Seth Schnitman
Consulting Economist

GENERAL

Uncompromising chauvinism on the part of management, labor, and government alike may be set down as the cause for the stop-and-go industrial productive patterns of 1946. Here we were with a capacity to produce and market goods on a volume level never before attained, not even in wartime; here, too, with a demand that was real and a purchasing power that was unquenchable and unquestioned. Yet, as always in the past, capacity and output turned out to be two things apart.

Again we had engaged in shadow-boxing, in the costly game of rearing straw-men only to knock them down. Strikes had succeeded in costing 5,000,000 workers—about 9 per cent of the total labor force—about 113,000,000 man-days of lost work at a direct cost to them of no less than $1,250,000,000 in lost wages. Lost man-days of production in 1946 not only were three times as great as in 1945, the highest previous year of record, but also equaled the combined total for the seven years immediately preceding Pearl Harbor. Worse, were the overall effects on the economy at large which had otherwise readied itself for a speedy return to peacetime pursuits and a stable price level. Far from affording that, producers almost everywhere became involved in the vicious pastime of pricing themselves out of their markets, while all about them were consumers ready and willing to buy at a price and in numbers never before seen. What occurred to American industry in 1946, and its components, is best reflected by the index of industrial production of the Board of Governors of the Federal Reserve System.

INDEX OF INDUSTRIAL OUTPUT

For the third consecutive year now, the combined production by our mines and factories was lower, by volume, than in the preceding year. How far the 1946 index has slipped from the all-time peak level of 1943 is best seen from the progressive deterioration that has since occurred. As above defined, the shrinkage in industrial output between 1943 and 1944 amounted to slightly less than 2 per cent; between 1944 and 1945, to almost 14 per cent; and between 1945 and 1946 to about 16 per cent. The over-all loss in 1946 production from the 1943 high-water mark approximated 28 per cent.

Were this the likely end to the decline from our peak wartime industrial effort, there would be little point in laboring the causes or even mentioning them again—pernicious industrial strife, confusion as to price-wage-profits relationships, dislocations between durable and non-durable goods manufacturing, sheer speculation in commodities, securities, even real estate. These have been sufficiently sketched in reviews in this section of The American Year Book for the preceding two or three years. Yet, because these forces are still insidiously at work, it appears especially timely now to caution that further over-all retrenchment in industrial output is all but a certainty for 1947.

Despite the production cut-back since 1943, however, the output of our mines and factories in 1946 was 71 per cent higher than the annual average for the five years, 1935-1939; almost 6 per cent greater than in the highest pre-war year, 1941; about 37 per cent in excess of the total for the next highest year before Pearl Harbor, 1940; 51 per cent larger than in the third highest pre-Pearl Harbor peacetime year, 1937; and more than 55 per cent greater than in the oft-referred-to lush year, 1929. In those years the capacity of our composite industrial plant was much smaller than it is today. Were it otherwise, our economy could take a further shrinkage in output in stride and without serious repercussions. If we are rationally to avoid the despair and heartbreak of another economic breakdown, our sights must, therefore, now be trained upon newly found production potentials. More, it must somehow be contrived to provide the proper facilities for full production and hence, for full employment, a responsibility collectively resting upon management, labor, and government.

For manufacturing alone, apart from mining, the 1946 production index was almost 18 per cent lower than that for the previous year, most largely because of the work-stoppages precipitated by unparalleled management-labor disputes and disputes between warring factions within the ranks of labor itself. Even so, the 1946 volume of manufacturing output was some 77 per cent higher than the average for the five-year period, 1935-1939, against the prediction here, a year ago, that it was "likely to be at least 75 per cent higher."

DURABLE MANUFACTURES

More revealing than either the index of industrial output or that for manufacturing as a whole are the two major components of the combined index of manufacturing production, *i.e.*, the index for durable goods, and that for non-durables. The 1946 volume of durable goods production, including such items as iron and steel, machinery, automobiles, non-ferrous metals, lumber and its products, and other building materials, was 30 per cent smaller than in 1945 and almost 47 per cent below the level of 1943. Earlier year-to-year losses since 1943 were 2 per cent for 1944 and 22 per cent for 1945. Notwithstanding, the volume of durable goods produced during 1946 was 93 per cent above the annual average for the period 1935-1939. Except for 1941, the level for which it missed by only a scant 4 per cent, 1946 production of durables was far above the total for any peacetime year. To illustrate, the increase over 1940, the previous peak year, amounted to 40 per cent; the gain over 1937 output was 58 per cent; the advance over the level for 1929 amounted to 46 per cent.

But for crippling strikes in the steel, automobile, and soft coal industries, to name but a few, the 1946 production of durables would have been even farther out in front. How distorting these strikes were may be reflected in some part by the contrasts with 1945 production totals taken at half-year intervals. Thus measured, production of durables during the initial half of 1946, when strike-bound incidences were at their peak influence, was 48 per cent smaller than in the corresponding period of the previous year; for the latter half of the year, on the other hand, 1946 output was only about 2 per cent behind the corresponding total for 1945.

Even under the best of conditions, it is not likely that the first half of 1947 can turn in an output of durables as large as that shown for the initial half of 1945, though it is virtually certain that the outturn will exceed the total for the initial half of 1946. The aggressiveness with which the transcending problems inherited from the preceding year are met and solved will sizably condition the production volume for the final half of 1947. As matters stand at the opening of 1947, the decline for the first half year from the corresponding period of 1945 is likely to approximate 25 per cent while the latter half of the year is almost certain to show an even more material sloughing from the volume for the like period of 1945. Worse, output for the last half of 1947 appears destined to slip behind the volume for the final six months of 1946.

NON-DURABLE MANUFACTURES

Unlike durable goods, non-durable manufactures in 1946 were produced in practically the same high volume of the preceding year, for an all-time record for peacetime. With this performance, the year's total was within 6 per cent of the all-time high for non-durable goods production in the war year 1943. In this disparity between durables, and non-durables such as textiles and their products, leather and its manufactures, manufactured foods, and other manufactured commodities for quick consumption, lies the clue to the industrial outlook as a whole for the year 1947. It seems to say that not only was the transition from war to peace in respect to non-durables relatively painless but also that we are near the point where, for the time being at least, supplies of consumables are generally about to outrun demands, making necessary some sizable cutbacks in production. If further evidence were needed, it was rather amply afforded during the closing weeks of 1946 when sporadic though not entirely isolated or unrelated price concessions appeared to have marked the beginning of the transition from the so-called sellers' market to the buyers' market so long in eclipse. All the while, however, it should be noted that, though the production of non-durables in 1946 was some 66 per cent greater than the annual average for the five years 1935-1939, income payments to individuals in 1946 averaged about 140 per cent higher than in that same base period.

With the requirements for the military now only a shadow of what they were—their needs for food, clothing, shoes, paperboard, and countless other consumables—is it academic to ask, can the high level of income payments alone insure a sustained record-breaking level of production for non-durables under conditions that are rapidly taking on temporary aspects of satiety at the prevailing level of prices? For a possible hint to the answer, another look at the 1946 production figure for non-durable commodities is appropriate, this from the point of view of profound contrasts. The 1946 production of non-durables was 17 per cent greater than the all-time high for the entire pre-Pearl Harbor period recorded in 1941. As significantly, the 1946 total averaged 46 per cent greater than the annual volume for the five highest peacetime years of 1936, 1937, 1939, 1940, and 1941.

PRODUCTION INDEXES FOR DURABLE AND NON-DURABLE MANUFACTURES[1]

(1935–1939 Annual Average = 100)

Year	Durable	Non-durable	Ratio: Durable / Non-durable
1919	84	62	1.35

[1] Basic data from Board of Governors of the Federal Reserve System. Ratios for specified years computed by the author.

[2] Revised.

[3] Preliminary.

RELATIONSHIPS BETWEEN DURABLE AND NON-DURABLE MANUFACTURES

As indicated in these reviews for some years, a sound economy requires approximate balance between durable goods manufacture and the production of non-durables. Only in this way can the products of the one be fairly exchanged for those of the other. Whether relative balance exists can be easily determined by striking a ratio between the two for any period. When the ratio is 1.00 or unity, as it was in 1939, there is balance and, hence, a basis for sustained manufacturing production; when materially above 1.00, the ratio generally portends gathering storms for manufacturing output as a whole; contrariwise, when below 1.00, the ratio usually points to clearing skies and a broad basis for recovery in manufacturing activity. Commenting on the ratio in THE AMERICAN YEAR BOOK for 1945, it was stated: "Though the table below discloses that the 1945 ratio was measurably lower than the ratio for 1944, it seems to say that further downward readjustment in production is ahead." Such, too, is the barometric reading from the 1946 ratio for 1947 output.

FOOD PRODUCTS

The index of manufactured foodstuffs production for 1946, at about 150 per cent of the average for the base period (1935-1939), showed only a fractional drop from the level of 1945 and an increase of almost 5 per cent over the level for 1943. A look at the composition of the 1946 index is particularly instructive in that it discloses, except for processed fruits and vegetables and manufactured foods other than wheat flour, dairy products, and meats, that the 1946 combined measure of manufactured foods production would have shown a more material and perhaps a more realistic drop from the 1945 level, even though the 1943 level may not have been violated. To illustrate the contradictions, the loss in wheat flour production from 1945 was about 1 per cent; in manufactured dairy products as a group, the shrinkage was 6 per cent; in meat packing as a group, about 8 per cent; while the gains in processed fruits and vegetables, and in other manufactured foodstuffs as a group, amounted to 13 per cent and 2 per cent, respectively. Butter production sloughed almost 14 per cent from the previous year's total to a level that was only 69 per cent as high as the average in the five-year period 1935-1939. Cheese output was fractionally below the level for 1945 but 64 per cent higher than in the base period; the output of canned and dried milk in 1946 recorded a loss of 16 per cent from the preceding year but remained 54 per cent above the level for the years 1935-1939.

Progressively, in 1946, shortages in foodstuffs were fast giving way to surpluses, especially noticeable in the case of goods of inferior quality inventoried during the months when distributors and consumers alike would take anything they could get in the way of processed foods, canned goods, and, to a lesser extent, frozen foods. Now, the foodsellers' honeymoon is about over. Sensing a break in prices, housewives generally are more critical of quality and less panicky in filling their larders. Only shortages of sugar, fats, and oils remain as vestiges to remind them of the tighter days of the war years when anything that was labeled food seemed more desirable than money.

All this spells further readjustment. Unsettling though it may become, as indeed it has already in respect to relatively nondescript brands of canned citrus fruit juices, this readjustment will serve to level existing distortions in price relationships before 1947 has run its full course. In this pattern, producers and distributors of frozen foods are especially likely to be badly hurt. Thanks to the sustained high incomes of the population, however, retail sales of food in 1947, measured in dollars, are not likely to fall materially below the sales of 1946, which totaled more than $21,000,000,000. Though the price level was much lower then, 1939 food store sales amounted only to a scant $10,000,000,000.

CONFECTIONERY, LIQUOR, TOBACCO

Though not as acute as in 1945, the continuing shortage of sugar operated to put an effective ceiling over the production of candy and confections, with the result that the index of output for 1946 was almost 5 per cent lower than for 1945. Meanwhile, candy output was still some 23 per cent greater than the average for the five-year period 1935-1939. On the other hand, alcoholic beverages as a group were produced in 1946 in a volume almost 10 per cent greater than in the previous year and 95 per cent heavier than in the five-year base period. Whiskey production alone scored an advance over 1945 output of 20 per cent; rectified liquors, of almost 30 per cent; other distilled spirits, of about 48 per cent. Malt liquors, on the other hand, declined almost 5 per cent from 1945. With consumption of whiskey, wines, and beer never higher, inventories of aged domestic whiskies were meanwhile further reduced; at the 1946 year-end whiskies in government-bonded warehouses totaled no more than about 300,000,000 gallons in contrast with about 415,000,000 gallons at the end of 1941. Except for imported Scotch, prospects for more whiskey are brighter now that the Government has revoked its wartime controls governing the use of corn for whiskey production; normally, about two-thirds of all domestic whiskies are distilled from corn. With all restrictions on the use of beer grains now removed, larger production of beer appears assured for 1947.

Smokers consumed almost 6 per cent more cigarettes in 1946 than in 1945, again a new high record. The total of about 350,000,000,000 was virtually twice the cigarette total for a year as recent as 1939. Not even the use of cigarettes as an auxiliary currency off-continent could account for this spectacular increase in consumption of American-made cigarettes. Not to be outdone, cigar smoking, too, gained substantially in 1946 over the previous year's total, though the increase over the 1939 consumption volume was much less spectacular. The 6,000,000,000 total for 1946 was some 11 per cent greater than that for 1945 and almost 16 per cent in excess of the 1939 consumption total.

TEXTILES, SHOES, APPAREL

The output of textiles and their products in 1946, in the aggregate, broke all earlier records. In exceeding the 1945 volume by some 11 per cent, 1946 production was 62 per cent higher than the average for the five-year period 1935-1939. Cotton, rayon, and wool textile fabrics hit new highs both in yardage and in dollar volume. Cotton textile production approximated 10,200,000,000 square yards; apparel woolens and worsteds exceeded 500,000,000 yards; rayons, in passing the 1,800,000,000-yard figure, established a new all-time high record of production. The clothing lines, too, whirred at unexampled peacetime speeds. Meanwhile, the quickening in the production of dresses, ladies' coats and suits, hosiery, underwear, millinery, accessories, and men's shirts, especially in the final quarter of the year, brought with it a noticeable softening in prices to the consumer as the year came to a close. Fur prices were also badly hit, in part, to be sure, by the relatively open early winter months in the heaviest consuming regions though more significantly because of an earlier near-collapse in the raw skin markets. Notwithstanding high production schedules, men's clothing continued in short supply almost to the end of the year, with prices firm to up.

The output of leather and leather products taken as a group was slightly more than 4 per cent greater in 1946 than in the preceding year and about 22 per cent higher than the average for the five years 1935-1939. Leather tanning alone, thanks to the meat production-price fiasco of midyear, was almost 6 per cent less than in 1945 and was but 7 per cent ahead of the annual average for the base period. Shoe output, on the other hand, scored a gain of about 11 per cent over the volume of 1945, and, in so doing, was about 33 per cent ahead of the average for the five years ended 1939.

If any general recession in business occurs in 1947, it is most likely to be sparked by declining demand for clothing items of every description;

induced by consumer uncertainties over the extent of probable price declines. This phenomenon is likely to cut deep into the profits of merchants and manufacturers alike and bring with it an increase in failures.

PETROLEUM AND REFINERY PRODUCTS

The 1946 output of domestic crude petroleum was larger than for any other year. At the same time, foreign production exceeded all earlier records. The lull in domestic demand for petroleum and its products, generally expected to come with the cessation of fighting, failed to materialize; thus, the transition from war to peace was handily the most orderly of that for any of the other basic industries. Increased use of passenger cars; enlargement of the truck and bus population, and extension of their runs; expansion in the dieselization of railroad systems; increased conversion of coal-burning heating and power equipment; enlarged uses of derivatives in the chemical, pharmaceutical, and plastic industries; all these factors and more accounted for the rapid change-over and the ease with which the industry produced for a waiting market the record total of about 1,730,000,000 barrels of crude.

Gasoline output approximated 750,000,000 barrels in 1946. This was, to be sure, a loss of about 3 per cent from the output of 1945, the all-time high. Nevertheless, in the face of the tremendous cutback in the demand for gasoline for war needs, it is little short of astounding that gasoline production in 1946 was 40 per cent higher than the average for the five years 1935-1939, when passenger car population was sizably greater than now. Fuel oil production was about 1 per cent higher in 1946 than in the previous year; lubricating oils were produced in 10 per cent greater volume; while the increase in kerosene output over the total for 1945 exceeded 30 per cent. Since refineries are likely to rely in 1947, more heavily than ever before, upon imports of crude oil to meet expected high demands for derivatives of every description, it is not likely that any material gain in domestic production of crude will occur in 1947. Especially would such be the case if reciprocal trade treaties respecting petroleum are to be further extended, as is altogether probable. (See "Petroleum.")

PAPER AND PAPER PRODUCTS

The paper industries, hard-pressed for supplies during the war years, were generally better off in 1946 than at any time. The combined index of production was 5 per cent higher than in 1945 and averaged 46 per cent greater than for the five-year period 1935-1939. But for continued tightness in respect to pulps, production of which was only fractionally larger than in 1945, the 1946 production of papers of every description would have been materially higher. Excluding pulp, paper production alone was about 6 per cent greater than in 1945 and about 40 per cent higher than the average for the base period. Gains over the production in 1945 were recorded for paperboard, printing papers, tissue and absorbent papers, and newsprint; wrapping papers, however, suffered shrinkage. For all but newsprint, the 1946 figures were higher than the average for the five-year period ended 1939; the loss from that period in newsprint production averaged 15 per cent.

CHEMICAL PRODUCTS

The index of chemical products manufacture in 1946, entirely because of losses in explosives and in soap production, declined 17 per cent from the level of 1945. Notwithstanding, the total combined output of chemical products was 136 per cent higher than the annual average for the five years 1935-1939. Paint output in 1946 was some 7 per cent greater than in the preceding year and almost 50 per cent higher than in the base period. It was in the rayon and industrial chemicals fields, however, that the most sustained forward march occurred. Rayon fiber production in 1946 was virtually 10 per cent higher than in the previous year, for a new all-time record; industrial chemicals output, at almost four times the average level for the period 1935-1939, showed an increase of about 1 per cent over the previous year's total. Soap production, short of essential fats and oils, suffered a loss from 1945 of about 8 per cent, much to the discomfort of the buying public. Even so the output was some 20 per cent heavier than during the base period.

RUBBER PRODUCTS

The output of all classes of rubber goods, as measured by the combined index, was about 4 per cent smaller in 1946 than in 1945. The index, however, was 106 per cent higher than the average for the five-year period ended 1939. Approximately 66,000,000 passenger car tires were produced in 1946, a gain of better than 30 per cent over the volume in 1940. At the same time, the 1946 output of casings for trucks and busses totaled almost 16,000,000 for a gain of more than 90 per cent over the best previous peacetime year. Of the 1,000,000 tons of rubber consumed in 1946, almost half was crude rubber as distinguished from synthetics, with the likelihood that henceforth synthetics will form a smaller proportion of annual consumption than crude.

MINE OUTPUT

The 1946 record of mining output—copper, silver, coal, iron, petroleum, lead, zinc, and gold—unlike manufacturing output, almost equaled the total for the previous year. The loss from 1945 was hardly more than 2 per cent. Contrasted with the average for the five years ended 1939, 1946 showed a production total 35 per cent greater.

ELECTRIC UTILITIES, EQUIPMENT, AND HOUSEHOLD APPLIANCES

What a sustained high level in the national income can bring to the population is strikingly reflected by the 1946 figures on the consumption of electricity. Not only were more than 1,750,000 new customers added to the ever-widening band of users during the year but also no less than 100 kilowatt hours more were consumed by the average residential user in 1946 than in the previous year, for a new all-time record, and at unit rates that were generally lower than ever before. Only consumption of electricity by industrial users failed to scale the 1945 total, this because of the disappearance of production of goods for war. At the year-end, however, even the demands from industry for electric power seemed poised for a break-through to new high levels.

The year's outstanding achievement occurred in the field of rural electrification, reflective of the improved financial position of the farm population. During 1946, some 500,000 farms, never before blessed with central station electric power, were connected for service, leaving now only about 35 per cent of all occupied farms without central electric power.

Total production of power by all utilities, exclusive of power produced by industry for its own use, was only fractionally greater than in 1945, but the total of almost 223,000,000,000 kilowatt hours would have been even greater but for the conservation that was ordered during the bleak days of the soft coal strikes and the work stoppages in industry forced by the general industrial strife that characterized the year 1946. These strikes all but killed off the expansion planned for generating capacity.

Of the anticipated addition to capacity of almost 1,500,000 kilowatts, only about 150,000 were installed during the year, not only because of strikes against manufacturers of the needed electrical equipment but also in the steel industry and other metal industries. These strikes, too, blighted manufacturing records for the entire field of domestic electrical appliances, dependent as they are on steel, copper, and lead. As 1946 ended, however, the production lines for household electric refrigerators, electric ranges, radios and television sets, washing machines, electric irons and toasters, and for countless other items, were generally more active than ever before. If there is one concern that yet remains, besides the possibility of further atrophying strikes, it lurks in the growing glut of appliances of inferior quality that already are giving the retail market a ragged appearance.

RAILROADS AND RAILROAD EQUIPMENT

Never before in peacetime did the railroads of the nation move so much traffic or so many passengers as in 1946. Yet, only by an across-the-board increase in freight rates averaging 17.6 per cent granted them by the Interstate Commerce Commission as the year was almost over, were most of the rail systems assured of relative freedom from financial embarrassment. Great were the inroads of higher operating costs—increased wages and salaries, higher maintenance charges, higher prices for the materials, equipment, and supplies they must buy to maintain their standards of service and yet compete with other modes of transportation. In 1946, the railroads spent more than $500,000,000 on capital improvements of which about 55 per cent went into new locomotives, freight cars, and passenger equipment, with the remainder going into road improvements and new structural facilities. Purchases of fuels, materials, and supplies alone amounted to $1,600,000,000 for a new all-time dollar total.

IRON AND STEEL

Strikes, within and without, cost the steel industry, and the economy as a whole, some 16,000,000 tons of lost ingot production. Better to judge the meaning of this irrevocable loss, it might be indicated that, reduced to the requisite forms, such tonnage would be sufficient to fashion 8,000,000 passenger automobiles! How the steel strike, itself, early in the year, breakages in the supply lines to it, and the two protracted strikes in the soft coal industry, retarded the processes of transition from war to peacetime pursuits is otherwise portrayed by the 1946 ratio of production of steel to industry capacity. This ratio, at 72, appears to say that were the industry going full-tilt at its war-expanded capacity of 92,000,000 tons, it could have produced 26,000,000 tons more of ingots than were turned out in 1946. It was a high toll for blunders, for stubbornness, and for the other human frailties, when all about there was but one insistent demand: Give us steel! This cost accents the need for clearer thinking against the day when steel demands may not be as pressing as they were in this first post-war year.

Notwithstanding, the year's output of steel, approximating 66,000,000 tons of ingots, was the greatest of any peacetime year and exceeded the 1929 pre-war record by about 9 per cent. Measured by the combined index of the Board of Governors of the Federal Reserve System, iron and steel production in 1946 was about 17 per cent lower than in 1945. Nonetheless, the index for the year was some 51 per cent higher than the average for the five years 1935-1939. The output of pig iron alone was about 16 per cent lower than in 1945 and 26 per cent below the 1943 level, while steel production in 1946 registered losses of 18 per cent from the previous year and 26 per cent from 1943. High-grade and special steels produced by electric furnaces sustained a much deeper loss from either 1945 or 1943 than did steels produced by the more conventional open-hearth process; the losses from 1945 alone amounted to 26 and 16 per cent, respectively. Beehive coke, an essential material in the steel-making process, suffered a production cutback from 1945 of 16 per cent while steel scrap remained in relatively tight supply.

By the 1946 year-end, the Federal Government had succeeded in disposing of the steel plants it had built for war needs; in the aggregate, these had a capacity of almost 6,000,000 tons. Costing approximately $500,000,000, they were sold at substantial discounts to the companies which had operated them during the war. With conversion of these plants to peacetime uses and with general rehabilitation of remaining plants, the ingot capacity appears adequate for all foreseeable needs. The completion of projected additions to sheet and strip plants planned for 1947 will add materially to the capacity of finishing facilities, thereby holding promise for an early break in the tight supply situation that has obtained hitherto.

It is now rather clear that the maddening race between prices, wage rates, and profits is fast drawing to some kind of a climactic close. In any event, further pressures for higher wage rates and the concern over the problematical costs to the steel industry arising out of the portal-to-portal decision in the Mount Clemens Pottery Company case, may be relied upon to spur the steel companies materially to reduce their unit costs of production. Already there are evidences that the technique of oxygen-use in steel-making has gained acceptance. Shown experimentally to speed production in both open-hearth and blast furnaces by no less than 25 per cent, this improvement in method could alone bring substantial reductions in unit prices to consumers. (See "Iron and Steel.")

NON-FERROUS METALS

Non-ferrous metals, as a group, were produced in 24 per cent smaller volume in 1946 than in 1945; yet, the 1946 index of output was 55 per cent above the average for the base period (1935-1939). Operations of smelters and refiners were about 23 per cent lower than in 1945 while fabricators showed a shrinkage in operations from the previous year amounting to 25 per cent.

Refined copper production approximated 600,000 tons compared with 843,000 tons in 1945 and the 1943 wartime peak of 1,207,000 tons. Aluminum output amounted to about 850,000,000 pounds for a loss of some 250,000,000 pounds from the wartime record. Domestic lead output and zinc production, too, declined in 1946, chiefly because of labor troubles at the mines. For lead, the 1946 production figure was only about 85 per cent of the total for the previous year and smaller than for any year since 1935. For zinc, chiefly because of strikes against smelters, the 1946 output volume was smaller by some 9 per cent than in 1945 and was lower than for any year since 1938. Silver output declined, too, in 1946; the loss from the preceding year, amounting to 25 per cent, forced the figure to a level lower than that for any year in about 75 years. Not even higher prices afforded under the recently enacted silver purchase law could counteract the adverse effects of protracted strikes at the copper and lead mines where silver ores are usually found. (See "Non-Ferrous Metals.")

AUTOMOBILES

As in the preceding year, the greatest disappointment of 1946 occurred in the automobile industry, for which production estimates had ranged as high as 6,000,000 cars and trucks. In striking contrast, the realized total was less than 3,100,000 units, of which passenger cars accounted for about 2,150,000 units and commercial vehicles for about 940,000 units. With the essential needs for personal transportation equipment far from satisfied, it was no accident that passenger car production in 1946 was some 43 per cent below the pre-war total for 1941, nor that truck assemblies recorded a loss from that year of 11 per cent.

Again, strikes and lockouts in the industry, in parts and accessory plants, in the steel industry, in the soft-coal mines, in a host of other feeder industries, had left their telltale traces, not alone on the automobile industry itself, but also and worse on the entire economy of the nation. Strikes among car and truck manufacturers alone cost 110,000,000 man-hours in lost labor, and wage-earners in automobile assembly plants the staggering total of almost $150,000,000 in lost wages. If this were all behind us now, perhaps the price for sustained industrial peace would not have been too high. As 1947 dawned, however, there were gathering indications that more labor-management clouds were in the economic skies.

The climate is still otherwise right for a production of 5,000,000 passenger cars and of 1,000,000 trucks, and more, but these must be available at prices that the buying public is not only able, but also willing to pay. Today's prices are from 35 to 50 per cent above those prevailing in 1941. Should they stay up or push even higher, a total of passenger car assemblies in excess of 3,500,000 for 1947 would be a surprising performance. Now, the buying public is much more circumspect and money-wise, less likely to reach for cars at any price, and most of all, unwilling longer to pay prices which only months before had generally prevailed only in the black market.

MACHINERY AND EQUIPMENT

The output of machinery in 1946 declined 30 per cent from the 1945 total and 45 per cent from the volume for the record year 1943. As 1946 came to a close, however, it appeared that the long decline had about been arrested. In the machine tool field—special tools, jigs, dies, moulds—production in December, 1946 against special earlier specifications was some 25 per cent higher than for the same month in the previous year. More than anything else, perhaps, this reflected intensified efforts of manufacturers of metal, plastic, and a wide variety of other products to reduce their unit costs of production.

The combined index of transportation equipment production, covering automobiles, aircraft, railroad cars, locomotives, shipbuilding, both private and government, showed a loss in 1946 from the previous year amounting to 52 per cent, chiefly because of drastic curtailments in aircraft manufacture and shipbuilding. Again reflecting the unending search for lower operating costs, if not for freedom from the threat of breaks in soft-coal supply lines, it should here be noted that better than 90 per cent of the railroad locomotives manufactured in 1946 and on order at the year-end were diesel-powered.

BUILDING CONSTRUCTION AND MATERIALS

Caught amid contradictions of critical material shortages, alternate government restrictions and their relaxation, shortages in skilled on-the-site labor, and conflicts on program emphasis, to name but a few, the construction industry gave an extraordinary accounting of itself in 1946. Expenditures on new construction alone, not counting the added billions in repairs, alterations, and maintenance, were not far below $10,500,000,000. If there is greater wonder, in the face of the most perplexing array of hazards ever concurrently at work, it lies in the fact that private construction activity as distinguished from governmental work accounted for about $8,100,000,000 or about 80 per cent of the year's total for all new construction. All the same, shortages in residential space were far from filled, and, this, even though the volume of expenditures for new non-farm dwelling space reached the total of about $3,375,000,000, a level reminiscent of some of the best years in history. To be sure, the current cost level is much higher, but this has been offset in part by the trend toward smaller dwelling units. How the construction performance of 1946 was made possible may be seen from the records covering the output of principal building materials.

Lumber, recently a critical bottleneck, was produced in 1946 in a volume almost 25 per cent higher than for the preceding year, and some 22 per cent above the annual average for the five years 1935-1939. Clay products in the aggregate, such as brick, hollow tile, floor and wall tile, showed a production total that was likewise about 25 per cent greater than in 1945; the gain, here, over the five-year average was about 48 per cent. The combined index for the manufacture of gypsum and plaster products was 16 per cent higher than for 1945 and 105 per cent above the annual average for the five years ended 1939. Cement output recorded gains over the previous year and the base period of 58 and 52 per cent, respectively. Glass production and the output of other materials, too, exceeded 1945 totals, but cast-iron soil pipe and other essential metal building products, such as copper and brass pipe, wiring, nails, radiation, bathroom fixtures, provided mediocre production performance records, because of which at the year-end many residential units were kept from completion.

CONCLUSION

Perched upon an attained new peacetime height but as yet untried by adversity, where almost any breeze could seriously disturb equilibrium, American industry now faces its greatest period of test. The human approaches to the new problems, which such previously unscaled production levels have forced, and to the old problems yet unsolved, are made no easier by the full dress rehearsals of 1946. Of warring among ourselves; of full-scale conflict in China, Indo-China, and Palestine; of an orgy of domestic real estate speculation; of rancor engendered by the newly found potentials of atomic energy; of the unspeakable suffering from cold and starvation in France and Italy and in vanquished Germany and her late partner countries; of the accelerating trend toward statism in Great Britain and the expanding footholds of Communism; of a virtual babel on the domestic political front on such transcending questions as taxes, housing, and social security; of lack of vision and understanding of the longer-range beneficences of low tariffs and freer immigration and the contribution which they could make to the cause of true world peace.

Whatever else 1947 and the years beyond may bring, there can be no sound basis for sustained domestic production by our mines and factories and easy distribution of their products so long as these inheritances from 1946 and countless others continue to press for solution with only indifferent results.

UNITED STATES TARIFF COMMISSION

By Oscar B. Ryder
Chairman, United States Tariff Commission

Commissioners

Oscar B. Ryder, Chairman	E. Dana Durand
Lynn R. Edminster, Vice Chairman	George McGill
Edgar B. Brossard	John P. Gregg

Sidney Morgan, Secretary

New York Office—Room 513, Custom House
Samuel W. Pitts, In Charge

FUNCTIONS OF THE TARIFF COMMISSION

The Tariff Commission is an independent agency of the United States Government, created by Act of Congress in September 1916 (Title VII of the Revenue Act of 1916) primarily as an investigating and fact-finding agency to assist the Congress and President in matters pertaining to foreign commercial policy.

The functions and duties of the Commission were extended in the Tariff Act of 1922 by inclusion of the flexible tariff provision, Section 315; the provision prohibiting unfair acts in the importation of goods, Section 316; and the provision for penalizing the trade of countries which discriminate against the trade of the United States, Section 317. Similar provisions were contained in the Tariff Act of 1930—the act now in force—in Sections 336, 337, and 338, respectively. The Commission has added duties provided for under the Trade Agreements Act passed in June 1934 and extended in 1937, 1940, 1943, and 1945. The function of the Commission under this act is to present information regarding imported articles that may be made the subject of concessions by the United States in trade agreements. The Commission also has duties under Section 22 of the Agricultural Adjustment Act of 1933, as amended, which permits restriction of imports that interfere with any program undertaken under that act. Cotton and wheat have been subjects of investigation under this section.

The Philippine Trade Act of 1946 provides that quotas may be imposed on certain articles imported from the Philippines by the President if investigation by the Tariff Commission indicates that such action is necessary. This section becomes effective Jan. 1, 1948, but investigations by the Commission prior to that date are authorized.

HISTORY OF THE COMMISSION

In the first few years of its existence, the Commission published reports on reciprocity and commercial treaties, on colonial tariff problems, and on customs administrative laws, also a series of reports on commodities for which the First World War had raised special problems of tariff policy. In 1921, to assist in the Congressional tariff revision then under way, it issued the first edition of the *Summaries of Tariff Information* (now called *Summaries of Commodity Information*), containing data on production, imports, exports, and competitive conditions respecting all commodities involved in the import trade of the United States.

From 1921 through 1933, the Commission, in addition to its extensive activities under the flexible provisions, published a number of extensive surveys and reports on specific commodities, and expanded and brought to date the *Summaries of Tariff Information,* a constant source of reference during consideration by the Congress of the bill which became the Tariff Act of 1930.

From 1934, when the Trade Agreements Act was passed, until the beginning of the Second World War in 1939, work in connection with trade agreements constituted the largest segment of Commission activities. Other work, mainly under general powers of the Commission, continued on a substantial scale. Of special importance were the extensive reports prepared during this period on the trade and trade policies of countries such as Japan, the Philippines, Germany, and Italy. Almost as important were the reports prepared on commodities such as wood pulp, nitrates, and iron and steel, which presented special import problems.

WAR ACTIVITIES

Beginning in the fall of 1939, the Commission directed its activities largely to immediate war problems and to giving all possible assistance to defense agencies and to their successor war agencies. Almost immediately after the beginning of the war in Europe, the Commission made a study of the current and probable future effects of the war on United States imports and on the ability of this country to provide commodities necessary for defense and civilian consumption. When the Office of Emergency Management was established, it not only drew personnel from the staff of the Tariff Commission but in part of its work relied largely on commodity information compiled by the Commission's staff. As war agencies succeeded defense agencies, the cooperative activities of the Tariff Commission were increased to give every possible assistance in the prosecution of the war.

Beginning in the fall of 1943, the Commission turned increasing attention to post-war problems. At first on its own initiative and later at the request of the Finance Committee of the Senate and the Ways and Means Committee of the House, the Commission undertook the preparation of a series of special reports on the post-war foreign-trade position of the United States, as to its total trade and as to its trade in specific commodities and with specific countries.

CURRENT WORK OF THE COMMISSION

At the present time the two phases of the Commission's work that stand out in importance are the preparation of reports in response to requests from Committees of Congress and activities in connection with the trade agreement negotiations which are planned to begin in the spring of 1947. Another important phase of the current work of the Commission results from its participation in the activities of various interdepartmental committees set up to study and report on the many problems of international trade policy now facing the United States.

WORK IN DIRECT RESPONSE TO CONGRESSIONAL REQUEST

Much of the Commission's activity is carried on at the direct request of Congressional Committees. There is pending before the Commission a series of requests from the Senate Finance and House Ways and Means Committees. In response to these requests, the Commission is preparing a series of reports on United States industries which have been substantially affected by the war in such manner as to alter their competitive positions in relation to the industries of foreign countries. Notwithstanding the great pressure of other work and a severe reduction in staff, the Commission in the past year completed eight reports in this series, bringing the number of the reports in the series up to 18.

Currently the following reports in the "War Changes in Industry Series" are in active progress:

China clay
Dyes
Mica
Watches
Countable cotton cloth
Woolens and worsteds
Softwood lumbers
Starches
Oils and fats for foods and soaps
Flaxseed, linseed, and other drying oils and materials therefor
Potash
Grapes and wines
Copper (through refining)
Plastics products
Zinc
Lead
Pulpwood, wood pulp, and newsprint
Cattle and beef
Rayon, nylon, other synthetic fiber, and raw silk

Preparation of reports are pending on the changes since 1929 in the international trade policies of foreign countries, particularly as they have affected, or may affect, the trade of the United States. The Commission is issuing a series of reports on Latin American countries covering agricultural, mining, and manufacturing industries; economic controls and commercial policies; and recent developments in foreign trade. Forty reports in this series have already been issued, and 10 additional reports, which will complete the series, are in process and will be completed in the next few months. The Commission has also completed a series of studies on the pre-war commercial policies and trade of certain European countries and a similar work is in progress with respect to British Empire countries.

SENATE AND HOUSE COMMITTEES ON AGRICULTURE

Recently the Congress has had under consideration legislation to implement a policy with respect to the domestic wool industry. In the preparation of this legislation, the Special Senate Committee to Investigate Production, Transportation, and Marketing of Wool had the cooperation of representatives of the Tariff Commission during its extended hearings on wool. The Commission also furnished assistance to the Senate Committee on Agriculture and Forestry when it was considering the report of its Subcommittee, and to the House Committee on Agriculture when wool legislation was before it. Currently the Commission has in progress a study with respect to wool costs being made at the request of the Special Senate Committee to Investigate Production, Transportation, and Marketing of Wool.

WORKING OUT A POST-WAR COTTON PROGRAM

Much assistance has been given by members of the staff to the House Committee studying cotton problems. This assistance has extended over a period of more than six months. Currently most of the work is completed, but there is still some work to be done in connection with the report to be issued by the Committee.

CONSIDERATION OF THE PHILIPPINE TRADE ACT OF 1946

One of the important pieces of legislation enacted by the Congress during the past year was the Philippine Trade Act of 1946. This legislation, designed to aid the Philippines in the reconstruction of their economy which was practically destroyed by the war, was the subject of extended consideration by the Ways and Means Committee of the House and the Finance Committee of the Senate. Members of the staff were assigned to assist these Committees and a great deal of information was supplied in connection with the problems under discussion. The duties assigned to the Tariff Commission under this act are of a continuing nature.

A continuing part of the Commission's activities is the preparation of reports on pending legislation affecting tariffs and international trade.

WORK IN PREPARATION FOR TRADE AGREEMENT NEGOTIATIONS

The major part of the time of the staff in recent months has been devoted to the preparation of material in connection with the proposed trade agreements. The Administration has announced its intention of making a series of agreements with some 16 foreign countries, and the plan is for these negotiations to begin in the spring of 1947. Members of the Commission and of the staff take an active part in the work of the committees which make up the lists of articles on which duty concessions will be considered by the United States in the course of these negotiations. Practically all the data on the basis of which articles are selected or rejected for inclusion in these lists are supplied by the Tariff Commission. On each article included in these lists the Commission is preparing detailed digests which set forth not only the statistical data with respect to imports, exports, and production of each article, but summarize all the available facts regarding the competition between the domestic and the imported product and discuss the probable effect of a reduction in duty.

WORK ON INTERDEPARTMENTAL COMMITTEES

A substantial part of the work of the Tariff Commission finds expression in its contribution to the work of Interdepartmental committees. The scope of its activities in this committee work is very wide and has tended to expand in the past year. The work on these committees ranges from the Commission's important representation on the Executive Committee on Economic Foreign Policy to its representation through members of its staff on some of the subcommittees concerned with problems affecting our foreign economic policy.

WORK WITH THE UNITED NATIONS

The Tariff Commission is cooperating actively in the work of the Economic and Social Council of the United Nations. In connection with this work a senior member of the Commission's staff has been appointed as a member of the American group advisory to John G. Winant who represents the United States on the Council.

REVIEW OF CUSTOMS ADMINISTRATIVE LAWS

The Commission has in preparation a report on the operation of the customs administrative laws. This is a task assigned to the Commission as part of its organic act and a phase of the work for which there is urgent need both by the Congress and by manufacturers and importers.

SYNTHETIC ORGANIC CHEMICALS

The Commission has in progress a compilation of the data for the annual census of synthetic organic chemicals for 1945. Through the work which the Commission does on the production and sales of these products, the industry is kept advised in regard to developments in the trade as a whole, and the detail incorporated in the reports makes them especially valuable to those in the Government concerned with the administration of laws relating to these products.

The Commission also issues

monthly a statement covering the production of a limited list of synthetic organic chemicals which carries forward the work undertaken by the War Production Board which proved so valuable that the Bureau of the Budget has approved its continuance on a smaller scale.

NEW YORK OFFICE

The Tariff Commission supplements the information on imports contained in published statistics of the Department of Commerce through more detailed data obtained by a small force which it maintains in New York. This office analyzes the entry papers and obtains data needed by the Commission or by other government agencies. The data so obtained find their way into the summaries of commodity information, and some that are of particular value to the trade are issued for public distribution.

WORK UNDER SPECIAL PROVISIONS OF LAW

In addition to the work previously referred to on trade agreements under Section 350 of the Tariff Act of 1930, as amended, the Commission has in progress an investigation with respect to harsh or rough cotton having a staple of less than ¾ inch in length under Section 22 of the Agricultural Adjustment Act, as amended. There are no investigations pending under other special provisions of law.

ADMINISTRATION OF THE TARIFF LAWS

By C. A. Freeman
Division of Fiscal Administration, Bureau of Customs,
Treasury Department

GENERAL

Back to normal after the end of the war, the hope and expectation of American producers and consumers alike, were no more realized in our foreign trade during the fiscal year ended June 30, 1946 than they were in our domestic economy. Trade, both with Europe and the Orient, had to wait first for the return of the boys in uniform from the far flung theaters of military operations, and even when bottoms were available for mercantile purposes, the production of goods for export to this country was slow to develop in those areas long occupied by Nazi and Nipponese forces. Consequently, months elapsed before the first driblets of goods, long absent from and eagerly awaited in the American market, began to arrive from China and central Europe. No imports of any consequence except pearls were received from Japan, while the only importation of any magnitude from Germany consisted of hops valued at a little over $2,000,000 brought to this country in May.

CUSTOMS COLLECTIONS

Following the mild upward trend which prevailed in most of 1945, customs collections continued to increase at a more rapid tempo during 1946. The total of $440,725.085 exceeded by 23 per cent that of 1945 ($358,138,757) and was greater than for every year but one (1937) since the passage of the present Tariff Act on June 17, 1930. This rise was not continuous, however, recessions occurring in December, February, and June with successively higher peaks in October, January, and April.

Increased collections were received from all types of entries except informal entries (those valued at less than $100), the sharpest rise being in the case of baggage entries and mail entries which reflected respectively the growing volume of tourist travel and the greater importance of commercial importations by mail. Duties on consumption entries during 1946 increased to a considerably greater extent than those on warehouse withdrawals, owing partly to immediate

VALUE OF DUTIABLE IMPORTS FOR CONSUMPTION AND ESTIMATED DUTIES COLLECTED, BY COUNTRIES

demand for goods long absent from American markets, partly to the admission duty free and without warehousing of most of the sugar imported into this country, and partly to reduced importations of tobacco and alcoholic liquors which together with sugar and wool are the important commodities most frequently warehoused.

COMMODITY REVENUE TREND

Strangely enough, the augmented customs revenue in 1946 took place in the face of diminished returns from the four commodity groups which have long been important sources of customs revenue, sugar, alcoholic beverages, tobacco, and agricultural products. Sugar, the leading source of customs revenue during most of the years in the past two decades, yielded only $9,216,007 during 1946, not because less sugar was imported but because of the policy of admitting it duty free for government distribution to consumers. With the lessening of restrictions on the use of domestic grains for production of alcoholic beverages, the demand for foreign alcoholic liquors abated and duties on such imports correspondingly declined. The comparatively small need in this country for imported oats and barley in 1946 accounted to a very large extent for the decline in the duties collected on agricultural products.

Duties collected under every other schedule of the Tariff Act, on the other hand, increased. Duties on raw wool reached the somewhat amazing total of $150,045,369, the largest revenue collected on this commodity for any year of this country's history, which was not only $42,506,327 more than was received from imports of raw wool in 1945, but also accounted for more than one-third of the entire customs revenue in 1946. Imports of materials which, during the war, had been absent from the American market or had been admitted in very limited quantities, caused collections under the remaining schedules of the Tariff Act to increase rather sharply. Duties on burlaps, which were practically off the market during the war, were 17 times as large as during 1945.

VALUES OF DUTIABLE AND TAXABLE IMPORTS FOR CONSUMPTION AND ESTIMATED DUTIES AND TAXES COLLECTED BY TARIFF SCHEDULES

(Fiscal Years 1945 and 1946)

Tariff Schedule	Value		Estimated Duties and Import Taxes[1]		Percentage Increase or Decrease (−)	
	1945	1946	1945	1946	Value	Duties
1. Chemicals, oils, and paints	$ 68,176,585	$ 70,598,327	$ 9,047,324	$ 10,959,060	3.6	21.1

Dutiable under Section 466, Tariff Act of 1930, etc.	1,032,940	1,116,126	551,687	461,824	8.1	−16.3
Total	1,198,884,492	1,592,190,968	343,086,849	429,406,738	32.8	25.2

---

[1] Taxes collected on dutiable commodities under the revenue acts and the Sugar Act of 1937 are included in appropriate schedules.

Precious stones yielded three times the revenue collected during the previous year. Manufactures of rayon and other synthetic textiles provided 11 times as much revenue, manufactures of silk four and one-half times as much, carpets twice as much, zinc six times as much, while watches and watch movements showed an 80 per cent increase, yielding $26,173,247 in revenue in 1946.

REVENUE TREND BY COUNTRIES

Although European imports were slow to arrive during the early part of the year, once space was available for bringing them to this country such goods began arriving in ever increasing quantities. As a result, total collections on European goods amounted in 1946 to $100,757,579 which resulted in more revenue from duties on European goods than from those from any other geographical area, the first time since 1940 that Europe occupied the dominant position as a source of customs revenue. Although some of the individual countries of Europe, long off the American market, yielded increased duties in fantastic ratios, Great Britain and Switzerland continued as the chief sources of revenue with the latter country accounting for far greater customs collections than the former, owing to the greatly increased volume of watches and watch movements received in 1946, for which Switzerland is almost the only source of supply. Spain and Portugal, which had been important sources of customs revenue during blackout of most of the rest of Europe, showed diminished revenues, and they were joined in this respect by Soviet Russia.

Wool was the determining factor in causing Australia to lead every other country in 1946 as a source of customs revenue, while the other important wool producing areas, Argentina, Uruguay, and the Union of South Africa, were also important sources of customs revenue, Argentina being third in importance among the countries of the world. Back in second place, after being for a single year the leading source of customs revenue, Canada despite its variety of materials desired in this country yielded less customs revenue than in 1945, and Cuba, with most of its sugar admitted free of duty, declined in importance to an even greater extent. With the shipping lines again open sharp increases in duty yield were recorded on goods from all the Asiatic countries, except Syria and the Netherlands East Indies, India the chief source of burlaps leading the way.

DUTY REFUNDS

Some duties are collected in excess of the amounts subsequently found to be actually due. The refunds of such excessive duties amounted to $4,089,176 in 1946 and $7,477,462 the previous year. Another type of refund, designated as drawback, is provided after the exportation under proper safeguards of merchandise previously imported. Such drawback aggregated $6.638,500 in 1946 and $6,895,847 in 1945. More than 99 per cent of the drawback allowed was on merchandise manufactured from imported materials; among the most important of these during 1946 were wool, sugar, coal-tar products, brass and bronze manufactures, and copper.

ENTRIES OF MERCHANDISE

The upward trend in the number of entries of merchandise continued for the third successive year. All the important types of entries, except in-

MERCHANDISE ENTRIES

	Number of Entries		Duties Collected		Percent of Increase or Decrease (−)	
	1945	1946	1945	1946	No. of Entries	Duties

formal entries, were more numerous than in 1945. The greater freedom of tourist travel accounted for the larger number of baggage entries while increased commercial activities were reflected in the greater number of consumption and warehouse entries.

INTERNATIONAL TRAFFIC

Border traffic for the fifth consecutive year increased in volume. More than 12,000,000 automobiles and buses entered the United States during 1946, carrying 41,636,686 passengers. With the increase in automobile traffic. however, the number of passenger trains and passengers on such trains declined. Vessel arrivals were more numerous, and the number of passengers arriving by vessel was greater than in 1945 and travel by air continued for the fifteenth consecutive year to increase rapidly. Aircraft to the number of 60,740 arrived in the United States from abroad during 1946, bringing 958,146 passengers.

LAW ENFORCEMENT

For the fifth successive year seizures for the violation of customs laws were more numerous than during the preceding year, the increase in 1946 being due to a larger number of seizures of narcotics, liquors, and prohibited articles, which offset a slight decline in the number of seizures of other merchandise. The increased tourist travel accounted for the greatly increased value of seizures of jewelry, wearing apparel, and furs, the articles which tourists most frequently attempt to smuggle. Despite the numerical increase of seizures in liquors, the quantity and value of alcoholic beverages were considerably less in 1945.

RAILROADS

By R. V. Fletcher

President, Association of American Railroads

GENERAL

Two major problems occupied the attention of the railroad industry in 1946. The first was readjustment in operations to meet the requirements of peacetime traffic. The second concerned the sharply rising level of operating costs, the result of substantial wage increases to employees, and higher unit prices paid for fuel, materials, and supplies.

The labor unrest that prevailed throughout the country for a considerable part of 1946 affected railroad operations. The strike of railroad engineers and trainmen in May, though brief, created a national emergency and occupied the full attention of the nation's leaders until the dispute was settled. Two strikes in the bituminous coal fields, in April–May and November–December, led to restricted passenger train operations and embargoes on freight shipments. Strikes in the automobile, steel, electrical supply, meat packing, maritime, and other industries upset the even flow of traffic and slowed the delivery of new equipment and other facilities needed by the railroads.

Notwithstanding interruptions caused by work stoppages, industry generally made rapid progress in the shift from war to peace production. Business activity, employment, and national income for the year as a whole were at record peacetime levels. Agricultural production reached a new all-time high. As a result, railroad freight traffic, while falling below the exceptionally high volume of the war years, was substantially greater than in any pre-war year.

FREIGHT AND PASSENGER TRAFFIC PROBLEMS

The characteristics of railroad freight traffic in 1946 created a number of operating problems. The heavy export program of foodstuffs and fuel to war-torn countries abroad, combined with reconversion and inventory needs of industry in this country, resulted in an unusual traffic pattern. Rearrangement of railroad operations to meet the situation was hindered by frequent strikes and by widespread adoption of the five-day work week in industrial plants. These developments adversely affected freight car utilization, because normal loading and unloading points were shut down for weeks at a time during strike periods, and because many cars lay idle on Saturdays and Sundays throughout the year awaiting loading or unloading. Troublesome freight car shortages developed, but 90 per cent of the demands of shippers for cars were met currently and promptly.

Railroad passenger traffic in 1946, while greater than in any pre-war year, declined substantially from the wartime level. Unlike the trend in freight traffic, which decreased substantially in the first half but recovered to some extent in the second half, passenger traffic continued a downward course throughout the year, and at an accelerating rate. Reduced military movements, the return of private automobiles to the highways in substantial numbers, and the considerable increase in air travel all contributed to the declining trend in railroad passenger business in 1946.

OPERATING COSTS

Railroad unit operating costs increased substantially in 1946. Wage rates of employees were increased about 20 per cent during the year, which when combined with the increases granted in 1941 and 1943 brought the level of railroad wage rates 51 per cent above 1939. Unit prices of fuel, materials, and supplies increased 13½ per cent, which brought the index of such prices 54 per cent above 1939. As a result of these increases in wages and prices, railroad operating costs in 1946 were more than $2,000,000,000 greater than they would have been had 1939 unit costs prevailed.

THE 1946 WAGE CASE

When war broke out in Europe in 1939, railroad employees in the United States were averaging 74 cents per straight time hour worked. Following the wage increases of 1941, the hourly wage rose to 83.5 cents, and was further advanced to 93 cents after the awards of 1943. In addition, vacation periods with pay were granted.

Shortly after the end of the war, the 20 standard unions representing railroad labor filed demands for further substantial increases in wage rates. Some of the demands also proposed certain changes in working rules. In January 1946, 18 of the unions agreed with railroad management to arbitrate the dispute. The Brotherhood of Railroad Trainmen and the Brotherhood of Locomotive Engineers refused to join the arbitration proceedings.

Two arbitration boards were appointed, one to hear the dispute involving non-operating forces (shopmen, maintenance of way workers, clerks, etc.), and the other for operating employees (firemen, conductors, and switchmen). Increases of 16 cents per hour, retroactive to Jan. 1, 1946, were awarded by these two boards, the reports being handed down April 3.

Meanwhile, on March 8, 1946, following a strike threat by the two unions not participating in the arbitration proceedings, President Truman appointed an Emergency Board to make recommendations for settlement. After hearing the case, the Board made its report April 18, also recommending an increase of 16 cents per hour for employees represented by the two unions, retroactive to Jan. 1, 1946. The 18 unions participating in the arbitration proceedings signed agreements accepting the awards but at the same time announced dissatisfaction with the amount of the increase. New demands for further increases were prepared and served on the railroads shortly thereafter.

The two unions representing trainmen and engineers rejected the recommendations of the Emergency Board and called a strike to begin May 18. On May 17, President Truman, by executive order, directed the Office of Defense Transportation to take over and operate the railroads for the United States Government. Shortly before the strike was scheduled to begin, a five-day truce was announced. Negotiations during the truce period failed to produce a settlement, so, at 4 p.m. May 23, trainmen and enginemen walked off their jobs, and railroad operations were greatly curtailed.

Two days later, May 25, President Truman announced that the strike had been called off and that the striking unions had agreed to accept an additional increase of 2½ cents per hour, effective May 22. The 18 unions not involved in the strike also accepted this additional increase of 2½ cents per hour, and withdrew their demands for further increases.

The two increases combined amounted to 18½ cents per hour, making a total increase in railroad payrolls, including payroll taxes, of $735,000,000 annually on the basis of 1946 employment. By reason of these increases, the aggregate railroad payroll in 1946 approximated $4,200,000,000, an average of $3,090 per employee, both figures being the highest on record.

Table I shows the trend in railroad employment and wages for the period 1939 to 1946. These statistics, as well as all other railroad data cited herein, apply to Class I railways which, as a group, earn about 97 per cent of the total operating revenues of all steam railways in the United States.

THE 1946 RATE CASE

Following the wage increases of 1941, railroads were authorized by the Interstate Commerce Commission to increase freight rates by about 4½ per cent and passenger fares by 10 per cent for the duration of the war and six months thereafter. These increases became effective in the early part of 1942. The freight rate increases were suspended May 15, 1943, after little more than one year's application. The passenger fare increase has remained in effect since first applied.

On April 15, 1946, shortly after the two Arbitration Boards had awarded the wage increases of 16 cents per hour, railroads petitioned the Interstate Commerce Commission to authorize freight rate increases averaging between 19 and 20 per cent, and to cancel the time limitation on the 1942 passenger fare increase. In view of the fact that the wage awards were retroactive to Jan. 1, and the further fact that prices of fuel, materials, and supplies had been rising steadily since the end of the war, the carriers asked permission to put the proposed increases into effect May 15, upon one day's notice, in advance of final hearings on and disposition of the petition.

After preliminary hearings in the early part of May, the Commission, June 20, 1946, authorized interim increases in freight rates averaging about 6 per cent, effective July 1, 1946. After further and more extended hearings, the Commission Dec.

TABLE I

RAILROAD EMPLOYMENT AND WAGES

Year	Average Number of Employees	Total Payroll (millions)	Average Compensation per Employee	
			Per Year	Per Straight Time Hour (cents)
1946*	1,360,000	$4,200	$3,090	112.0¢
1945	1,419,505	3,862	2,721	93.3
1944	1,414,776	3,858	2,727	93.0
1943	1,355,114	3,521	2,598	89.3
1942	1,270,687	2,932	2,307	83.5
1941	1,139,925	2,332	2,045	76.9
1940	1,026,848	1,964	1,913	74.2
1939	987,675	1,863	1,887	74.0

* Partially estimated.

5 canceled the interim increases and substituted increases averaging about 17.6 per cent, effective Jan. 1, 1947. At the same time, the 1942 passenger fare increases were continued in effect without expiration date.

The new freight rate increases will produce about $970,000,000 in additional freight revenue in 1947, based on the 1946 level of traffic. As the interim increases in effect in the last half of 1946 produced about $170,000,000, the net increase in freight revenues in 1947 over 1946 will approximate $800,000,000, assuming the same volume of traffic for the two years. The 1942 passenger fare increase, now on a permanent basis, may produce about $90,000,000 of additional passenger revenue, as compared with pre-war fares. These additional freight and passenger revenues will offset only about one-half of the increase in payrolls and purchases due to higher wage rates and unit prices since 1939.

On Oct. 28, the Interstate Commerce Commission authorized the Railway Express Agency to increase express rates by about 20 per cent. These increases went into effect Dec. 13, 1946.

The 1945 Land Grant Act, signed by President Truman on Dec. 12, 1945, became effective Oct. 1, 1946. This act repealed the reduced rates on government traffic provided for in the several acts granting lands in aid of railroad construction, some of which had been in effect since 1850. Through these reduced rates, the Government had been compensated many times over for the value of the lands granted.

Table II shows the average revenue received by Class I railroads per ton-mile of freight and per passenger-mile The trend in these averages from 1939 to 1946 indicates the extent to which railroad rates and fares lagged behind increases in wages and prices of fuel, materials, and supplies.

The freight rate increases, effective Jan. 1, 1947, will raise average revenue per ton-mile to about 1.1 cents in 1947, or about 13 per cent above 1939. The reduced volume of military furlough travel, which was handled on a round-trip basis at 1¼ cents per mile, will tend to raise average revenue per passenger-mile in 1947 to about 2 cents, or about 9 per cent above 1939. These increases in rates and fares are in sharp contrast to the increases of more than 50 per cent in wage rates and in prices of railroad fuel, materials, and supplies that have taken place over the same period of years.

TABLE II

RAILROAD REVENUE PER TON-MILE AND PER PASSENGER-MILE

Year	Average Revenue per Ton-Mile (cents)	Average Revenue per Passenger-Mile (cents)
1946*	0.975	1.950
1945	.959	1.871
1944	.949	1.874
1943	.933	1.882
1942	.932	1.916
1941	.935	1.753
1940	.945	1.754
1939	.973	1.839

* Partially estimated.

RAILROAD TRAFFIC

In 1944, at the peak of the war effort, railroads performed 737,000,000,000 freight ton-miles and 95,500,000,000 passenger-miles of service. This traffic represented increases over pre-war peaks of 65 per cent in freight service and 104 per cent in passenger service. These high percentages of increase take on added significance in view of the fact that the pre-war high in freight service occurred in 1929 and in passenger service as far back as 1920. Following those years, substantial declines took place in both freight and passenger traffic. Measuring the increases from 1939, the year in which the war began in Europe, freight traffic in 1944 showed an increase of 121 per cent and passenger traffic an increase of 322 per cent.

Freight traffic declined in 1945 to 681,000,000,000 ton-miles and passenger traffic to 91,700,000,000 passenger-miles, respective decreases of 8 and 4 per cent below 1944. Traffic declined further in 1946 to about 590,000,000,000 ton-miles and 65,000,000,-

000 passenger-miles, decreases below 1945 of 13 per cent and 29 per cent respectively. Practically all of the decrease in ton-miles occurred during the first half of 1946, as the volume in the second half was very nearly the same as in the corresponding period of 1945. This was not the case in passenger traffic, however, as the relative decrease of 19 per cent in the first half of the year was doubled (38 per cent) in the second half. Thus, the railroads entered 1947 with freight traffic leveled off about midway between the war and pre-war peaks. Passenger traffic, on the other hand, was still on a downward trend, with no indication that a leveling off point was being approached.

Table III shows ton-miles and passenger-miles of service performed by Class I railways in each year 1939 to 1946 and for the pre-war peak years of 1929 and 1920.

TABLE III

RAILROAD TRAFFIC

Year	Revenue Ton-Miles of Freight	Passenger-Miles
1946*	590,000,000,000	65,000,000,000
1945	681,000,757,000	91,717,226,000
1944	737,246,444,000	95,549,090,000
1943	727,075,495,000	87,819,503,000
1942	637,983,503,000	53,658,615,000
1941	475,072,001,000	29,350,229,000
1940	373,253,197,000	23,762,359,000
1939	333,438,412,000	22,651,334,000
1929	447,321,561,000	31,074,135,000
1920	410,306,210,000	46,848,668,000

* Partly estimated.

FINANCIAL RESULTS

At the time this is written, statistics of financial results of operation are available only for the first 11 months of 1946. A condensed income account for that period, compared with the corresponding months of 1945, 1944, and 1942, appears in Table IV. The year 1942 was the wartime year that produced the greatest net earnings in railroad history.

Total operating revenues declined by 15.6 per cent in the first 11 months of 1946, while operating expenses decreased only 4.6 per cent. As a result, net railway operating income, after paying operating expenses, taxes, and equipment and joint facility net rentals, declined 42.1 per cent below the same period of 1945, and net income, after interest and other fixed and contingent charges, decreased 61.1 per cent.

The effect of sharply rising operating costs is clearly reflected in a comparison of the 11-month results for 1946 with those of 1942. Notwithstanding the fact that total operating revenues in the 1946 period were greater than in the 1942 period, net railway operating income showed a reduction of more than 60 per cent and net income a drop of more than 75 per cent.

Even that picture of the sharp decline in net earnings fails to tell the whole story. The 1946 figures include nearly $100,000,000 of tax carry-back credits. This provision of the income tax law expired at the end of 1946, in so far as credits against excess profits taxes paid during the war years

TABLE IV

RAILROAD INCOME ACCOUNT

	First 11 Months			
	1946 (000,000)	1945 (000,000)	1944 (000,000)	1942 (000,000)
Operating revenues	$6,990	$8,285	$8,679	$6,763
Freight revenue	5,293	6,129	6,442	5,413
Passenger revenue	1,166	1,555	1,644	909
Operating expenses	5,808	6,087	5,726	4,170
Operating ratio—%	83.1	73.5	66.0	61.7
Taxes	528	1,146	1,735	1,119
Net railway operating income	516	891	1,033	1,310
Net income	197	507	623	823

are concerned, and will not be available in 1947.

RAILROAD LEGISLATION

Only one important piece of legislation affecting the railroads was enacted by the Congress in 1946—the Railroad Social Insurance Bill, also known as the Crosser Bill, signed by President Truman July 31, 1946. Enactment of the bill was vigorously opposed by the railroads, and other interests as well, because of its radical and far-reaching nature.

The act created a new system of annuities for survivors of railroad employees, increased the benefits payable under the railroad unemployment system, and applied the same schedule of benefits for unemployability due to sickness or injury from whatever cause. To cover the cost of this expanded program, the payroll tax rate paid by employers was raised from 6½ per cent to 8¾ per cent and that paid by employees from 3½ per cent to 5¾ per cent, effective Jan. 1, 1947. Based on current employment, the act increases railroad operating costs by approximately $90,000,000 annually.

Congress passed the Railroad Reorganization Bill, which dealt with reorganization of railroads in financial difficulty, through the process of voluntary agreement with their creditors and other security holders, in lieu of going through formal bankruptcy proceedings. However, President Truman vetoed the bill on the ground that it would not accomplish the designed purpose.

The Bulwinkle Bill, designed to harmonize the national transportation policy and the policy of the antitrust laws, was passed by the House of Representatives but failed to reach the floor of the Senate. The bill received extensive support from shippers, the Interstate Commerce Commission, railroads, and many others.

A bill to approve the 1941 agreement between the United States and Canada for construction of the St. Lawrence navigation and power project was reported favorably by the Senate Committee on Foreign Relations but did not come up for a vote on the floor of the Senate.

COURT ACTION

The United States Supreme Court had before it at the end of 1946 a number of matters of interest to the railroads. The Special Master appointed by the court in connection with the Georgia Antitrust Case received evidence during 1946 from the State of Georgia, complainant, and from the defendant railroads. Briefs were filed March 15, 1947, with reply briefs on April 1. Following oral arguments, the Master submitted to the court findings of fact and conclusions of law, together with a recommended decree.

The Supreme Court assigned the Class Rate Case (I.C.C. Dockets 28300 and 28310) for argument early in 1947. The decision of the Interstate Commerce Commission in those dockets was handed down May 15, 1945, ordering, among other things, an increase of 10 per cent in class rates in Official Territory and a reduction of 10 per cent in other territories east of the Rocky Mountains. Such changes in class rates were on an interim basis, pending subsequent establishment of a uniform freight classification and a uniform scale of class rates. Enforcement of the order was enjoined by the Federal District Court in northern New York. This action was appealed to the Supreme Court.

The decision of the Special Federal Court in Philadelphia, approving the sale of the sleeping car business of the Pullman Company to a group of railroads, was appealed by the Government and certain private interests. The Supreme Court has not yet set the date of hearing on this matter.

There was little change during 1946 in the status of the antitrust suit brought by the Department of Justice against the Association of American Railroads, the Western Association of Railway Executives, and others. The Government filed a bill of particulars Oct. 22, 1945, to which defendants filed answers March 3,

1946. The taking of evidence will begin on April 23, 1947.

RAILROAD COMMITTEE FOR THE STUDY OF TRANSPORTATION

The work of the several subcommittees of the Railroad Committee for the Study of Transportation was virtually completed in 1946. This is the committee of railroad men set up by the Association of American Railroads for the study of post-war prospects and problems. Some of the reports of the several subcommittees have been printed and distributed. There remains the task of consolidating these subcommittee reports into a final report of the committee, which will bring together in orderly sequence the results of the extensive research conducted by it into the details of the railroad plant and its operations, and prospective post-war developments. An early conclusion of the committee's work is anticipated.

JOHN J. PELLEY

The transportation world suffered a heavy loss in 1946 through the death of John J. Pelley Nov. 12. Mr. Pelley was the first president of the Association of American Railroads, holding the position from 1934 to the time of his death. He had a long and successful career in the railroad industry, and his wealth of experience and understanding was of incalculable value to the nation during the war period.

CONCLUSION

In many respects, the year 1946 was similar to 1919, the first complete post-war year following the First World War. In both those years, economic activity was greater than in any previous peacetime year, but was accompanied by rising wage rates and prices. In the earlier period, these trends continued in the second post-war year (1920) but the unbalances thus created in the national economy led to a depression in the third year (1921).

There now exists an adequate backlog of demand for goods to ensure an extended period of high industrial activity, but normal economic balances must be restored before the prospective benefits can be enjoyed.

HIGHWAYS

By THOMAS H. MACDONALD

COMMISSIONER OF PUBLIC ROADS, FEDERAL WORKS AGENCY

OBJECTIVES OF THE HIGHWAY PROGRAM

Roadbuilding activities in the United States during 1946 were retarded by unsettled economic conditions, high prices, and shortages of labor, materials, and equipment. Despite these handicaps, state and Federal agencies made a substantial beginning on the $3,000,000.000 post-war program authorized by the Federal-aid Highway Act of 1944.

The immediate objective of highway officials was the repair of heavily traveled highways which had become badly worn during the years of war activity. Replacement of obsolete surfaces had been stopped during those years, and maintenance was restricted to the most urgent repairs. Many highways had worn out under the ceaseless pounding of military traffic.

When wartime restrictions on roadbuilding operations were removed, shortly after V-J Day, state highway departments attacked the huge backlog of maintenance and surface replacement that had been deferred. At the same time steps were taken in every state to resume work on highway and bridge projects that had been suspended at the outbreak of war, and to get new projects under construction as quickly as possible. Numerous medium and small-size projects of particular urgency because of traffic conditions were placed under contract in many states during the closing months of 1945, and plans were made for contract lettings for major projects early in the 1946 construction season.

NATIONAL INTERSTATE HIGHWAY SYSTEM

Long-range planning under provisions of the Federal-aid Highway Act of 1944 calls for the development of a National Interstate Highway system connecting the principal cities and industrial areas throughout the country and the designation of a Federal-aid system of secondary or farm-to-market roads in each state. The proposed National Interstate Highway system will include crosstown expressways and circumferential routes in urban areas.

The act authorizes an appropriation of $225,000,000 in each of the first three post-war fiscal years to match state funds for improvements on rural and urban sections of the Federal-aid system; $150.000.000 for secondary roads, and $125.000.000 for work on sections of the Federal-aid system in urban areas.

The National Interstate Highway system will be limited to 40.000 miles in extent but will include the main highways in the Federal-aid system, as well as urban expressways and circumferential routes. No specific sum was authorized for development of the system; however, the act provides that funds authorized for projects on the regular Federal-aid system and for the improvement of Federal-aid routes in urban areas shall be available for work on the National Interstate system.

Summing up, the objectives of the current highway program are threefold: to improve existing routes in the Federal-aid system, to establish a National Interstate Highway system (including arterial thoroughfares in urban areas, on which extensive improvements will be made), and to designate in each state a system of secondary roads that will be improved with Federal assistance.

PROGRESS OF THE HIGHWAY PROGRAM

Highways completed with Federal funds totaled 2.964 miles during the fiscal year 1946, as compared with 4.011 miles in 1945, 5.695 miles in 1944, 8,445 miles in 1943, 10,178 miles in 1942, and 12,936 miles in 1941.

Completed highways consisted of 991 miles on the Federal-aid system, 294 miles of secondary or farm-to-market roads, 1,673 miles of access roads built for war purposes, and six miles of miscellaneous construction. Twenty-nine railroad grade crossings were eliminated, three obsolete structures were reconstructed, and 65 crossings were protected by signals or other devices. The total cost of all completed work was $103.812,655, of which $76,448,942 or 74 per cent was paid by the Federal Government.

Highway programs approved during the year amounted to $390,961,936 for proposed improvements on rural sections of the Federal-aid system, $156.115,814 for work on portions of the Federal-aid system in urban areas, and $225,452,796 for secondary roads.

Between Jan. 1 and Sept. 30, 1946, contracts were awarded for 2,857 Federal and Federal-aid highway projects estimated to cost $395,000.000. These contracts called for improvements on 14.383 miles of road in 48 states and the District of Columbia, and included projects in national forest and other Federal areas. Contracts awarded in the total Federal and state programs were for 36,840 miles of road to cost $574,000,000.

MAJOR ROUTES AND EXPRESS HIGHWAYS

Agreement between the states and the Public Roads Administration of the Federal Works Agency upon routes designated for inclusion in the National Interstate Highway system was expected by the end of the year, after careful consideration and coordination of state proposals. The mileage proposed by the various states considerably exceeded the legal limit of 40,000 miles, and in a number of instances the routes proposed by adjacent states did not meet at state boundaries. After eliminating routes which did not appear to be wholly justified and making necessary adjustments so that all routes would be continuous across state lines, there resulted a total of 37,324 miles in the system of main routes as integrated by the Public Roads Administration. The reserve of 2,676 miles will be assigned to circumferential and distribution routes in cities at a later time.

The National Interstate Highway system eventually will connect all our large cities and densely populated industrial areas with broad, modern highways over which traffic will flow freely. Urban sections of the system will pass directly through our largest cities on express routes to which access will be permitted only at selected points.

In the new plan of highway development the extension of major routes through cities as express highways is one of the most important features. The most serious traffic problems are in and near cities, and it is there that traffic accidents are most frequent. Improvements that will permit a free flow of traffic on principal routes through cities are essential, not only to complete a national system of highways but to prevent strangulation of the economic life of cities.

SECONDARY ROADS

During the 1946 fiscal year good progress was made by county, state and Federal officials in the selection of secondary road systems and a start was made on the construction program, despite adverse conditions. At the end of the fiscal year a total of 217,073 miles of road had been approved for inclusion in the Federal-aid secondary system, and a large mileage of additions to the system was under review.

No limit was placed upon the mileage of secondary road systems, but the states were urged to include only such mileage as could be adequately improved within a reasonable period of years and maintained with revenues that may be expected to accrue.

The improvement of secondary roads was well advanced in many states and begun in others before the war. Under earlier legislation, Federal-aid secondary road systems or partial systems had been selected and approved for 35 states. The Federal-aid Highway Act of 1944 requires that a system of secondary roads be selected in all states. The selection must be made in cooperation with local officials except in the few states in which all public roads are under direct control of the state highway departments.

The purpose of the legislation is to initiate a more comprehensive rural road program through the selection and improvement of a system of principal secondary roads to supplement the Federal-aid highway system in rural areas. Together, the two systems will form a closely integrated network of trunk routes and "feeder" roads.

NATIONAL FORESTS AND PARKS

During the war normal construction of highways in national forests and parks was stopped. A considerable portion of the technical personnel entered military service. Many of the men who remained were engaged in supervising the construction of access roads to sources of timber and mineral deposits needed for the war effort. Others were at work on war-connected projects such as the Alaska Highway, and roads to atomic plants and to other war establishments.

When the war ended, every available man was assigned to the preparation of plans for urgently needed improvements. These will be financed wholly by the Federal Government. The Federal-aid Highway Act of 1944 authorizes an appropriation of $25,000,000 for national forest highways, $4,250,000 for highways in national parks, and $10,000,000 for parkways, in each of the first three post-war fiscal years. An additional fund of $1,500,000 for the maintenance and reconstruction of forest highways was provided by the Department of Agriculture appropriation bill for the fiscal year ended June 30, 1946.

Over 80 per cent of the Forest Highway system consists of links in the Federal-aid and state systems. Completed portions of the system carry a considerable volume of traffic. The new funds will make it possible to modernize these roads and provide the same safety and facility of travel found on adjacent sections of main highways. Some new highways will be built, but emphasis will be on modernization of the older and most-used forest highways.

At the beginning of the 1946 construction season plans had been completed for projects that would absorb all national park and forest highway funds available for the fiscal year; however, only a few projects were advanced to the construction stage because of high prices and the reluctance of contractors to bid on jobs. Construction activities will be expanded when conditions improve.

MOTOR VEHICLE REGISTRATION

Despite limited production of new vehicles, the number of privately owned automobiles and trucks registered in 1946 was expected to reach a total of 32,511,000, an increase of 1,984,824 or 6.5 per cent over 1945 registrations. This figure, however, was 1,872,345 or 5.4 per cent fewer than the 34,383,345 privately owned automobiles and trucks registered in 1941, when motor vehicle registrations reached an all-time peak. It was estimated that 27,088,000 automobiles and 5,423,000 trucks would be registered in 1946, as compared with 25,691,434 automobile and 4,834,742 truck registrations in 1945. California, New York and Pennsylvania, in the order named, led all other states in motor vehicle registrations.

INTER-AMERICAN HIGHWAY

During the year moderate progress was made in the construction of the Inter-American Highway, which stretches from Laredo, Tex., through Mexico and the six Central American republics to Panama City, Panama, a distance of approximately 3,300 miles.

Work on the section through Mexico is directed and financed by the Mexican Government. In the Central American republics the United States is cooperating, through the Public Roads Administration, with the various governments in financing and constructing sections of the highway. Currently, assistance is being given from a fund of $20,000,000 authorized by the Act of Dec. 26, 1941. Financial aid from this country is limited to two-thirds of the cost.

Construction activities, both in Mexico and Central America, have been retarded by the difficulty of obtaining new roadbuilding equipment, spare parts, and supplies from the United States. Most of the equipment now in use has served beyond its economical life. Until this situation is remedied, progress will continue to lag.

From Laredo south through Mexico City and Oaxaca to Totolapa, a distance of about 1,126 miles, the highway has a continuously paved or all-weather surface over which travel is pleasant at all times. South of Totolapa there are stretches over which travel is possible in the dry season but they end with a jungle barrier that makes it impossible for the motorist to reach Guatemala.

There is considerable local travel on the highway in Guatemala, El Salvador, Honduras, and Nicaragua, but in the last two countries travel is difficult in the wet season.

Considerable progress was made during the year on sections of the highway in Costa Rica, but long gaps are still to be completed. It is not possible to reach Panama by overland travel through Costa Rica. In Panama, except for some 25 miles near the Costa Rican border on which no work has been done, the Inter-American Highway is passable at all times.

PAN-AMERICAN HIGHWAY

This highway coincides with the Inter-American Highway to Panama and extends down the west coast of South America, across the Andes to Buenos Aires, and northward to Rio de Janeiro. The section from the Colombia-Panama border to Buenos Aires is 5,400 miles in length. Local improvements were made during the year on portions of the highway, notably in Bolivia and Ecuador, but the highway as a whole is not yet suitable for tourist travel.

THE MOTOR BUS INDUSTRY

By Carl W. Stocks
Editor, *Bus Transportation*

POST-WAR FACTORS

Despite many misgivings as to the probable trend of riding, the bus industry in its first full post-war year of operation held close to the high level of riding that characterized its operation for the last several years. It will be some time well into the new year before the full figures of passengers carried on the city, city-suburban, and intercity lines are available, but as the year drew to a close there was every evidence that the final figures for 1946 would compare satisfactorily with the 1945 total of 9,742,000,000. The change was in the character of the riding rather than in the demand for service. This was accounted for largely by continued change from a wartime to a peacetime economy and led to the institution of many revisions in administrative and operating procedures by the carriers. There was, of course, great need on the part of the carriers for new vehicles for additions to the fleets and for replacement purposes. Despite the fact that strikes in the coal, steel, and automobile industries hampered the manufacturers, bus production set an all-time high of 24,174 vehicles, of which 12,025 were school buses, 11,635 common carriers, and 496 were for government agencies. The comparable total figure for 1945 was 17,651.

INCREASE IN TRUCKING LOADING

Again, in the truck industry, the full figures for the year will not be available until well into the new year. Here also the general trend has run counter to some of the predictions of a precipitate drop in loadings. There was a temporary slump in this industry in September caused by strikes, but in October two new records were established. The truck loading index figure, computed on the basis of the average monthly tonnage of the reporting carriers for the three-year period 1938-1940 as representing 100, climbed to 204 in October, the highest October index recorded since the American Trucking Association began keeping records in 1937. Moreover, the 204 index in October, following an identical 204 index for August, makes 1946 the first year of record in which the index has exceeded 200 in more than one month. The index has equalled or exceeded 200 on only two other occasions: 200 in April, 1943, and 205 in March, 1945. The average index for the first ten months of 1946 was 182. It is exceeded only by the average of 187 recorded in the first ten months of 1943. The average for the first ten months of 1945 was 179. The October volume represented an increase of 16.9 per cent.

This, then, is a measure of the extent to which the carrier industry conducted operations in the face of tremendous shortages of vehicles and parts, but at the same time it is a measure of the extent to which the manufacturers of vehicles and parts carried on in the face of strikes and in turn shortages of materials that enter into their products. The matter has been well expressed in the statement that the great cost of this labor orgy has been borne, first, by the public; second, by the operators; and, third, by the manufacturers themselves. One of the bright spots in the production figure, however, was the announcement in August that the supply of bus and truck tires had caught up with wartime shortages. Actual truck assembly in 1946 was 935,000, or 89 per cent of the 1941 figure of 1,042,085, but that figure included 219,000 military vehicles.

SHARPLY INCREASED COSTS

All the highway carriers had to contend against increased costs of vehicles, increased costs of materials and supplies, and increased wages. They were able to offset these added costs only in part by technological improvements in the conduct of their business. In general it may be said that labor and material costs spiralled dizzily upward faster than the increased revenues.

CHANGES IN BUS EQUIPMENT

In the bus field many notable and progressive innovations were introduced during the year. Not only were there new types of equipment, but there were notable changes in operating and administrative procedure. In San Antonio a new 36-passenger air-conditioned bus was placed in operation as the precursor of 100 more similar vehicles. There have been air-conditioned intercity coaches, but this was the first instance of a bus of this kind intended for city operation. Trolley buses intended for use in Atlanta are to be similarly air-conditioned. Another innovation was the prefabricated trolley bus tested in Toledo, but intended for use in Buenos Aires as part of an order for 200 vehicles. In the intercity bus field, Santa Fe Trailways unfolded for public use a new 60-foot articulated luxury coach, and in the spring Greyhound began experimental operation of a Sikorsky helicopter intended for air-bus service which in flights near Detroit landed on schedule to connect with the intercity buses.

CHANGES IN OPERATING AND ADMINISTRATIVE PROCEDURE

The last of the trolley cars in Manhattan are on the way out under a conversion to bus operation program of the Third Avenue Transit Corporation, calling for the expenditure of more than $10,000,000. Moreover, in New York City the Fifth Avenue Coach Company completed the plan under which the last of its open-top double-deck buses were retired from service, the change being celebrated in a ceremony on Dec. 29 in which officials of the company and invited guests participated. The only remaining street car lines in Manhattan are the Third Avenue line and the upper Broadway line. These are to be converted to bus operation in 1947. Among the cities which converted to all-bus operation during 1946 were Savannah, Albany, Troy, Worcester, Salt Lake City, Schenectady, and Fitchburg.

COMMUNITY TRANSIT

By Guy C. Hecker

Executive Manager, American Transit Association

TRAFFIC FACTORS

In 1946, the community transit systems of the country carried 23,500,000,000 passengers, thus, once again and quite unexpectedly, establishing a new peak of traffic. When traffic in 1945 reached 23,254,000,000 passengers, it was confidently believed that the top had been reached, that it would be a long time, if ever, before so many passengers would be carried in one year again. Conditions prevailing a year ago suggested that a recession was inevitable; in fact, there were indications that it had already begun. However, the situation did not work out as anticipated. Nothing particularly startling occurred nor is there anything now to indicate that there has been any fundamental change in the outlook. It appears, rather, that developments have been delayed; the expected denouement has been put off. Community transit travel in 1946, therefore, continued at its high wartime levels and even edged slightly higher.

The dominant factor in the situation has been the maintenance of a high level of industrial and business activity. There was a period of hesitation and uncertainty in the latter months of 1945 and the early months of 1946, and then production turned upward again. Employment climbed to record high levels and held steady there, and high employment with plentiful spending money spells heavy riding on transit lines.

Another factor influencing the volume of transit riding in 1946 to some extent was the slowness of the automobile industry in getting into full production. It is believed this factor was most potent in the smaller cities and towns where normally the registration of automobiles is most dense and their use most intensive. Whether the volume of transit riding affected by this factor is important in relation to the total volume of transit riding seems open to question however. More important is the increasing traffic congestion in city streets and the problem of parking. To relieve the congestion, more and more cities are restricting the parking privilege, and thus restricting the use of private automobiles. To the strain of driving in congested traffic is added the necessity of parking a considerable distance from one's destination or the expense of off-street parking.

With the exception of the surface street car lines, all types of community transit service experienced increases in passenger traffic. The decrease in street cars was caused by conversions to motor buses in a number of cities. A considerable part of the increase of the motor bus traffic has been due also to these conversions, the remainder to extensions of bus lines and the general upward trend of traffic.

The greatest increase in traffic occurred on the rapid transit lines. It can be attributed principally to the influence of the City of New York where transit experienced a mild boom owing to the high level of employment prevailing and to a post-

TRANSIT OPERATIONS IN 1946

	Calendar Year 1946 (Prelim. Estimate) (Millions)	Calendar Year 1945 (Millions)	Per Cent Change from 1945
Transit Passenger Traffic			
Surface Street Car	9,096	9,426	−3.50
